

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

CORRESPONDENCE.

THE most important part of the late news from England, is the great stride which Sir Robert Peel has made in the direction of Free Trade. He has entirely taken the duties off about four hundred articles, which yielded about seven millions to the revenue. Among those free articles are *cotton*,—which paid a duty of about a cent and a quarter a pound,—pearl ashes, lard oil, and many other articles which may now be largely shipped from the United States. We are especially pleased that many of these articles are the produce of the western country, which will thus be brought into closer connexion with England, and will not be so ready to quarrel with a good customer.

If we may put the church after the state, the news next interesting is the action of the University of Oxford upon Mr. Ward's book. It was decided by more than two to one, that passages of this book were contrary to the doctrine of the Church of England, and inconsistent with good faith in Mr. Ward, who had obtained preferment by subscribing her articles. Upon the question of degrading Mr. Ward, many persons doubted the authority of the convocation—but there was still a considerable majority by which it was done. It was then proposed to proceed to condemn Tract No. 90, but the proctors interposed their veto against the consideration of the subject, so that nothing was done in that matter.

Lord John Russell spoke of the state of affairs "across the Atlantic," as a reason why parliament should be contented with no *small* surplus in the Treasury.

There is a startling coincidence of allusions to commercial troubles, as if our "prosperity" were already hurrying us over the brink into the vortex of a "commercial crisis," such as signalized the years 1825-6 and 1835-6. In the distant west, an American paper describes a process of speculation which, after enriching European capitalists, has tempted Americans into such a scramble of exports and imports as to anticipate the genuine movements of trade, to glut the markets on both sides, and to induce a reaction. In the far East—in China—the way to the immense market opened to us has, as we foresaw, been choked by rash enterprise, heaping the Chinese with goods of which they have yet to learn the want, and for which they have no means of exchange; while the same rash enterprise has put the tea-trade into a temporary state of congestion. They have as yet nothing to give us legitimately but tea; but we do not want more tea while it is so dear in this country; and it must continue as dear while the duties in this country are so enormous. It is of no use, therefore, to smother them with ginghams and broadcloths, which they do not want and cannot buy; yet they have been so smothered, and the exporters may bring upon themselves the usual consequences. Signs are observed at home. Lord Howick has denounced the inordinate and demoralizing speculation in railway shares; a game of hazard in which the board of trade throw the dice, and the gamblers, staking little fortunes, play for millions—staking ruin against infinite riches. The commercial Argus of the *Times* has discovered other tokens of a coming crash:

"Letters are constantly received denouncing the directors of joint-stock companies for all sorts of irregular practices; including the formation of them with insufficient means; the withholding of shares from *bona fide* subscribers, and selling them surreptitiously at a large premium at the same time; and finally a resort to the old and nefarious

system of 'rigging,' so often exposed on former occasions—which means the purchase for a time of a larger number of shares than are known to have been issued, which subjects the sellers on the day of settlement to such terms as the fraudulent buyers may think fit to impose."

There may be exaggeration in these vaticinations; but our prosperity is certainly alarming. The fatal day approaches, while we make merry in the city with festive wreaths:

"Fatis aperit Cassandra futuris
Ora, Dei jussu non unquam credita Teucris."
Spectator, 15 Feb.

In the House of Commons, on 25 February, Sir Robert Inglis, moving for papers, drew attention to the compulsory emigration of liberated Africans from Sierra Leone. Up to the year 1844, the British government acted upon a liberal construction of the order in council issued on the abolition of the slave-trade, "that when landed in any place where there is a Court of Mixed Commission, the slave should be protected and provided for." Sir Robert briefly recalled the horrors to which slaves are subjected in the passage from Africa—horrors unavoidably protracted after the capture of a slaver until its arrival in port; so that the negroes, as Governor Nicolls said, "come out of the ships like ghosts." On the 12th June last, the Governor of Sierra Leone issued a proclamation under the authority of the colonial office, that allowances to liberated Africans landed in the colony would cease after adjudication; clothing and maintenance before adjudication being continued as before; and that should they prefer remaining in that colony instead of emigrating to the West Indies, they must provide for themselves. Now it is extremely improbable that persons landed under the circumstances described could exercise a fair and real discretion as to whether they would remain or migrate. Among the liberated Africans is a great proportion of children; in the *Progreso*, in which the Reverend Pasco Hill, author of a *Narrative of Fifty Days on board a Slaver*, took a voyage, there were 213 children out of 447 blacks: it is a mockery to give choice and option to the children, if even they could be given to the grown-up men. The governor, in fact, withheld the operation of the proclamation as to all children under nine years of age. Sir Robert contended that the government, having taken upon itself, by a benevolent despotism, the charge of the slaves, who have as little a choice of their own after the capture of a slaver as before it, cannot absolve themselves from the implied compact under which 52,000 Africans have been introduced into Sierra Leone and provided for. It has been said that the colony is expensive; but, taking the expenditure at an average of 10,000*l.* a year, is it not the fact that the revenue exceeds the expenditure? In that colony the Africans have extraordinary opportunities of education; and about one fifth of the population are under a course of instruction. Yet, in June last, liberated African children were required, under a peremptory order of the governor, either to be taken out to the people located in the villages, or to migrate to the West Indies; and 100 boys and girls actually did migrate. He did not object to admitting into the West Indies those who are really free; but this so-called option is like Dr. Johnson's description of a *congé d'élire*, which is recommending a man thrown out of a window to fall softly to the ground. Sir

Robert Inglis condemned also the preponderance of males who are allowed to migrate to the West Indies. He adverted to attempts made to obtain free laborers on the coast of Africa for Mauritius; contending that the demand would be supplied, like that for slaves, by the African kings, who possess an absolute property in their own subjects, and send them, or make inroads into other countries for prisoners of war. He called upon the house not to weigh the purse of the West Indians against the blood and lives of the Africans.

INTERNATIONAL COPYRIGHT.—In reply to Lord Mahon, on Monday, Sir Robert Peel said, that negotiations had been entered into on this subject with France, Belgium, and Saxony, for the purpose of giving facilities to the book-trade in those countries and in this. These negotiations were carried on for some time, but they did not lead to any final or satisfactory result. Negotiations were afterwards entered into with Prussia; and after a certain time it was alleged, on the part of Prussia, that the law of copyright in this country was defective and ought to be amended. Since that time, two bills had passed parliament to amend the law of copyright. The negotiations with Prussia were now renewed; and in the event of their being brought to a satisfactory conclusion, they might perhaps form the basis for the renewal of negotiations with other countries.—*Spectator*.

BOOKS RECEIVED.

From Messrs. Harper & Brothers, New York.

HARPERS' ILLUMINATED AND ILLUSTRATED BIBLE, No. 21. This work comes out very rapidly now. Among the other pictures is one of Mordecai sitting in the King's Gate unmoved as Haman passes by—and it really was very provoking.

THIRLWALL'S HISTORY OF GREECE, No. 8. 25 cents.

COPLAND'S DICTIONARY OF PRACTICAL MEDICINE, Part 4. 50 cents. Edited, with additions, by Charles A. Lee, M.D. This has a very lively Table of Contents on the cover, beginning Colic, Colon, Coma, Concretions, Congestions, &c.

HARPERS' ILLUSTRATED SHAKESPEARE, Nos. 43—44. Much Ado about Nothing. Price 25 cents.

From Greeley & McElrath, New York.

POPULAR LECTURES ON ASTRONOMY. By M. Arago. With Additions and Corrections by Dr. Lardner. Price 25 cents. Dr. Lardner's Lectures have so much excited popular attention to the subject of Astronomy, that we presume this work will meet with the extensive sale it deserves.

The publishers have heretofore been issuing a series of "*Useful Works for the People*," the old stock of which was destroyed in the fire which lately consumed the office of the New York Tribune—and this is a new beginning.

We are far from agreeing with all the opinions of the New York Tribune; but it is conducted with so much energy, and (so far as we can judge) with such entire honesty of purpose, that we rejoice in its success, and wish well to all its collateral business—not doubting that the same desire to *deserve* well of the public, will guide the selection which the publishers make of books for the market.

From the Edinburgh Review.

Political Philosophy. In Three Parts. Part First. Principles of Government—of Monarchical Government. Part Second. Of Aristocracy—Aristocratic Governments. Part Third. Of Democracy—Mixed Monarchy. By HENRY LORD BROUGHAM, F. R. S., Member of the Royal Institute of France Three Volumes. 8vo. London: 1842-44.

This work was published, as may be seen by the dates, at successive periods. On the appearance of the first number, we expressed our satisfaction at a beginning being made to supply a great deficiency in our Political Literature; and we promised to examine and report on the whole work when it should be concluded. If any apology for our not having sooner performed this promise be due, either to the public or to the distinguished author, it is to be found, partly in the great extent and difficulty of the subject, and partly in the manner in which he has treated it.

The influence on human affairs of different forms of government, may be considered historically, theoretically, or practically: or, in other words, may be made the subject of a history, a science, or an art. The writer may describe the nature, and relate the origin, the growth, and the fate of the principal political constitutions which have actually existed. He may tell the causes—some the result of design, but more of accident—through which the early simple governments, in some cases, were preserved unaltered; in others were changed from one pure form into another; and in others became mixed. He may show how the mixed forms gradually grew more and more complicated; until at length the system of divided powers, of balances, and of checks, became unmanageable, and the machine, unfit to resist attack, or perhaps even to bear the friction of its own ordinary working, was broken up by foreign conquest or by revolution. This is the historical treatment of the subject.

Or, instead of relating what has existed, he may show what is capable of existing. He may explain the different modes in which the supreme power may be distributed or collected, the effects which it is the tendency of each form to produce, and the modifications to which that tendency is subject from intrinsic and extrinsic accidents—from the intrinsic influence of race, religion, climate, and situation, and the extrinsic action of one nation upon another. This is the scientific treatment.

Or, lastly, assuming that those who have the power of creating or altering the constitution of a nation have some given end in view—its power, its wealth, its freedom, its tranquillity, or its intelligence—he may show what is the constitution under which, in any particular case, any one or more of these objects is most likely to be effected, what are the incidental sacrifices, and how these sacrifices may be diminished. This may be called practical politics, or the *art*, as distinguished from the *science* and the *history* of government.

Whichever of these three modes of treating the vast subject of government were adopted, it could not be considered adequately except at great length. Lord Brougham has united them, and has therefore been forced to compress into one treatise the matter of three. This, of course, has rendered his work more complete in its outline, and less so in its details; and has also impaired

the continuity and cohesion of its parts. It has rendered it more useful as a book, and less perfect as a treatise. It is a sacrifice of artistical merit to utility.

By far the largest portion of the work is purely historical. Of the twenty chapters of the first volume, the last ten are devoted to the history of Monarchy in France, Germany, Italy, Spain, Portugal, Denmark, and Sweden; and the greater part of the remainder is employed in the history of the Asiatic despotisms, and of the feudal system. The second volume contains twenty-eight chapters, of which only the first six treat of the nature and consequences of aristocratic government; the remaining twenty-two being histories of the aristocracies of Poland, Hungary, Rome, Ancient Greece, Modern Italy, and Switzerland. The third volume contains thirty-five chapters, of which the first twenty-one treat of democracy and mixed government; and the rest contain the constitutional histories of England, the United States, France, Holland, Belgium, and Switzerland. Throughout are dispersed disquisitions as to the influence on human happiness of different administrative institutions, and precepts as to the modes by which they may be best adapted to given political forms; and frequently, after noticing the defects of existing institutions, the means of remedying them are pointed out.

For this mixture of narrative, of philosophical exposition, and of positive precept, so far as we are merely a part of the public, we are grateful; but as Reviewers, we feel that it gives us only a choice of difficulties. Anything like a general view of the whole work would be a condensed and yet meagre abstract; and if we select portions, and give to them their due consideration, a very few will be all to which we can afford any attention.

The historical part we shall not criticise—not certainly because we undervalue it—it is executed with great research and sagacity, and contains many brilliant and clear condensations, many striking comparisons and contrasts, and much valuable criticism, both historical and political—but simply because we have not room for it. From the practical portion, we shall select for examination a very few of the most important, or the most remarkable passages. Of the scientific portion, we shall endeavor to give an outline as full as is consistent, not with the importance of the subject, or of the treatise, but with our confined limits.

In the first chapter, Lord Brougham inquires into the origin of civil governments. He disposes summarily but efficiently of the rival theories of original contract, proprietary right, and prescription; and asserts that the rational foundation of all government—the origin of a right to govern, and a correlative duty to obey—is expediency—the general benefit of the community. In the second chapter, after stating the generally admitted proposition, that in every state there must be a supreme power, an individual or a body possessing authority in itself, legally absolute and uncontrolled, and that this authority may be exercised by acts, either legislative or executive, he proceeds, in the following passages, to give an outline of his subject, and to mark its principal divisions:—

“There are three great divisions under which governments, where they are of the simple and unmixed form, may be classed according to the hands in which the supreme power is lodged. It

may be vested in a single person, or it may be vested in a particular class different from the bulk of the community, or it may be vested in the community at large. In the first case, the government is called a Monarchy; in the second, an Aristocracy; in the third, a Democracy.

"In order that any one of these forms of government should be pure, the supreme power should be vested in one of these three bodies or authorities exclusively, and without any control or check from any other. A pure or absolute monarchy implies that the sovereign should have the whole power, legislative and executive, in his own person. If his power is shared, or if his functions are exercised subject to any control or check, the government is no longer purely monarchical, but in some degree mixed. In like manner, if the aristocracy shares its authority with the people at large, or allows any check over its operations to the people at large, or to any individual functionary *over whose creation it has no control*, the government is no longer a pure but a mixed Aristocracy—and so of a Democracy.

"It must, however, be kept in mind, that in order to detract from the purity of any of these forms, the supreme power itself must be actually divided, and not merely an arrangement made voluntarily by the party having the supreme power, and which only subsists during that party's pleasure.

"In a monarchy, the choice by the sovereign of a council to aid him in his office, or to exercise a portion of his power, does not detract from his power, and does not render the government a mixed one. [So,] if the sovereign can do whatever he pleases, except that the judges of his own nomination act for life—in other words, if all he is prevented from doing is judging causes in his own person—if he is independent of all other control in his legislative and executive functions, and only restrained by being obliged to judge through persons of his own nomination, even if these are named by him for life—we call it an absolute, and not a mixed monarchy. The limitations arising from this judicial arrangement are plainly little more than nominal, because he may choose such tools as he can rely upon, and has no one to control or watch his choice.

"Again, the purity of the democratic form is not diminished, by arrangements made for the purpose of enabling a people inhabiting an extensive territory to administer its own affairs. It may delegate for this purpose the legislative, the executive, and the judicial power to individuals as to bodies; it may be satisfied that these should be vested in certain portions of the community, and none remain in the nation at large, except the choice of those ruling portions; and still the government is purely democratic, and not at all mixed, because no body or individual exists in the community having power independent of the people—and because the people have not shared their own power with others over whom they have no control, but only deputed others to exercise their authority."⁶

We doubt whether Lord Brougham adopts a convenient nomenclature, when he applies the epithet pure to a monarchy in which there are irremovable functionaries, or to a democracy in which the people act through representatives. How can an absolute monarch be *prevented* from judging

causes in his own person? How can he be *obliged* to allow the judges whom he finds, or whom he has nominated, to retain their offices for life? The power that restrains or coerces him must at least be equal to his own, and in that case he is not, in fact, absolute—the constitution is not a pure monarchy. Again, if the people at large have retained, or rather have proposed to retain, no power but that of electing legislative and executive functionaries, it is clear that they hold that power merely at the will of those whom they have elected. The legislative body elected for three years, may pass a law that it shall sit for seven, or that it shall sit so long as it pleases, or that it shall be elected by only a portion of the people, or that it shall appoint its own successors, or that its powers shall be hereditary. If it be answered, that it would not venture to do so, the reply is, that the fear of resistance operates as a practical check on all governments whatsoever. Even in the purest democracy, the majority is controlled by the fear of provoking the resistance of the minority. But we have seen that there must exist, in every state, a supreme power uncontrolled by law. We are now inquiring as to the modes in which this supreme power may be distributed or collected, and for the purposes of this inquiry the question always is, what the individuals, or the bodies possessing a portion of this power, legally *can* do—not what they are *likely* to do; their *εξουσία*, not their *δυναμις*. Even if we suppose the delegation of legislative power to be partial as well as temporary—if we suppose that the people at large retains exclusively to itself, not merely the right of election, but also the power of altering the more important parts of the constitution—as is the case in the United States—can it be maintained, that the constitution remains equally democratic, whatever be the period for which that partial delegation is made? Can it be said, that if in one country the legislative and executive functionaries are elected for life, in another for twenty years, in another for ten, and in another every six months, the management of affairs in each country equally depends on the will of the people? And if the delegation of power for twenty years impair the purity of the democratic principle, so must, *pro tanto*, its delegation for six months, or for one month.

Lord Brougham admits, that if an aristocracy allows any check on its proceedings to an individual functionary, *over whose creation it has no control*, it is no longer a pure aristocracy. But if that check be effectual, it is *pro tanto* an introduction of the monarchical principle, even though the individual functionary be created by the aristocratic body. If, in a purely aristocratic government, the aristocratic body make a law appointing a president for life, and requiring his concurrence in all subsequent legislation, the government is from that instant partly monarchical. The will of an individual can now control that of the whole community. Like the horse in the fable, the community has taken a bit into its mouth and a rider on its back. And the effect is the same in kind, though not in degree, whether the president be appointed for life, or for ten years, or for a month, whether we have an absolute or only a suspensive veto.

The result is, that to obtain a precise nomenclature, we must confine the term pure monarchy to the form of government in which an individual is legally omnipotent—the term pure aristocracy to the form which allows no legal resistance to the

* Vol. i., p. 73 to 77.

will of the select body—and the term democracy to the form in which there is nothing to suspend or impede the action of the will of the bulk of the community.

It follows also, that the only form which is frequently found pure is monarchy. There are few aristocracies without a doge or a president, exercising a temporary but real control. Still more rare is a pure democracy. It is impossible in any state which is not small enough to enable all the inhabitants to attend the place of meeting; and even where there are no physical objections, the moral ones are generally sufficient to exclude it.

The majority of the forms adopted by the civilized world do not belong exclusively to either of these classes, but admit the principles of all. They are not monarchies, aristocracies, or democracies, but mixed forms, in which it is often difficult to say whether the monarchical, the aristocratic, or the democratic principle prevails.

It may be advisable, however, to state more fully what we mean by each of these principles.

The monarchical principle requires little further explanation. It consists, as we have already remarked, in the subservience of the will of the whole community to that of an individual. It is not essential to monarchical power that this subservience should be universal, or even general: it is not essential even that the individual should have the power to command. If there are any acts in which his concurrence is necessary, and there is no authority that can legally force him to concur, his power to prevent is, for many purposes, a power to act, just as a power to forbid is often equivalent to a power to command. It is, however, essential that he should form a part of the legislative body, not merely as a member, but as an independent branch; or, in other words, that he should have a veto, permanent or suspensive. If he have not, his opposition may at any time be legally got rid of either by a law, or by an arbitrary executive act. The President of the United States, therefore, has monarchical power; he can resist, and indeed often has resisted, the will of the community. The Doge of Venice had not. In his highest functions he was only a member of a council, unable to oppose the will of the majority.

The aristocratic principle consists in the possession of legislative power by a small body of persons.

The democratic principle consists in its possession, directly or indirectly, by a large number of persons.

These definitions are obviously vague. The excuse is, that the ideas which they express are vague. If we were to define the aristocratic principle as the influence of a minority, the democratic principle as the influence of a majority of the people, almost all the institutions which are usually called democratic must be called aristocratic. The only legal share in the government of France possessed by the people, consists in their right to elect the Chamber of Deputies. This is always held to be the democratic portion of the French constitution. But out of the thirty-four million inhabitants of France, not more than one hundred thousand are electors. Without doubt, the democratic element would be increased if the franchise were extended. But that the difference between the aristocratic and democratic principles consists rather in the positive number of the persons admitted to power, than in the proportional num-

bers of those admitted and excluded, will become evident; if we consider what would be the effect if the inhabitants of France were diminished, but the proportions of electors and non-electors preserved. If France contained only three hundred and forty thousand persons, of whom one thousand elected a legislative body, the institution would be aristocratic. On the other hand, if the British House of Commons were elected by the householders of the metropolis, it would still be a democratic, not an aristocratic institution, although the metropolitan householders constitute a small minority of the inhabitants of the British islands. The Ecclesia of Athens was a democratic assembly, though out of the four hundred thousand inhabitants of Attica, not twenty-five thousand had a right to vote. So far as the conduct of a body depends on their number, it must depend on their positive number, not on the proportion which that number bears to the number of some other class of persons. If that number be very large, it is subject to the contagion with which fear and hope, love and hatred—in short, all the passions—are propagated from mind to mind, and exaggerated as they are diffused. It is more generous and more cruel—more sanguine and more desponding—more rash and more easily frightened—more ready to undertake and more ready to abandon what it has undertaken—more confiding and more suspicious—more prone to erect idols and more prone to break them—than would be the case with the individuals composing it, if they had to feel, and to think, and to act separately. It is likely, as its number increases, to contain a larger proportion of ignorant, violent, and uncultivated persons. It is likely, in short, to possess the qualities—some noble, but most of them dangerous, hateful, or contemptible—which belong to a mob. On the other hand, in proportion as the number is small, it is likely to be cool, selfish, and unimpassioned; to allow its perseverance to run into obstinacy, and its caution into timidity; to be tenacious of old impressions and unsusceptible of new ones; to be steady in its sympathies and in its antipathies; to be sparing of reward and unrelenting in punishment; to be permanently grateful and permanently unforgetting; to be marked, in short, by the austere, respectable, but somewhat unattractive character which we associate with the name of a senate.

We have followed Lord Brougham in applying the term "aristocratic" to the legislative influence of a small number of persons; but we should have preferred, if usage had permitted it, the term "oligarchical." The word "oligarchy" is univocal, and is associated with no idea except that which it expresses. The word "aristocracy" is often used to express mere excellence, without any reference to power—as when we talk of the aristocracy of talent or the aristocracy of learning. Derivatively, it means either the government of the best numbers of the society, or, according to Aristotle,* a government *πρὸς τὸ ἄριστον τῆ πόλις*—a government which endeavors to promote the welfare of the community, or the objects in the attainment of which the community thinks that its welfare consists. It has almost every defect, therefore, which an appellative can have. It is equivocal, it is associated with an extraneous idea, and its derivative meaning differs from both its received meanings. Its use, however, to express government by a few, is so established, that we think it, on the whole, best to retain it.

* *Pol.*, lib. iii. cap. vii.

In the remainder of the first volume, Lord Brougham treats of pure or absolute monarchy—that is, of the form of government in which there is no legal restraint whatever on the will of the reigning individual. He divides pure monarchy into Oriental or despotic, and European or constitutional. In each, the monarch is absolute—in neither is there any direct legal check to his will; in each, therefore, the checks are indirect, but in the former the only indirect checks are religious opinions, and the fear of resistance; in the latter, to these checks are added habits and feelings among the people, the results of a former prevalence of the aristocratic or democratic principle, now obsolete or abolished, and institutions which the monarch, though he has legally the power to destroy them, does not venture actually to destroy.

We doubt the convenience of this distinction. It is a distinction founded on the nature, not of the forms of government in question, but of the people who are subject to them. It is like the distinction drawn by Aristotle between *βασιλεια* and *τυραννις*—the former being the absolute rule of one for the good of all, the latter, the absolute rule of one for his own benefit. Under the Antonines, as well as under Commodus, the Roman constitution was expressed by the maxim, *Quod principi placuit legis habet vigorem*; so, in Denmark as well as in Turkey, the will of the reigning individual cannot be legally opposed. The accidental circumstances, that the personal character of the monarch induced the Antonines to exercise their will beneficially, and Commodus to exercise his will mischievously, and that the character of the people, and the situation of the country, lead the despot, whatever be his personal character, to act very differently in Turkey and in Denmark, have nothing to do with the question, What is the form of government?

We think that the best mode of treating the subject would have been to consider pure monarchy, whether European or Oriental, as the same form of government, modified in its effects by the character of the people over whom it is exercised.

Lord Brougham's statement of the effects of absolute monarchy, when the state of society is favorable to their unmitigated development, is, as might be expected, eloquent and full. He describes the people as brutalized by fear, the despot by dominion, and all improvement as arrested by the jealousy of power. He inquires, whether pure monarchy have any redeeming qualities, and, with the single exception of a promptitude of decision and action, denies that it has any. But these he treats as doubtful merits, generally balanced by evils of the same kind with the advantages; promptitude of decision being often precipitate, and promptitude of action being impaired by want of means, occasioned partly by the deteriorating effects of despotism, and partly by its inability to call forth rapidly and fully the resources, such as they are, of its subjects. He does not exempt from his censure the influence of despotism even on the foreign concerns of a nation—its intercourse with other states, its treaties and alliances, on the maintenance of peace, or the prosecution of war. "To go no further," he says, "than the tendency of such governments towards war at all times, if in every other respect they were faultless, this would be their condemnation. War is emphatically the game of kings, and they will always love it, and, if absolute, will never cease to play at it, until the exhausted resources of their states, the

fear of revolt, or the danger of being conquered, force them into quiet."—(Vol. i., p. 151.)

That the monarchs who govern barbarous nations are prone to war, is true; and so are the rulers, and indeed the people in barbarous nations, whatever be the form of government. Uncivilized man is a beast of prey. The early history of every nation, democratic, aristocratic, or monarchical, is perpetual war. But when Lord Brougham attributes a peculiar tendency towards war to the monarchical principle—when he maintains that when a single individual has to decide on peace or war, he is more likely than an aristocratic body or a popular assembly to decide for war—we dissent from him.

What are the results of experience? Are the modern European nations pacific in proportion to their freedom? Is the peace of the world more endangered by Austria or by Prussia, than by France or by England? Have democratic institutions produced peace in America?

The motives to war are two—ambition and vanity. The one shows itself in the desire of an extension of territory or of influence; the other in the desire to acquire glory or avenge insult. The English people are free from ambition; perhaps they are the only great people that ever has been so. An English writer naturally associates the unambitious with the popular character of the government, and supposes that the former quality is the result of the latter. But the government of France is as democratic as that of England, perhaps more so, and yet she is absolutely mad with ambition. Nor is this peculiar to the present time. In proportion as the people of France have been able to influence their government, they have forced it on wars of conquest. The unprovoked conquest of Savoy was one of the first acts of the convention; it was immediately followed by the incorporation of Belgium and the subjection of Holland. The conquests of Napoleon seduced the French to endure his oppressions, and make them now idolize his memory. The pacific policy of the restoration was the great obstacle to its popularity. In the hope of pleasing the people, the government perpetrated the wanton invasion of Spain, and the experiment was successful. No sooner did the Revolution of 1830, lead the people to believe their influence supreme, than they demanded war and conquest, the boundary of the Rhine and the retention of Algiers. Even within the last year, the government obtained some popularity by engaging in the war with Morocco, and lost it again by dictating a triumphant but reasonable peace. That France is not now at open war in any part of the globe except Africa—that in Europe she is incurring only that portion of the evils of war which consists in the waste of the national resources on fortifications, armies, and fleets, and the discouragement of industry and commerce by the doubtfulness of the future—is altogether owing to the prevalence in her councils of the monarchical over the democratic principle.

If there be any portion of the world in which the desire of conquest is peculiarly irrational, it is America, where a population not greatly exceeding that of France is scattered over a country more than four times as large as Europe; and yet, throughout that hemisphere, ambition has been the curse of every state in which the influence of the people has become dominant. The democracy of the United States bullied Spain out of Louisiana, bullied Mexico out of Texas, rose *en masse* along

their northern frontier in the hope of seizing the Canadas, and is now ready for war, in the hope of appropriating the Oregon country, two thousand miles from their own back settlements. As for the southern republics, no sooner had they freed themselves from the monarchical influence of Spain and Portugal, than they began to fight with one another for frontiers; and that in a country where the great evils are the paucity of people and the extent of territory.

If popular governments are prone to wars of ambition, still more are they to those of vanity. Let any practical diplomatist say, whether it be easier to induce a minister who represents the will of an absolute monarch, or one who depends on the majority of a popular assembly, to repair or even to confess a wrong, or to accept equitable terms of satisfaction or compromise. The reasons for this are numerous, and, we fear, not likely to be removed or even weakened. In the first place, the secrecy which covers the negotiations between monarchs saves their vanity. A concession is easily made where its only real evil depends on its publicity, and that publicity can be prevented. A victory is of little value when it is recorded only in the archives of a state-paper office. A popular government lives in the face of day, and has to apologize to its own subjects for every act of prudence or of justice. In the second place, an individual can generally be forced to hear both sides of the question. There are few disputes in which each party is not in some degree in the wrong, or in which he can avoid perceiving that he is so; if once he be compelled to give a deliberate attention to all his opponent's arguments. The instant that this discovery has been mutually made, if there be no *mala fides*—that is to say, if the controversy arise not from ambition but from vanity, if it be the cause of quarrel, not its mere pretext—an accommodation is almost inevitable. A nation does not listen to reason. It cannot be forced to study both sides of a question, and never does so voluntarily. It reads only its own state-papers, its own newspapers, and its own pamphlets; it hears only its own speakers, it accepts all their statements of facts and of law; and holding itself to be obviously and notoriously right on every point, believes that it would be dishonored in the face of all Europe by the slightest concession. Again, every popular government is infested by faction. It always contains one party, sometimes more than one, whose great, and sometimes whose principal object is the subversion of the existing ministry. The foreign policy of a ministry is generally its most vulnerable point. It is the subject about which the mass of the people always understand least, and sometimes feel most. If a minister be bold, the opposition halloo him on to make extravagant demands, in the hope that he may be entangled by war or disgraced by retreat; if he be prudent, they accuse him of sacrificing the interests or the honor of the country, of surrendering to foreign ambition, or quailing before foreign insolence. And lastly, there is in every nation in which the democratic element prevails, an important power whose immediate interests are opposed to peace, external as well as internal, and that is the daily press. A newspaper lives on events. It lives by taking of those events the view that agrees best with the passions and prejudices of the people. It pleases them best by stimulating their pride, their vanity, their resentment, and their antipathies. It is the demagogue of a nation of readers; and, like other

demagogues, is generally popular in proportion to the violence and the mischievousness of its counsels.

It is true that an undue tendency to war, or at least an insufficient dread of its evils, is frequent in every government—whether the monarchical, the aristocratic, or the democratic principle prevail; but so far from believing that this defect belongs peculiarly to monarchical government, we believe that form of government to be, on the whole, less subject to it than any other, except perhaps a pure aristocracy.

We now proceed to consider the other of the two branches with which Lord Brougham has subdivided pure monarchies, namely, the monarchies which he terms constitutional—those in which the authority of the sovereign, though legally unfettered, is moderated by popular habits or feelings, the relics of lost privileges, or by institutions which he cannot venture to abolish. Of these institutions the most important is an hereditary nobility. Lord Brougham treats it as the test which distinguishes constitutional monarchy from pure despotism.

We extract from Lord Brougham's statement of the effects peculiar to this form of government, the small portion for which we have room—

“A monarchy is naturally extravagant—it is splendid and it is expensive—it is reckless of the general suffering from the burdens of taxation; and it is prone to consider only the interests and enjoyments of courts and persons in authority. A richly endowed hierarchy—numerous governments of towns and provinces—a large military staff—in maritime countries expensive colonies—must all be kept up to provide for the nobles and their families, and their followers.

“The maintenance of a standing army, numerous, expensive, and well disciplined, is another charge upon all monarchies. Large armies are incompatible with the genius, almost with the existence, of a commonwealth. With the institutions of a pure monarchy they square perfectly—they are in complete harmony with its spirit.

“The whole arrangements of the state are modelled upon the monarchical footing. In a country where the public are wholly excluded from the administration of state affairs, they cannot safely be admitted to manage even their own local interests, because the habit of acting in these would inevitably beget the desire to interfere in the affairs of the community at large.

“The influence of the monarchical principle, but especially when combined with aristocracy, as in European monarchies it ever must be, tends to the establishment of a division of property, not very wholesome for public liberty, or for the character of the people, though attended with some redeeming consequences: we allude to the rule of primogeniture. The law of entails is the abuse of the law of primogeniture; and their consequences are prejudicial to the happiness of families, as well as to the wealth and commerce of the country.

“The will of the court and upper classes becomes the law, and their habits the example for all. Court favor and the countenance of nobles are the objects of universal pursuit. No spirit of free speech or free action can be said anywhere to exist. Among the upper classes, those who are brought into immediate contact with power, fear prevails almost as much as in pure despotisms. The alarms, the suspicions, the precau-

tions, prevalent in the society of the superior classes in Italy and Germany, are almost equal to any which can be observed in the courts of the East.

“The vigor of the monarchical government, both at home and abroad, is the quality most boasted of by its admirers; and to this it can lay claim from the unity of its councils, and the undivided force which it brings to their execution. But there is one virtue which this constitution and all monarchy possesses beyond any other—the fixed order of succession by inheritance. In this respect it excels both despotisms and commonwealths. The former are constantly subject to revolution and violence; the latter are unstable from opposite causes; but monarchies, established by law and accompanied with regular institutions, have the hereditary principle of succession in perfection. That this rule leads to great occasional mischiefs, there can be no doubt. Nevertheless, the dangers which are sure to result from suffering the place of chief magistrate to be played for by intriguing, or fought for by ambitious men, are so formidable as to make reflecting persons overlook all lesser risks in the apprehension of the worst of calamities, civil war. This is the redeeming quality of monarchy; it is far enough from leaving the question all one way, but upon the balance it gives a great gain.”—(Vol. i., p. 357 to 363.)

We have already remarked that pure democracy is impossible in any country larger than an ordinary English parish; and there is no case in Europe, modern or ancient, in which any nation on the scale of the great European monarchies, has adopted enough either of the aristocratic or of the democratic principle, to entitle its form of a government to be described as an aristocracy or as a democracy, and has retained that form for a period sufficient to enable us to estimate its permanent effects. The modern American States, indeed, are essentially democratic; but the situation of the United States, without a formidable neighbor, is too peculiar; and the independence of the others is too recent, to allow them to be used as fair objects of comparison. It is impossible, therefore, to infer from actual experiences, whether, if thirty, or twenty, or ten millions of persons constituted one nation, with a government essentially aristocratic or essentially democratic, and surrounded by other powerful states, that government would have a less tendency to extravagance, to the maintenance of large standing armies, to centralization, or to primogeniture, than is now the case with Austria or Prussia. As direct proof is unattainable, we will inquire into the results, on each point, of analogical reasoning.

First, as to extravagance. The mixed governments of Europe, those which are distinguished from its absolute monarchies by a strong infusion of the aristocratic or democratic principle, are in general also distinguished by their greater public expenditure. The expenses of the Danish, the Prussian, or even the Austrian court, are insignificant, compared with those of the courts of England or France; or indeed, if the extent of territory and population be compared, of Holland. The amount of the annual taxation compared with the population, is more than three times as great in each of the three mixed governments, as it is in any of the three absolute governments. There is, indeed, one great source of expense in mixed governments, from which absolute governments are comparatively free—the creation of offices for the sake

of patronage. An absolute monarch can give money, and that is always the cheapest way of rewarding or buying. In a mixed government, a place is created or retained, duties are attached to it—generally useless, often mischievous; still, as they are troublesome, they must be remunerated, and a claimant who would have been satisfied with £100 a-year as a pension, must have £300 on the condition of residence and employment. It is thus that England retains its three hundred Ecclesiastical Courts. Every one admits that two hundred and ninety-nine of them are instruments for the creation of trouble, delay, and expense. An absolute government would sweep them away by a decree of ten lines. Every year the mixed government of England attacks them, and is repulsed.

Second, the amount of the standing army of a nation seems to depend little on the form of its government. The largest in proportion to its population is that of Holland; the next is that of France; the smallest is that of China. When Spain and Portugal were absolute monarchies, their standing armies were trifling, and so are those of most of the Italian monarchies. Ireland, with eight millions of people, requires a standing army more than twice as large as is necessary in Great Britain, with a population of above twenty-one millions.

Third, again, with respect to centralization. France, under a mixed government, is incomparably more centralized than she was under an absolute monarch. The local administration of Spain under her absolute kings was almost democratic. So was that of Norway, when she formed part of the absolute monarchy of Denmark: so is that of India, though she has been ruled by absolute monarchs for twenty-five centuries. An Indian village scarcely knows the existence of its monarch except through his revenue-officers. The fortunes and lives of the inhabitants are at his mercy; but while his taxes are paid, he abstains from all interference. The tendency of the British government is at once towards democracy and centralization; and every advance towards the former is generally accompanied by a much greater advance towards the latter. So far from believing that the exclusion of the people from political power is likely to exclude them from the management of their local interests, we are inclined to think that an absolute government, partly to avoid trouble, partly to avoid expense, and still more from carelessness, is more likely than any other to abandon to the parishioners what it considers the trifling matters of the parish.

Fourth, primogeniture is natural only in a peculiar state of society, that in which the possession of land gives political power, proportioned in some measure to its extent or value; and even then seldom exists except among the owners of land. It is essentially an aristocratic custom. In Oriental despotisms, therefore, where the land is generally the property of the sovereign, it is unknown. It is rare in the United States of America, except in the Southern States, where a proprietor can vote for his slaves. It is rare in the British islands, excepting among the high landed aristocracy. No man with a fortune consisting of £90,000 in the funds, or even of a landed estate worth only £20,000, thinks of making an eldest son. Even if it were lawful in France, it probably would be uncommon. The aristocratic element is so weak in France, that the slight amount of political power

which a man could secure to his son by leaving to him his whole property, would seldom be sufficient to conquer his natural feelings of parental justice. The prevalence of primogeniture in the absolute European monarchies, arises from the former prevalence among them all of the aristocratic element. The monarchs have always endeavored to restrain it. In England, perpetual entails were abolished by the Tudors, the race under whom the monarchical element was strongest. In Scotland, where the aristocratic element has always been more powerful than in any other part of the British islands, a larger proportion of the land is subject to perpetual primogeniture than in any country in Europe, except perhaps some parts of Germany.

We cannot think, therefore, that either extravagance, standing armies, centralization, or primogeniture, flow naturally from the monarchical principle. And we must add, that even if we thought monarchy peculiarly favorable to these three latter institutions, we should not treat that tendency as necessarily a vice. Standing armies, indeed, may be too large, and centralization may be excessive; and such is generally the case on the continent of Europe. But they each may be deficient. The standing army of America is insufficient to keep her at peace at home or abroad, to prevent her inhabitants from injuring one another, or from attacking her neighbors. The local authorities of England are the seats of ignorance, selfishness, jobbing, corruption, and often of oppression. Every diminution of their power has been an improvement; and, if we had room, we could show that the case is the same as to primogeniture. Both the power to entail, and the wish to exercise it, may certainly be excessive, as we think they both are in Scotland and in Germany; but both or either of them may be deficient, as we think they both are in France and in Hindostan.

We agree with Lord Brougham that the influence of absolute monarchy, even when tempered by European civilization, is unfavorable to the character of its subjects. We agree with him that it is destructive of free action, and, to a certain degree, of free speech, and that it impairs most of the manly and independent virtues. But we do not believe that "the alarms, the suspicions, and the precautions prevalent in the society of the superior classes in Italy and Germany, are almost equal to any which can be observed in the courts of the East." That where every man of eminence is conscious that he hates the existing government, and is anxious to subvert it, he should be always on his guard against betraying his feelings and his wishes to the distributors of punishment and favor—and that the government itself, knowing that all the ground beneath it is mined, should be always on the watch for an explosion—all this is inevitable in countries which have been recently the scenes of revolutionary movement; and where the sovereign owes his power to conquest, or to foreign support, or to promises treacherously evaded or shamelessly broken. But this state of mutual alarm, suspicion, and precaution, is not a necessary incident to the absolute European monarchies. It does not exist in Prussia, or in Denmark, or in the German provinces of Austria, or, in fact, in any portion of Europe, except parts of Russia, Poland, and Italy. On political subjects, without doubt, there is less freedom of speech in Vienna or

in Berlin than in Edinburgh or in London; but there are other subjects on which there is much more; and we believe that it would be safer to talk Chartism in Naples than Abolition in New Orleans.

We fear that we shall be thought paradoxical if we suggest some doubts as to the superiority which Lord Brougham ascribes to the principle of succession, over that of election, in absolute monarchies. In limited monarchies, where the king reigns but does not govern—where he has only to accept the ministers who can obtain a parliamentary majority, to sign whatever they lay before him, and to receive their resignations when they find it necessary to retire—there is scarcely any drawback to the advantages of hereditary succession. The sovereign's great office is to be a keystone, merely to fill space—to occupy the supreme station, in order to keep others out of it. He may be—perhaps it is better that he should be—the person in his kingdom who knows least, and cares least, about politics. His personal character is comparatively unimportant. We say comparatively; because, even in the most limited monarchy, the social influence of the sovereign for good or for evil is considerable. His habits and tastes are always matters of notoriety, and often of imitation. Access to his society is always coveted. He may give that access in a manner useful, or mischievous, or absolutely indifferent. He may call to his court those who are most distinguished by genius or by knowledge; or those whose only merit is their birth or their station; or parasites, buffoons, or profligates. Even in the appointment of ministers, he may sometimes exercise a sort of selection. He is sometimes able to delay for a short period the fall of those whom he likes, and the accession of those whom he dislikes; and he can sometimes permanently exclude an individual. But even these powers he can seldom exercise unless in a state of balanced parties. If one party have a decided ascendancy in the legislative assemblies, and in the constituencies, the limited sovereign is little more than a phantom; and there can be no doubt that it is better that a phantom should be hereditary. An absolute king always is, or ought to be, a substance. Supposing such a monarch to covet the leisure, the quiet, and the irresponsibility of a limited king—to desire that the fittest persons should be his ministers, and manage public affairs without his interference—how is he to discover who are the fittest persons? How is he to avoid appointing or retaining persons positively unfit? He has no parliament to direct his choice—no opposition to expose the errors of those whom he has chosen; he cannot mix in society, and hear the independent voice of public opinion. Even the press gives him little assistance: first, because a free press probably cannot exist—certainly never does exist—in an absolute monarchy; and secondly, because the press is never a well-informed, an impartial, or even an incorrupt adviser. A king governed by newspapers would resemble a judge who should allow himself to be influenced by anonymous letters. There is one mode, and only one mode, by which he can satisfy himself that his ministers are fit for their office; and that is, by giving up his scheme of non-interference, and performing himself a great part of their functions. Every absolute king who is an honest man, must be in constant communication with the heads of every department—he must take part in

every council—he must exercise his own judgment on every important measure—he must, in short, be the chief of his own cabinet. But if the exercise of the art of government—the most important, the most complicated, and the most difficult of arts—the art which requires most knowledge, most intellect, and most virtue—is advisedly to be thrown upon a person appointed by accident, and, as Lord Brougham has well remarked, probably rendered by education even less fit than he was by nature, some vast advantage must counterbalance these enormous evils.

Lord Brougham finds this advantage in a diminution of the chances of civil war. But does this advantage really exist? If Europe possessed a universal, a well-known, and an unalterable law of hereditary royal succession, and if the facts calling that law into operation were always certain and always notorious, so that, on the decease of a king, there never could be a doubt as to his legitimate successor, we should have, what Lord Brougham terms, “the hereditary principle of succession in perfection.” But it is obvious that such a law does not exist, and cannot exist. In some absolute monarchies, the law of succession excludes females—in others it excludes foreigners—in all it excludes bastards—and in all it necessarily can be altered by the reigning monarch. If the Salic be the existing law, and the monarch has only daughters, he abolishes it, like Ferdinand VII. of Spain. If it admit females, and the reigning monarch wishes to exclude them, he abolishes it, and introduces the Salic law, like Philip V. of Spain. In each case a civil war is probable. If he have no issue, he adopts—if his issue be illegitimate, he legitimizes it. Even if it be legitimate, its legitimacy may be contested, and the peace of the kingdom may depend on a mixed question of law and fact, in which every element of the decision may be doubtful. The children of kings generally make royal marriages, and the party who ascends, or becomes likely to ascend a foreign throne, is generally required, before he leaves his own country, to renounce all claims to its succession. Is such a renunciation binding on the renouncing party? Is it binding on his issue? Those who might claim if there had been no renunciation, always maintain that it is not—those who claim against it, that it is; and the consequence is, as in the case of the Spanish succession after Charles II., a complication of foreign and civil war. Again, most monarchies are composite, and the different parts are subject to different laws of succession. Females succeed in Jutland, and are excluded in Holstein. If the prince-royal of Denmark should die, as will probably be the case, without male issue, will the kingdom of Denmark be dismembered? If kept entire, will it be at the expense of civil war? Or will the result be an unopposed usurpation, like the retention of Sardinia and Montserrat, both female fiefs, by the present king of Piedmont, in disregard of the claims of his predecessor's daughter? If we compare the wars of succession, foreign and civil, which have laid waste Europe, between the Norman Conquest and the French Revolution, it will be found that they exceed all other wars put together in number, and still more in duration. A war of succession is the most lasting of wars. The hereditary principle keeps it in perpetual life—a war of election is always short, and never revives.

On the whole, if it were possible to keep an

absolute monarchy elective, we should hold that form of government, bad as it is, to be more conducive to the welfare of the people than an absolute hereditary monarchy. It secures the object of monarchy—the management of public affairs by one strong will and one sagacious intellect. No English monarch equalled Cromwell or William III.—no French monarch Napoleon or Louis Philippe. Absolute hereditary monarchy secures nothing—not even, as we have seen, undisputed succession. But, excepting in one peculiar case, no absolute monarchy can remain elective. The monarch has, by supposition, the power to render his throne hereditary; for, if he have not that power, he is not absolute. If he have it he will exercise it. Even Marcus Antoninus delivered the whole civilized world to Commodus. The difficulty was long ago stated by Aristotle—“It has been supposed,” he says, “that a king having the power to make his son his successor, may not exercise it. But this cannot be believed. It would be an act of virtue of which human nature is incapable.”—(*Pol.*, lib. iii. cap. xv.)

The exception to which we have referred, is that of the Roman Catholic ecclesiastical monarchies. Of these monarchies, so numerous until the end of the last century, we believe that the Papacy alone remains. It is the only one which Lord Brougham has thought worthy of his attention; and yet the others deserve to be mentioned, on account at least of their number and their durability. In Germany alone there were seventy up to the close of the last century. Many were considerable—three were Electorates. In many of them the succession of archbishops or bishops, or abbots, or abbeesses—for in several of them the ruler was a nun—lasted for more than one thousand years, uninterrupted by foreign violence or by revolution. And yet nothing could be more absurd than the system of election. A man qualified himself for the exercise of the highest legislative and executive functions by renouncing the world, by studies which have no connexion with its affairs, by unacquaintance with men and with things. The electoral body consisted in general of persons similarly educated, and so did all the executive functionaries; so that unfitness seemed to be the qualification for office.

These strange governments, however, were not unpopular. It was thought good to live under the crossier. They were regretted while those who had experienced them lived. The elective sovereign must in general have been a man of some distinction. He had not been spoiled by the early possession or the early prospect of power, and he was often anxious to dignify, by some acts of permanent utility, a dynasty which began and ended with himself.

Omitting, for the reasons already given, the remainder of the first volume as historical, we proceed to the second, which treats of aristocracy.

Lord Brougham defines aristocracy to be the form of government “in which the supreme power is in the hands of a portion of the community, and that portion is so constituted, that the rest of the people cannot gain admittance, or can gain admittance only with the consent of the select body.”—(*Vol. ii.*, p. 1.) He does not lay down any ratio of the governing, to the excluded portion of the community, as essential; and as he admits that the exclusion of the Roman Catholics, by the penal laws, did not render the government of Ireland an aristocracy, and that the exclusion

of slaves did not render Athens, and does not render Virginia aristocratic, it follows, that he does not consider a government an aristocracy, although the supreme power is in the hands of a minority *relatively* small, if the number of persons constituting that minority be *positively* great. But it must be admitted that the words of Lord Brougham's definition are more extensive; and so are the words of every definition of aristocracy that we have seen. We believe that the best corrective of the established nomenclature would be to introduce a cross division, and to divide governments not only into monarchical, aristocratic, and democratic, with reference to the possession of power by one, by few, or by many; but also into *exclusive* and *non-exclusive*, with reference to the admission to power, or exclusion from it, of particular classes. Pure monarchies are, in one sense, the most exclusive, since all power is concentrated in the prince. In another sense they are the least so, since he can delegate, or even transfer it, as he pleases. All other forms are more or less exclusive. Wherever slavery prevails, slaves are excluded. With a very few exceptions, one of which occurs in an Anglo-American state, women are always excluded. In most governments, persons bound by a foreign allegiance are excluded, though there is now an example in Europe of a person who is a king in one country and a peer in another—who exercises in one, supreme legislative and executive authority, and in the other, can merely vote and protest. In many countries, all who do not profess a particular form of religion are excluded; in many, all who do not belong to a certain race; in still more, all who do not possess a certain amount of property or income. The representative institutions of France are democratic, but highly exclusive. They are democratic, because they give political power to a very large number of persons. They are exclusive, because they deny that power to a much larger number. The English house of lords is an aristocratic institution—it gives power to a small number of persons. It is very slightly exclusive, since it is open to all males professing Christianity, and born in the British allegiance.

The most convenient definition of a pure aristocracy then is, the form of government in which the whole legislative power is vested in a small number of persons, without any legal control by the people at large, or by any individual. Such aristocracies are, as Lord Brougham remarks, rare; but as the aristocratic element is widely diffused, it is an important subject of investigation; and the best mode is that which he has adopted, namely, to ascertain the qualities of a pure aristocracy, and thence to infer the influence of the aristocratic element in mixed governments. The vices ascribed by Lord Brougham to aristocracy are, that it places the government in the hands of persons, 1. irresponsible; 2. uninfluenced by public opinion; 3. affected by interests differing from those of the community at large; and, 4. peculiarly unfitted by education for exercising the high functions of their station.

"The training," he says, "of patricians, next to princes, is peculiarly adapted to spoil them. They are born to power and preëminence, and they know that, do what they will, they must ever continue to retain it. They see no superiors; their only intercourse is with rivals, or associates, or adherents, and other inferiors. They are pampered by the gifts of fortune in various other

shapes. Their industry is confined to the occupations which give play to the bad passions. Intrigue, violence, malignity, revenge, are engendered in the wealthier members of the body and the chiefs of parties. Insolence towards the people, with subserviency to their wealthier brethren, are engendered in the needy—too proud to work, not too proud to beg; mean enough to be the instruments of other men's misdeeds, base enough to add their own."—(Vol. ii., p. 55.)

He adds, that it is the tendency of aristocracy to produce among the people a general dissoluteness of manners, eagerness in the pursuit of wealth, and extravagance in its employment; and "not only to vex and harass, but to enslave men's minds. They become possessed with exaggerated notions of the importance of the upper classes; they bow to their authority as individuals, not merely as members of the ruling body—transferring the allegiance which the order justly claims, as ruler, to the individuals of whom it is composed; they ape their manners, and affect their society. Hence an end to all independent, manly conduct."—(Vol. ii., p. 57.)

We regret that the necessity of curtailment has prevented our inserting more of this passage. Much of the great vigor and vividness of the original depends on its developments and illustrations. But we have extracted enough to show its great merit rhetorically as well as philosophically; and it has the additional value of being testimony. The author belongs to the class which he describes—he paints those with whom he lives. But if we examine the picture in detail, it will be found that many of its features belong not to the institution itself, but to the forms which it has most usually assumed, particularly in modern times: or to other institutions with which it is only occasionally and accidentally connected. Thus the distinctness of the interests of the ruling body from those of the community at large, belongs to all governments in proportion, not as they are aristocratic or democratic, but as they are exclusive. It was its exclusive, not its aristocratic character, which occasioned the Protestant government of Ireland to be mischievous. So the slave legislation of the Southern Anglo-American States—perhaps the legislation by which the interests of the great majority of the inhabitants of any country have been most cruelly and most shamelessly sacrificed—is the legislation of a government eminently democratic. So Lord Brougham treats as aristocratic the unjust advantages given by British legislation to landowners; but they arise from the exclusive, not from the aristocratic elements in the British constitution—not from power being in the hands of a few, but from almost all who do not possess land being excluded from it.

If we suppose the supreme power to reside in a senate sitting only for life, but itself, as was the case with most of the ancient senates, filling up its vacancies—such an institution would be aristocratic; but, as it would not be necessarily exclusive, it would not necessarily be governed by interests distinct from those of the community at large. Nor would "the education of the rulers be such as peculiarly to unfit them for worthily exercising the high functions of their station." This was not true of the Roman senate. It is not true of any aristocracy which is not hereditary. Nor would the tendency of such an aristocracy necessarily be to promote general dissoluteness of manners, self-indulgence, and extravagance; or,

on the other hand, rapacity. Indeed, the opposed, but not inconsistent, vices of prodigality and rapacity, seem to belong more to democratic governments, in which wealth is the great source of distinction. No community is so stained by them as Anglo-America. And lastly, as it appears that "insolence, selfishness, and luxurious indulgence" do not necessarily belong to an aristocracy, it is not necessarily subject to the odium which, according to Lord Brougham, (p. 56,) these vices inflict on it.

In fact, nearly all these censures affect not aristocracy but a privileged order—an institution which may exist under any form of government except a pure democracy, and need not possess power legislative or even executive. The noblesse of France, while her monarchs were absolute, had all the qualities which Lord Brougham has described as patrician. It was ill-educated, selfish, and luxurious, born to preëminence, insolent to its inferiors and submissive to its master, and became to its fellow-countrymen an object of admiration and of imitation; but at the same time, of hatred so intense, that the main purpose of French legislation for the last fifty years has been to prevent its reëstablishment. But though such an order could not have existed unless it had once possessed political power, yet at the time of which we are speaking that power was gone. All that remained were some traditional rights, which as soon as they were attempted to be employed melted away. Its immunity from taxation, its social distinctions, its monopoly of the higher military, diplomatic, and household offices, its pensions and its ribands, it owed merely to custom, and to the will of an absolute master that the custom should continue. It was not an aristocracy, or even an aristocratic institution. On the other hand, the French Chamber of Peers is an aristocratic institution. It is a small body of persons possessing a portion of the supreme legislative power. But of the six aristocratic defects enumerated by Lord Brougham, only the first, the absence of individual responsibility, belongs to it.

Lord Brougham now proceeds to inquire whether the aristocratic institution possesses any virtues to be set in opposition to so many imperfections.

"There cannot," he says, "be any doubt that the quality of firmness and steadiness of purpose belongs peculiarly to an aristocracy. The very vices which we have been considering lead naturally to this virtue, and it is a very great merit in any system of government. A system of administration, a plan of finance, a measure of commercial or agricultural legislation, a project of criminal or other judicial administration, may seem to have failed, yet the patrician body will give it a further trial. They adopted it on mature deliberation, and not on the spur of a passing occasion; they will not be hastily driven from it. Akin to this merit is the slowness with which such a government is induced to adopt any great change. Indeed, resistance to change is peculiarly the characteristic of an aristocracy; and the members of the ruling body and their adherents obtain at all periods, in a greater or less degree, the power of stemming the revolutionary tide. This makes them equally resist improvements; but it tends to steady and poise the political machine. The history of our own House of Lords abounds in examples of these truths. But for their determination to resist measures which they deemed detrimental to the state, or to which they had objec-

tions from a regard for the interests of their own order, many measures of crude and hasty legislation would have passed in almost every parliament."—(Vol. ii., pp. 57, 58.)

To these merits of aristocracy he adds that it is pacific, partly from dislike of change, partly from military unfitness, partly from jealousy of military eminence, and partly from the want of individual ambition; that it encourages genius in arts and in letters; that it excites and preserves the spirit of personal honor; and that it is favorable to order and subordination.

To a certain degree it appears to us that Lord Brougham again attributes to aristocracy, as a form of government, effects—such as a high sense of honor and refined taste—which are the results of the existence of a privileged order; an institution which, as we have already remarked, is as consistent with an absolute monarchy or a mixed government as with an aristocracy. An aristocratic government without a privileged order would not contain persons sufficient in number to affect materially the general tone of society. If its members sat only for life, they would carry into it the feelings of the classes from which they were taken. Nor do we agree with him as to the beneficial influences of aristocracy on the fine arts or on letters. The greatest works of the arts which address the eye belong to absolute monarchies, the next greatest to democracies. The Pharaohs built Thebes and the Pyramids, the Moguls Agra and Delhi, a Roman emperor the Coliseum, a Democracy the Pantheon. Of the Italian works of the fifteenth and sixteenth centuries, referred to by Lord Brougham, the greatest belong to the absolute monarchy of the Popes. The poorest period in English history, that which produced the fewest men eminent in arts or in letters, was the period during which the aristocratic element was predominant—the reigns of the first three Georges.

That an aristocratic government is pacific is true; it is pacific, not only from the reasons mentioned in the text, but also from its prudence and its want of passion. It is equally true that it is eminently firm, steady of purpose, and averse from change. These are the qualities which render the aristocratic element a necessary part of a well-framed government. It gives bone to the constitution. But in politics as in physiology, there is no disease more certainly fatal than ossification. Lord Brougham uses our house of lords as an example of the utility of a body in perpetual resistance to change. Admitting, as he fairly does, that it has frequently stood in the way of improvements, constitutional, economical, and administrative, he seems to think that great advantage has arisen from "its having had, during the last ten years, a preponderating share in the government of the country."—(Vol. ii., p. 59.)

That the house of lords has prevented much evil there is no doubt. But how much good has it prevented? How much evil has it prolonged? How much has it created? Without referring to the long period in which, under the domination of Lord Eldon, it steadily defeated almost every legal and administrative improvement, it is to the house of lords that we owe the present state of Ireland. Had it allowed the house of commons in 1825 to grant Catholic emancipation, and a provision for the Catholic clergy, the British islands would now have been morally as well as legally an united kingdom. One of the worst

effects of this hostility to change, is its tendency to produce the most complete of all changes—a revolution. With one remarkable exception, that of Venice, pure aristocracies have been the most short-lived of governments. They are barriers behind which abuses accumulate until the whole structure suddenly gives way.

It is remarkable that, in his statement of the virtues of aristocracy, Lord Brougham includes only its moral virtues. He gives it no credit for peculiar talent, knowledge, or skill. This may arise in part from his generally assuming it to be hereditary. But the members of even an hereditary aristocracy are likely to possess far more than average political knowledge. Politics constitute their profession; and we agree with Lord Brougham, that they are the only class among whom it is to be wished that the political profession should exist. The selected members of an aristocratic body—and there are many such bodies in which all, and very few in which none, are selected—are generally men of eminent talent. The most distinguished body in the United States is the Senate, in France the House of Peers, and, according to Lord Brougham, the British House of Lords possesses a general superiority “in capacity, in learning, in calmness, and in statesmanlike views of both foreign and domestic policy.”

—(Vol. iii., p. 65.)

To this must be added experience; not merely the personal experience of its members, most of whom have passed a political life, but the experience which belongs to the body itself. A legislative body which never dies, which is recruited by insensible additions and substitutions, acquires a traditional wisdom exceeding that of the individuals who compose it. The correct appreciation, too, which those individuals obtain of one another, gives the lead to those who are best fitted for it. A newly constituted assembly is likely to exhibit less, an ancient one to exhibit more, than the average intelligence and knowledge of its members.

We now proceed to the third of Lord Brougham's great divisions—democracy. He defines democracy to be, “the constitution which allows the superior power to reside in the whole number of citizens, having never parted with it to a prince, or vested it in the hands of a select body of the community, from which the rest are excluded.”—(Vol. iii., p. 2.) Inattention to the cross division of exclusive and non-exclusive, which, as we have remarked, runs through all forms of government, as it rendered Lord Brougham's definition of aristocracy too wide, renders this too narrow. It comprehends no exclusive form. Lord Brougham endeavors to meet this difficulty by considering democracies as less or more pure as they are more or less exclusive. But, for scientific purposes, though there may be degrees of impurity, there cannot be degrees of purity. Whatever is not perfectly pure is impure. If a definition of pure democracy be necessary, we think that the most convenient one would be—the government in which supreme legislative power is vested in a large number of persons, without any participation or any control on the part of any other body, or of any individual. But, as we have already said, such governments, if they have ever existed, are so rare, that we prefer considering, not democracies, but the democratic principle; which we have already defined to be the possession of legislative power, directly or indirectly, by a large

number of persons. Lord Brougham reaffirms that the constitution is not the less democratic, because the people legislate only through representatives. We must repeat our dissent. The delegation of legislative power is, *pro tanto*, a suspension of it. It substitutes, *pro tanto*, the will of a few for that of many. In proportion to the period of delegation, the opinions and wishes of the delegates, however complete may have been their coincidence, at the time of delegation, with those of their then constituents, are likely to deviate from those of their constituents for the time being. The first reformed house of commons represented the feelings and wishes of its existing constituents more completely, probably, than any previous, or indeed any subsequent, house. But, if it had been entitled to sit for fourteen years, would it now represent them? Delegation certainly does not destroy, but it weakens the democratic principle; and we consider all governments in which it prevails, as aristocratic or mixed. Aristocratic, if the delegating body be a small one, as was the case in Venice; mixed, if the delegating body, though perhaps itself a minority, be large, as is the case in France and in the American slave-states. Consistently with his own nomenclature, Lord Brougham has considered the subject of representation under the head of democracy. In pursuance of ours, we reserve it until we come to mixed governments.

Lord Brougham sums up the virtues of the purely democratic system under nine heads. Of these, five—namely, its tendency to render administration pure, to promote political discussion, to diminish civil expenditure, to render the resources of the state available for its defence, and to force individuals to respect public opinion—must be at once admitted. The remaining four we will briefly consider, using Lord Brougham's words, but somewhat changing his arrangement.

“1. The fundamental peculiarity,” says Lord Brougham, “by which this is distinguished from other forms of government is, that the people having the administration of their own concerns in their own hands, the great cause of misgovernment, the selfish interest of rulers, is wanting; and if the good of the community is sacrificed, it must be owing to incapacity, passion, or ignorance, and not to deliberate evil design. The sovereign in a monarchy pursues his own interest; the privileged body in an aristocracy that of their order, or of its individual members. No such detriment can arise in a purely popular government. At least the chances are exceedingly small, and the mischief can only arise from some party, or some individuals, obtaining so much favor with the people at large as to mislead them for their own ends; a thing of necessarily rare occurrence, because there will always be a conflict of parties, and the people are prone to suspicion of all powerful men.

“2. No risk is run of incapable or wicked men holding the supreme direction of affairs, either in the legislature or in an executive department. No infant in the cradle, no driveling idiot, no furious maniac, no corrupt or vicious profligate, can ever govern the state, and bring all authority into hatred or contempt.

“3. The course of legislation must always keep pace with the improvement of the age. The people always communicate to the laws the impression of their own opinions. No sinister interests can interfere to check the progress of improve-

ment. No prejudices of one class, no selfish views, have any weight.

"4. The personal ambition of an individual, his feelings of slighted dignity, his sense of personal honor, as well as his desire of aggrandizement, have no place under this scheme of polity. Had the virtuous Washington himself become enamored of military glory, and desired to extend the dominion of republican institutions over Canada or New Spain, the people would have speedily taught him that war is a game the people are too wise to let their rulers play."—(Vol. iii., p. 109—111—110.)

We have already stated our reasons for believing the democratic element to be far more favorable to war than either of the others. The reference made by Lord Brougham to the United States is unfortunate. They have already extended the dominion of republican institutions over a portion of New Spain; and if the popular will had been omnipotent, would have seized Canada. Nor can we agree with him in ascribing to democracy a peculiar exemption from legislation unjust or unenlightened; or from the domination of persons morally or intellectually unfit for power. Where the democratic element prevails in an exclusive constitution, laws are often made for the express purpose of oppressing the excluded classes. And when there is no legal exclusion, a democratic majority is often a grievous tyrant to the minority. In the southern states of the American Union, the slaves are oppressed; in the northern states, the rich; in all, the people of color. In the Swiss cantons, consisting partly of a town and partly of a rural district, the popular assembly, if the town interest prevail, tries to oppress the country; if the country interest, to oppress the town; and as the oppression of one portion of the community is always injurious to all, the good of the community is in fact "sacrificed to deliberate evil design." That Lord Brougham, with history open to him, and in fact having studied her pages diligently—with Athens and Rome representing the past, and Ireland and Canada the present—should gravely say that the chances are exceedingly small that some party or some individuals will be able for their own ends to mislead the people at large, is incomprehensible.

We admit that the people will always communicate to their legislators the impression of their own opinions; but for that very reason we do not believe that, where the democratic element is the strongest, and still less where it is the only one—and Lord Brougham is now speaking of pure democracies—the course of legislation will keep pace with the improvement of the age. In every country, there are a few individuals whose political wisdom far exceeds that of the mass of their fellow-countrymen. In a monarchy, or in an aristocracy, it is possible that they may guide or even constitute the government. In a democracy, it is not. The majority of every nation consists of rude, uneducated masses;—ignorant, intolerant, suspicious, unjust, and uncandid; without the sagacity which discovers what is right, or the intelligence which comprehends it when pointed out, or the morality which requires it to be done. Does any one believe that the public conduct of America, her ambition, her quarrelsomeness, or her dishonesty, reflect the intellectual and moral advance of the country? That advance is as great in America as in Europe. Their best men are equal to ours. The mass of the people is

superior to any European population. But the democratic element has become triumphant; and its influence has been shown by popular violence, by international litigiousness, by anti-commercial Tariffs, and by Repudiation. So far from there being, in a democracy, no risk of wicked men holding the supreme direction of affairs, we believe that it is a danger to which even absolute monarchy is hardly more exposed. How else has demagogue been a byword of reproach, from the times of Cleon to those of Marat?

Lord Brougham's enumeration of the vices of democracy is executed with great spirit; but as we generally agree with it, and as the substance had often been said before, though seldom so well, we will dwell on only one of its points. "There is one establishment," says Lord Brougham, "which appears incompatible with democracy, and that is a system of religious instruction endowed and patronized by law, with a preference given to it by the state over all other systems, and a preference given to its teachers over the teachers of all other forms of belief—in other words, a religious establishment.—(Vol. iii., p. 126.) He assigns as the grounds of this incompatibility, first, the reluctance of the dissenting portion of the community to contribute to the diffusion of what they believe to be religious error. And, secondly, that an establishment supposes a clerical order possessing great personal weight, endowed by the state, but unconnected with the government; and that the existence of such an order is wholly repugnant to democracy. To ascertain whether this be a virtue or a vice of democracy, he inquires into "the virtues and vices of religious establishments;" or rather compares their vices with those of the voluntary system.

He states the objections to an establishment to be three. First, that to be compelled to support a religion which a man conscientiously disapproves, is a serious grievance; secondly, that an establishment always gives to the government secular support, and becomes itself, therefore, subject to secular influences; and thirdly, that it tends to the restraint of freedom of speech and thought, to intolerant practices, and to the destruction of general improvement.

He then enumerates five objections to the voluntary system. First, that if the people were left to supply themselves with religious knowledge, many of them, and among these the classes which most require it, would often remain without it; secondly, that "if the people are to provide for the support of their own pastors, so must they select them also;" thirdly, that it promotes among the people the most dangerous of all excitements, religious excitement; fourthly, among the clergy religious fanaticism; and fifthly, political agitation. He then decides that the disadvantages of the voluntary system preponderate; and consequently that the absence of a religious establishment is among the defects of democracy.

It is obviously impossible that, within our limits, we should discuss the many questions thus raised; but we cannot refrain from considering a few of them. In the first place, the word "establishment" is ambiguous. It may bear the meaning which Lord Brougham has given to it, of a religious system patronized by law, with a preference given to it by the state over all other systems; and a preference given to its teachers over the teachers of all other forms of belief. That is to say, a *privileged church*. Or it may mean

merely an *endowed* church—a church whose ministers are either salaried by the state, or allowed by the state to possess property in their corporate, not in their individual character, but which receives from the state no other patronage or preference. Such is the Presbyterian church in Ireland; such are the various churches of Canada. If the bishops should be removed from the house of lords, diocesan courts and church-rates abolished, and the universities and the few offices from which they are now excluded opened to dissenters—events some of them certain, and all probable—the Church of England will cease to be a privileged church, but will continue an endowed one. Now, we see no reason for thinking that a church endowed, but not privileged, is inconsistent with democracy; and we are inclined to think that such a church may possess nearly all the advantages which belong to an establishment in Lord Brougham's sense, and be free from almost all its disadvantages.

Secondly, we do not perceive the incompatibility of even a privileged church with democracy. Some of the most democratic portions of Europe, Belgium, Norway, and parts of Switzerland, possess such churches. They are inconsistent, not with democracy generally, but with a democracy in which there is no one preponderant sect.

And lastly, Lord Brougham appears to us to take too English, and too Protestant a view of the voluntary system. The two countries in which that system prevails most extensively, are the United States and Ireland. In neither of them is there any want of religious teachers. The instruction may not be good, but it certainly is abundant. Again, throughout the Roman Catholic world, though the people may pay the priest, they neither elect, nor can they remove him. He is dependent on their favor for only a portion of his income. This dependence, indeed, has been sufficient, under peculiar circumstances, to render the Irish priest a most mischievous agitator; but such is not its necessary effect. In the United States, there is no clerical agitation. Everybody there is a politician, except the religious instructor.

On the whole, although we agree in Lord Brougham's preference of even a privileged church to the voluntary system, we do not think that the latter is open to all the objections which he has made; or that the former is necessarily incompatible with democracy.

We have now arrived at the fourth and last class of governments, those in which two or more of the three elements, the monarchical, the aristocratic, and the democratic—or, in other words, of the legislative powers of one, of a few, or of many—are combined.

It is obvious that such governments are divisible, according to the elements which they admit, into four. A mixed government may combine only the monarchical and democratic elements, or only the monarchical and aristocratic, or only the aristocratic and democratic, or may unite all three. The first of these is almost peculiar to small uncivilized tribes. As soon as such a tribe has swelled into a nation, the direct and constant exercise of power by the mass of the people becomes so difficult, that the chief makes himself absolute, and the government ceases to be mixed; or some smaller body is either substituted for the people, or appointed to share its power, and the constitution assumes one of the three other forms of mixed government. Nor is the mixture of monarchy and aristocracy common. A small select

body, neither restrained nor supported by the democratic element, either deposes the monarch and reigns, as in Venice, a pure aristocracy; or, as is more frequently the case, is itself deposed by him, and the result is a pure monarchy; or is forced to share its power with the monarch and the people, or with the people alone, and the government falls into one of the two remaining mixed forms. The mixture of the aristocratic and democratic forms is not uncommon. With the exception of Neuchâtel, which is purely monarchical, this is the constitution of all the Swiss cantons. It is the form into which the constitution of every country which rejects the monarchical principle seems naturally to fall. The most common, however, of mixed governments is the fourth, that in which the three elements are combined: and, what is more important, it is the form of government to which all nations seem to tend as they advance in greatness and in political knowledge.

But we now come to a set of cross divisions. Governments must be considered not merely according to the elements which they admit, but according to the mode and degree in which each element is admitted. The individual in whom the monarchical principle resides, may be hereditary or elected. If elected, he may be appointed for life, or for a term of years, or annually. The constituency that elects him may be aristocratic or democratic. If elected for a period, he may, or he may not, be reëligible. Some portion of the legislative power he must have; but he may have the initiative of all measures, or of some, or of none. He must have a veto; but it may be absolute or suspensive. He must be irresponsible while his power continues; but after it has ceased he may or may not be legally accountable for his conduct while in office. He may be authorized to exercise his powers personally, or only through his ministers. His ministers may or may not be responsible for his acts. Their offices may admit them to the legislative assemblies, or exclude them, or have nothing to do with their presence there.

So the body in which the democratic principle resides, may reserve some portion of direct legislative power, as in the case in the United States, where the constitution cannot be altered except by a convention, in which the electoral body becomes legislative; or it may part with the whole, as is the case in the British constitution. It may appoint its deputies for life, or for any shorter period. It may appoint them directly, or be authorized only to appoint electors. It may or may not be restricted in the selection of either the one or the other. It may or may not be empowered to bind its deputies by instructions.

These remarks are applicable, with little variation, to the body constituting the aristocratic element. There might be some pedantry, but there would be no impropriety, if we were to subject aristocratic bodies to the same division to which we have subjected governments; and to term a select legislative body appointed by the sovereign monarchical, an hereditary or self-perpetuated one aristocratic, one created directly or indirectly by the people democratic, and one in which two or more of these modes of creation or succession should concur, mixed.

Again, there is almost an equal variety in the modes in which the executive power may be distributed or collected. The monarch may have the whole, or some part of it, or none. In England, the aristocratic legislative body is also the highest

legal court of appeal. The initiative, and the details of arbitrary executive acts, belong principally to the democratic body, and occupy, under the name of private business, a very large portion of its time and attention. In the United States, the aristocratic legislative body shares with the monarch the power of making treaties, and of appointing some of the highest officers; and there are few modern constitutions in which the principal executive powers are not divided between the different legislative authorities.

The judicial power may be exercised by judges—hereditary, or appointed for life, or for a given period, or at the will of the appointer, or for one particular case. They may be appointed by the sovereign, or by a select body, or by the people, or by lot. Every one of these varieties may be found in one country. In fact, they all coexist in England.

Again, every mixed government is more or less exclusive, from that of France, where only about three persons out of a thousand have legislative power, direct or indirect, to those in Switzerland, in which every male above the age of sixteen is an elector, and for some purposes a legislator.

When the number of combinations is so vast, it appears to us to be dangerous to ascribe to the mixed form of government any qualities as universal, or even as general. A distinction, apparently trifling, of law, or of mere administration, may affect the whole working of a constitution. England is, we believe, the only country in the world in which the sovereign is not present at the meetings of his own cabinet. There is, perhaps, no other single cause which has tended so much to weaken the monarchical element in the English constitution. But it is no part of that constitution; it is a mere usage, which sprang up accidentally, in consequence of George the First's ignorance of English. Important as it is, and now we trust unalterable, the fact of its existence is little known out of the British islands, and perhaps is not notorious even there.

Again, in France, no proceedings can be taken against any officer of the government for any official act, unless by the permission of the government;—a permission which the government can refuse at its discretion, and in a large proportion of cases does refuse. This law can scarcely be said to affect the French constitution as a form of government. It does not render it more monarchical, aristocratic, or democratic; but its first effect is to deprive all the inhabitants of France of any legal security against the oppression of their government. Its second effect is to drive them to supply, by illegal resistance, the want of a legal remedy. In England, if a tax-collector should endeavor to enter a house in order to count the windows, the owner, after warning him of the consequence, would quietly submit, then bring his action, and be amply recompensed by damages. The collector knows this, and nothing of the kind takes place. In France, such an occurrence occasioned, a year or two ago, deplorable scenes of violence and bloodshed. The collectors and the inhabitants both believed that the government would protect its officers. The collectors tried to force their way into the houses, the inhabitants to repel them, and the consequence was a petty civil war.

Again, the American president is elected for only four years, but is then reëligible. Washington allowed himself to be reëlected once, but not

oftener. This example has been generally followed. No president has served more than eight years; but every one has served a candidate for reëlection at the end of his first term of four years, and many of them have succeeded. The consequence is, that the first business of every president is to secure his reëlection. To raise his own party and to depress his opponents—to dismiss the whole body of executive officers, and supply their places with his own partisans—to support slavery if he be strong in the south, or abolition if his strength lie in the north; to be a free-trader in the one case, and a protector of domestic industry in the other; to favor the great monied institutions if they support him; to destroy them, at the risk of paralyzing the whole commerce and industry of the country, if they oppose him; to be litigious, insolent, and warlike in his diplomacy, if his friends lie among the dealers in arms or in privateers, or among manufacturers anxious to engross the home market; to be pacific if he rely on the importers of plantation supplies, and the exporters of cotton or tobacco; but under all circumstances, to adopt the language, stiffen the prejudices, inflame the passions, and obey the orders of the mass of the people.—Such are the occupations in which every president spends the first four years of his reign, and, if he be not reëlected, the whole. To the influences which thus corrupt and degrade* the person who is both her chief magistrate and her prime minister, we attribute much of the deterioration of the public, and, we fear we must add, the private character of America—the bluster, the vanity, the rapacity, the violence, and the fraud, which render her a disgrace to democratic institutions, and a disgrace to the Anglo-Saxon race.

But if Washington had refused to be reëlected, it is probable that this frightful source of misgovernment and demoralization would never have broken out. The interests, and, what is more important, the passions of all parties, the jealousy of competitors, the inconstancy of the people, and the unpopularity which is unavoidably acquired in four years of supreme administration, would have effectually prevented any of his successors for asking for an honor and a power of which even Washington had not thought himself worthy. And though the constitution of America would have remained the same, its practical working would have been essentially altered.

Although, therefore, we have ventured to ascribe certain qualities to the three pure constitutions, or rather to the influence of the monarchical, aristocratic, and democratic elements respectively, we are afraid to give any general character to the indefinitely various forms in which those elements may be combined. All that we can affirm is, that it appears to be probable, first, That by combining the three elements, or at least two of them, a form of government may be obtained which, in ordinary circumstances, will be more favorable to the welfare of the people than any one of the simple forms. Secondly, That the forms under which there has been the greatest moral and intellectual progress, and, we are inclined to think, the greatest happiness, have been mixed. And Thirdly, That the very worst forms of government, forms which, like that of Poland, after having rendered nations for centuries misera-

* See a proposition, at the end of this article, for a conservative change of the constitution.—L. A.]

ble in themselves, and a source of misery to their neighbors, have utterly destroyed them, or been destroyed themselves, have also been mixed.

Lord Brougham is bolder. He states, that a mixed government possesses over all others, three great advantages, namely, first, "That it protects the public interest from rash, ill-concerted counsels; secondly, That it secures the freedom and the rights of all classes in the community; and lastly, That it maintains the stability of the political system."^{*}

Now it is certain that the introduction of the aristocratic element has a tendency to diminish the rashness, passion, and short-sightedness which belong sometimes to a pure monarchy, and always to a pure democracy; but it is by no means certain that the introduction of the democratic element would produce the same effect in a pure monarchy, or even in a pure aristocracy. The Venetian government, the most prudent that has ever existed, was a pure aristocracy. That of Prussia, also eminently prudent, is a pure monarchy. The conduct of France was far more prudent, her councils far less ill-concerted, before the revolution of 1789, than they have been since she substituted a mixed government for an absolute monarchy.

Again, the protection of the rights of all classes of the community, depends not so much on the government being mixed or pure, as on the degree in which it is exclusive. The excluded classes are always in danger of oppression, and many mixed governments have been eminently exclusive. It was the mixed exclusive government of England that enacted the penal laws against Roman Catholics. It was from the mixed exclusive government of Denmark that the people fled for refuge to an absolute king. The Austrian monarchy is pure in Lombardy and mixed in Hungary. But in Lombardy it is non-exclusive: no class has any privileges or immunities at the expense of the community. In Hungary, four fifths of the inhabitants are excluded from all political and from most social rights. Mixed government has not saved them; as it did not save the Roman Catholics of Ireland, from a degree of oppression to which no class is subject in any of the absolute European monarchies, except Russia and Turkey, if these monarchies are to be called European.

Lastly, There are reasons for doubting the superior stability of mixed governments. Pure democracies, indeed, are necessarily unstable. They must be destroyed by the mere increase of territory or of population; but many pure monarchies have endured for centuries undisturbed by any serious internal commotion. So have some pure aristocracies. Perhaps, when we consider the rarity of that form of government, and the frequency of the mixed form, the former has exhibited as much stability as the latter. On the whole, we are inclined so far to disagree from Lord Brougham as to think, that a pure monarchy, or a pure aristocracy, is more stable than any mixed form admitting only two elements; but so far to agree with him as to believe, that the greatest amount of stability is to be obtained by the union of all three.

Throughout this discussion we have adhered to our own nomenclature, and have included among mixed governments those in which the body of the people act through their representatives.

If we had adopted the nomenclature of Lord Brougham, and had included among pure democracies all governments in which the legislative authorities are elected directly or even indirectly by the people, we should scarcely have ventured to attribute to mixed government even the qualified superiority which we have assigned to it. If the president and the senate of the United States were elected for life; if the president could act only by the advice of his ministers, and those ministers were responsible, and instead of being excluded from Congress, were *ex-officio* members—the constitution would still, according to Lord Brougham's nomenclature, be not a mixed government but a pure democracy, since all legislative, and indeed all executive authority would flow, directly or indirectly, from the people. But we are inclined to think that such a constitution would work well;—quite as well as if the president, or the senate, or both of them, were rendered hereditary, and the constitution thus changed from pure to mixed. In the very striking chapter in which Lord Brougham anticipates the consequences of the further moral and intellectual improvement of mankind,* he states that a progress is making by the people which will in time enable old countries to be governed democratically; and that the tendency of human affairs is, that the people should select their chief magistrate. And if they elect their king and their house of commons, it is nearly certain that they will also think fit to elect their house of lords. We are not sure that for a well-educated people this would not be the best constitution; and if it is to be called a pure democracy, we can no longer affirm, as a universal proposition, that a mixed constitution always offers better chances for public welfare than a pure one.

We have now to consider an institution which is treated by Lord Brougham as compatible with every form except pure monarchy and aristocracy, and by us as confined to mixed government—representation.

Representation, however, is not a subject to be discussed in a couple of pages. We shall shortly sum up the most important of Lord Brougham's conclusions, without expressing dissent or concurrence. Where we agree with him, the mere expression of our assent could add nothing to his authority; and where we disagree, the mere expression of our dissent, unsupported by argument, would be dogmatical, and, indeed, presumptuous.

The substance of Lord Brougham's canons of representative government is this:—

The power of the people is to be transferred for a period exceeding one year, but not exceeding three years, to their representative. They are not to attempt to resume it during that time, or to fetter him by instructions. There should be no qualification of eligibility; and all persons of full age, unconvicted of infamous offences, who have received a good plain education, should be electors. The election should be direct, and by open voting, but in such a manner (*how* is not specified) as to protect the voters' independence. The constituencies should consist, not of mere towns or counties, but of electoral districts so large as to prevent corruption—from five thousand to six thousand electors being the *minimum*—and so arranged as to secure representatives of all the great

* Vol. iii., p. 158.

* Vol. iii., chap. xx.

classes in the community, but not giving to any one large town a proportionate and therefore a very numerous representation.

To these canons Lord Brougham allows no exception. He does not propose them merely as the theoretic principles of the best form of representative government, but as the principles to which every such government ought to be made to conform. Many years ago, in his Letter to Lord John Russell, he recommended their adoption, so far as they have not been already so adopted, into the British constitution. It is therefore Lord Brougham's deliberate advice that the British house of commons should be triennial; and should be chosen in large electoral districts by the suffrage of all persons who have received a good plain education; which in a short time must practically be universal suffrage. Now, without infringing our rule of expressing on the subject of representation neither assent nor dissent, we may remark that such a change would be a revolution—using that word to signify not a violent anarchical movement, but a change in the depositaries of power. It would greatly increase the democratic power, and it would place that power in the hands of those who have now no share in it, or a share so small as to leave them almost without influence. It would exceed in magnitude the changes effected by the Reform act—at least as much as those changes exceeded all that was proposed by Mr. Pitt or by Mr. Brougham.

We have now reached the last of the portions of Lord Brougham's work which we have selected for criticism—his view of the existing British constitution. It is to be observed that his exposition is not merely legal, but also practical; that he states not merely the theory of the constitution, but its actual working.

"The great virtue," he says, of the constitution of England, is the purity in which it recognizes and establishes the fundamental principle of all mixed governments; that the supreme power of the state being vested in several bodies, the consent of each is required to the performance of any legislative act; and that no change can be made in the laws, nor any addition to them, nor any act done affecting the lives, liberties, or property of the people, without the full and deliberate assent of each of the ruling powers.*

Consistently with this view, he holds that the constitution wills that the opinions of the monarch "should have a sensible weight, even against the most conflicting sentiments of the people and of the peers,"† and should operate as a check on the other branches of the system. And he further maintains, that the government cannot be carried on for any length of time, unless the ministers of the day have the decided support of both houses of parliament.‡

We venture to question this view both in theory and in practice. It appears to us that important legislation has taken place in past times, and is likely to occur in future times, against the deliberate will of one, and sometimes of two, of the ruling bodies; and, further, that the government can be carried on for an indefinite period with a decided majority in only one house of parliament; and, lastly, we believe that those who gradually introduced the usages, the aggregate of which forms the British constitution, intended that this should be the case. For the facts, we need refer

only to the most recent history—to the Emancipation act, carried against the deliberate will of George the Fourth; to the Reform act, carried against the deliberate will of the house of lords; to much subsequent legislation, disapproved of by both the crown and the peers; and to Lord Grey's ministry—the most powerful at home and abroad, the strongest in every way that modern times have seen—ruling not merely without the support of both houses, but opposed in one of them by a decided and constantly-increasing majority. If it be said that in these cases the consent of the sovereign and of the peers, however reluctant, was in fact given, the answer is, that it was given because the constitution itself prevented its refusal. The sovereign acts only through his ministers, and no minister would have dared to advise George the Fourth to veto the emancipation bill. The majority of the house of lords knew that a few pieces of parchment could convert it into a minority. They believed that the expedient would be used; and though they refused their consent to the Reform bill, they neglected to record their dissent. If the constitution had willed, "that the individual monarch should be a substantive part of the political system as a check on the other branches,"* it would have allowed him liberty of action. It would not have required that to give validity to his acts other persons should adopt them, and assume their responsibility. The fact is, that the influence really exercised by the sovereign is unconstitutionally exercised. The constitution supposes the crown to take no part in legislation, until the proposed law has passed through both houses. In the rare cases in which the sovereign has interfered in legislation, he has done so by preventing the introduction into parliament of the measures to which he was opposed, and we doubt whether such a case will ever occur again. "If he can find any eight or ten men," says Lord Brougham, "in whom he has confidence, who are willing to serve him, and whom the houses will not reject, he has the choice of those to whom the administration of affairs shall be confided."† Certainly; but in general it is found that there are only eight or ten men in the kingdom who are willing to serve him, and whom the houses will not reject. It has frequently happened that these were not the eight or ten men in whom the sovereign had confidence; but he has been obliged to continue, or even to appoint them ministers. His right of choice is that given by a *conseil d'état*.

Again; if the framers of the constitution had intended "the separation and entire independence of its component parts;"‡ if they had intended that the house of lords should possess a real "veto upon all the measures that pass the commons,"§ it seems inconceivable that they should have subjected that house to absolute dependence on the crown—that they should have allowed the sovereign to pack it at his pleasure:—to give it a tory, a whig, or a radical majority, as often as he may think fit. Nor can it be said that this power is obsolete, or even dormant. It was used by Lord Oxford—it was used by Lord Brougham—it was abused by Mr. Pitt. He packed the Irish house of lords, by adding to it more than one hundred and fifty peers—forty-six of them in one year; and then to make this gross injustice irre-

* Vol. iii., p. 295. † *Ibid.*, p. 302. ‡ *Ibid.*, p. 315.

* Vol. iii., p. 302.
‡ *Ibid.*, p. 301.

† *Ibid.*
§ *Ibid.*, p. 305.

parable, prohibited by the act of union its further increase. He found the British house consisting of only two hundred and ten temporal peers; in thirteen years he added to it eighty-five. When the tory reign ended with Lord Liverpool, one hundred and seventy-eight British peers, and twenty-eight Irish, all belonging to one party, had been added to it. If it be true that no government can be carried on unless the minister have a decided majority in the house of lords, either the government of the party now in power is immortal, or the accession of a liberal minister must be accompanied by the creation of two hundred peers.

If we reason with respect to the British constitution as we do with respect to every other elaborate contrivance;—if we infer the intentions of its framers from the results which they have effected—it appears clear that differences of opinion between the three legislative bodies were foreseen, and means taken to give a decided preponderance to that which should have the support of the people. We say, which should have the support of the people; because the house of commons, unless decidedly supported by the people—that is to say, by the constituencies—is not merely the weakest of the three estates, but is absolutely powerless; but supported by the people, it rules easily if one of the other two estates assist it; and rules, though not without difficulty, even if the other two oppose it. Thus the commons and the crown united, can at once trample under foot the opposition of the lords; the commons and the lords united are practically in no danger of opposition from the crown, and if opposition were to take place, could terminate it by depriving the sovereign of his ministers. But the crown and the lords united, are impotent against a house of commons backed by its constituencies. All that they can do is to dissolve; and a reëlection sends them back only a more numerous and a more determined opposition. It must have been for the purpose of producing this result, that the power of creating new boroughs was gradually withdrawn from the crown. While that power existed, the commons were as much at the mercy of the crown as the lords are now. As soon as it ceased, they became as independent as the lords would have become, if the bill which restricted the power of creating peers had passed. Those who deprived the crown of the power of increasing or packing the house of commons, and those who continued to the crown the power of increasing and packing the house of lords, must have intended, that in the British constitution the democratic element should be supreme.

There is no proposal for constitutional change that Lord Brougham dismisses so contemptuously, as an alteration in the constitution of the house of lords. "It deserves," he says, "to be noted, that all these senseless projects have long since been abandoned by their thoughtless authors, who, a few years ago, considered the safety of the empire to depend upon what they termed Peerage Reform."^{*} He believes that the consequences of a large creation in 1832 would have been dreadful; that it would inevitably have ruined the constitution.† Now, we dread all great changes simply because they are great changes—because we know that their whole results never can be anticipated—and that even if they effect their

intended purposes, they may effect them at a sacrifice which would not have been submitted to, if it had been foreseen. We do not believe, indeed, that peerage reform would produce so great a change as is expected by its enemies, or by its friends; but the change would be great, and that is a sufficient reason for avoiding, or, at all events, for deferring it, as long as it can be deferred. But we cannot think that it is a senseless project. We cannot but feel that a state of circumstances is possible, we trust not probable, in which it may be beneficial and even necessary. While the house of lords plays no part in the great game of political power—while it contents itself with performing the important but subordinate duties of a court of revision, in which the legislation of the commons is reconsidered, improved, suspended—and, when the popular will is not decidedly expressed, even rejected, it will continue unaltered in form, and, unless some profligate administration should repeat Mr. Pitt's profuse creations, unaltered in substance; but, if in an evil hour it should assume equality with the commons—if it should attempt to share the sovereignty which that house now exclusively exercises—if it should try to dictate what party and what persons shall be our governors, the days of its apparent independence are numbered.

We will explain our views by supposing a possible, though certainly not a probable, state of circumstances: Suppose that, in the last session, the public opinion of the constituent bodies had been decidedly in favor of a ten hours' bill—that Sir Robert Peel had resisted, had dissolved, and had been met by a house of commons with a hostile majority of 300, and had endeavored to govern with only 150 supporters—had endeavored, in short, to treat the house of commons as more than one minister has treated the house of lords—the commons would have passed a vote of want of confidence. If that produced no effect, they would have addressed the crown to remove its ministers—if that failed, they would have stopped the supplies. As the hostile majority would have been unassailable, as a fresh dissolution would only have increased its numbers and its determination, the crown must have complied, and appointed a new administration. If now the house of lords had followed the precedent set by the commons—if it had resolved that the new cabinet had not its confidence—had requested its removal—and had enforced that request by rejecting the money bills and the mutiny bill, the necessary consequence would have been, not that the commons or the crown would have yielded, but that the hostile majority of the peers would have been neutralized by a large creation; and the result of one or two such occurrences must be peerage reform. The house of lords would soon become too large to act as a deliberating body; and the course which has been twice taken to meet that difficulty would be repeated. At the time of the Union with Scotland, it was supposed that the introduction of all the Scotch peers would form too large an accession to the house; they were required, therefore, to select representatives out of their own body. The same objection was removed by the same expedient on the Union with Ireland. The distinctions between British, Irish, and Scotch peers, now become useless, would be abolished; and on every new parliament the whole peerage would be required to select a representative body. Such a body, if persons filling or who had filled certain

* Vol. ii., p. 16.

† Vol. iii., p. 306.

high offices, were *ex-officio* members, would constitute an aristocratic assembly; perhaps not remarkably inferior in virtue, in knowledge, in talents, in diligence, and even in wealth, to that which it is now our happiness to possess.

It is true that it would not be independent; since any minister, enjoying the decided support of the country and of the house of commons, would be able, by a creation and a dissolution, to obtain a majority in the lords. But, under such circumstances, is the house of lords now, under the existing system, independent? Its independence is confined to the case of parties in the country, and in the house of commons, being nearly equally balanced. In such a case the power of creation is virtually suspended. If the minister, with a majority of twenty-five, create peers from the house of commons, he destroys his majority, even if he should lose only one reelection out of three. If, to avoid this, he exclude from the peerage his supporters, he equally destroys his majority by disgusting the vain and selfish portion of his adherents; but if he have such a majority in the house as to be able to bear some loss on elections, and such a majority in the constituencies as will render that loss trifling, he can now govern the lords by the threat implied, rather than expressed, of mere creation;—as effectually, perhaps, as he could do after the supposed peerage reform, when there would be the further necessity of a dissolution.

A few years ago, there did appear to be almost a probability that such a reform might become necessary. The house of lords indeed abstained not only from straining, but, in a great measure, from exercising its political as distinguished from its legislative powers. Though exempt from dissolution and safe from creation, not merely independent, but if such were its desire, dominant; with the power of expelling by a single vote an administration which it disliked and distrusted, it yet refrained from giving that vote. It did not address the crown to dismiss its ministers, though such an address would, in the then state of parties, have been a command; but it displayed a temper, and pursued a course of obstruction, which excited alarm among our most intrepid and our wisest statesmen.

"Year after year," says Lord John Russell, "the commons grow more impatient at the frustration of measures for which they have labored for many a weary night, which contain nothing revolutionary or intemperate, and which are dispatched before dinner by some thirty peers, who, without reading the bills, and without listening to explanation, mar the fruits of a session. Year after year, the lords, strong in their numbers, grow more and more eager for decisive battle. With these dispositions, the superiority of the lords in matters of government may one day be asserted, or England may no longer bear the double sway of government in one house, and opposition in the other. Who are in that case to give the victory? Evidently the people of the United Kingdom. The country will ask in the end whether these measures were useful; and if so, why they were rejected? They will inquire who they are who have misused the power of legislation to indulge a party spleen; and those on whom that charge justly rests, will be the losers in the conflict."^{*}

The conflict which Lord John Russell depre-

^{*} Letter to the Electors of Stroud, 1839, p. 41—43.

ated, was averted, partly by the wisdom, firmness, and authority of the Duke of Wellington, and partly by the speedy termination of the real struggle in the house of commons. We now know, that such was the temper of the constituencies in 1839 and 1840, that if it had taken place, the victory would have rested with the lords. On a dissolution, the people would have sided with them. The danger lay in the precedent;—in the fear that, in a different state of public feeling, the lords, pleased with their apparent recovery of political power, might, on some other occasion, exercise their legal right to oppose the popular will; and thus force the crown to exercise its legal right of putting down that opposition by a creation, which, in the state of parties which now exists, or in any which can be expected to exist in that house, must be a very numerous one; and then, as we said before, peerage reform is inevitable. If that event should actually occur—if the most distinguished, and, on the whole, the most enlightened hereditary body that the world has ever seen, should be changed into an elected senate, on whom will the responsibility rest?—On those who endeavor to alarm the prudence of the house of lords, or on those who may inflame its ambition? On those who, by pointing out its political subordination, endeavor to secure its legislative authority; or on those who may tempt it to temporary triumph, and ultimate defeat, by ascribing to it a political independence and a political equality, which it possesses neither in theory nor in practice? On those who may have to sacrifice its existing constitution to the welfare of the state; or on those who, without any necessity—in the mere insolence of power, by the wanton creations of forty years—converted it from a moderately-sized council, fairly representing both the great parties, into a large assembly; in which one set of opinions is always persisted in, one class of measures approved, and one body of leaders supported, by the same overwhelming and hereditary majority!

We now close these volumes, with gratitude to the author, for much amusement, information, and instruction—with respect for his learning, and with admiration of his genius. We feel that the account which we have given of his work is very imperfect. We have been forced to omit the whole of the historical portion, and many philosophical discussions of great merit; among others, those on Party, on Checks, on Federal Union, and on Judicial arrangements. This, however, is not of much importance. Lord Brougham will be read in his own, not in our pages. On looking back at what we have written, we are struck by its controversial tone. This is perhaps unavoidable in criticism, where the subject-matter admits of only probable reasoning. On such subjects, when there is perfect coincidence of opinion in the author and the critic, there is little opportunity and no necessity for remark; but when this perfect coincidence does not exist, if the matter be important, the critic feels bound to express his dissent; and, if the author be one whose opinions carry great weight, to support it by argument and illustration. We have agreed in opinion with Lord Brougham much oftener than we have disagreed; but in the one case we have generally been silent—in the other, we have thought it necessary to state at some length the grounds of our dissent. No one, we are sure, will judge us with more candor than the great author himself.

He will feel that, whenever we have ventured to express dissent, it has been from no love of paradox or of opposition, but from a sincere difference of opinion on some of the most important, and, at the same time, most doubtful questions on which the human mind can be employed.

We are so deeply impressed with the truth of the opinions of the Edinburgh Reviewer, as to the tendency of reflecting the President—that we again ask the attention of our readers to remarks published four years ago, and then favorably received by some influential journals.

PRESIDENT OF THE UNITED STATES.

It seems probable, that soon or late, an alteration will be made in the Constitution, by which a president of the United States shall be prohibited from reelection.

If the change be now made, it can be accompanied by some other modifications and provisions which appear to us likely to be advantageous.

As the constitution now stands, a man whom the people delight to trust and honor, may be retained in their service, in this capacity as long as they please. And it seems desirable, that one who has long given his mind and his heart to questions of national policy—who has accumulated a vast stock of knowledge and wisdom—and who by his position at the head of the government has had, confidentially as it were, unusual opportunities of learning many of the secret springs by which our own and foreign affairs are moved—it seems desirable that such a man should not be ostracised, and that for the simple reason that he is *the just*, that is to say, in the opinion of the majority of the people.

We may readily imagine that at so early an age as *forty*, a man might, by great energy and wisdom in some public emergency, have been advanced to this highest elective post in the world. Is it expedient then, after drawing what advantage we can from him for four years, to cast him aside from the public service? His early elevation would thus prove an evil to himself and to the country. Far better for both had he continued twenty-five years longer in a subordinate station.

And yet there are many disadvantages attending the reeligibility of the president. Upon these we need say nothing, as public opinion seems to be settled.

We now beg leave to offer to the consideration of the members of congress and of the state legislatures, the following

AMENDMENT.

The president of the United States shall be elected for seven years, and shall not a second time be eligible to the office. But after the expiration of his term of service, he shall be ex officio a member of the senate of the United States.

It seems to us that it would greatly add to the beauty and strength of our government, to retain the presence and the experience of even the very few persons who could ever be in the senate in such a capacity. Who does not see that the services of Mr. Adams, with his incomparable memory of everything that has occurred during his long life, would be of great importance? And General Jackson, although he disappointed the high hopes we formed of him, we should be glad

that the influence he continued to exercise, should have been wielded from his place in the senate. To Mr. Van Buren, partly from his opposition to De Witt Clinton in the state of New York, but mainly from other causes, we have been as steadily opposed as any other person can have been; and yet we should be glad to provide an honorable and important position for him, in which he could bring to bear upon questions of moment, the knowledge and experience he has acquired.

To all *conservatives*, we say in conclusion, that such an alteration as we have proposed, is more in accordance with the general plan of the constitution, than the single alteration of making the office for one term of four years and no more.

Publishers' Circular, Feb. 1841.

SONG OF EXPECTATION.

"Until the day break and the shadows flee away, I will get me to the mountain."—Cant. iv. 6.
"Looking for that blessed hope."—Titus ii. 13.

To watch the morning's dawn
I'll get me to the hill,
And till the shadows flee away,
I'll keep the watch-tower still.

For morning surely comes,
And who can paint its light?
Eternal glory is at hand,
To chase the dreary night.

Oh! I would catch its earliest gleam,
To set my soul on fire,
And such seraphic ardors breathe,
As angel hosts inspire.

For long our pilgrimage hath been,
And dark the pilgrin's day,
The coming glory, blessed hope,
Chief solace of our way.

And though the glory lingers yet,
It cheers the fainting eye,
To mark, amidst surrounding gloom,
The star of prophecy.

I'll trim my lamp the while,
And chant a midnight lay,
Till perfect light and gladness come,
In glory's endless day.

From the Sailor's Magazine.

THE EVENING STAR.

STAR of the mariner! thy car,
O'er the blue waters twinkling clearly,
Reminds him of his home afar,
And scenes he still loves—oh! how dearly!
He sees his native fields—he sees
Grey twilight gathering o'er his mountains,
And hears the murmuring of green trees,
The bleat of flocks and gush of fountains:—
How beautiful, when, through the shrouds
The fierce presaging storm-winds rattle,
Thou glitterest clear amid the clouds,
O'er waves that lash and gales that battle;
And as, athwart the billows driven,
He turns to Thee in fond devotion,
Star of the sea! thou tell'st that heaven
O'erlooks alike both Land and Ocean

THE RIGHT OF SEARCH COMMISSION.

DIPLOMATISTS have taken a leaf out of the book of parliamentary tacticians. Our late ministers carried to perfection the art of substituting commissions when acts of parliament might, by provoking a collision between two great parties, have endangered their own tenure of office. Our present ministers have extended its range of application, by appointing a commission to examine evidence and report on a substitute for the Right of Search Treaties with France, instead of negotiating about them. At this moment any definite settlement of the Right of Search controversy would create a dangerous excitement either in France or England; but the report of a commission will set men to think and talk about minor matters, and keep them from insisting upon immediate action, where immediate action would be dangerous.

A more impracticable task than has been imposed upon the Duc De Broglie and Sir Stephen Lushington, if it is expected that they are to do more than serve as lightning-conductors to a dangerous excitement, can scarcely be imagined. They are to devise a means of repressing the slave-trade, equally efficacious with a right of search strictly enforced. "Results in the way of repression, at least equal to those which the right of search has led us to hope for," are said to be required by M. Guizot himself. The attempt to put an end to the slave-trade by force is to be persevered in. At least this appears to be the only intelligible interpretation of the language used in the letters both of the French and English ministers. And if this interpretation is correct—if the forcible suppression of the slave-trade is still contemplated—mutual right of search is indispensable to its attainment.

The soreness excited by the Right of Search Treaties has its origin in the obstructions which arise under them to commerce and navigation within certain latitudes. The same or equal obstructions would arise under any other efficient measures for the forcible suppression of the slave-trade, if such could be devised. It is impossible to discover from the outside of a vessel what it carries in the hold. The repression of the slave-trade by naval armaments requires that the mere appearance of a vessel in the waters where the slave-trade is carried on should render it an object of suspicion and liable to be searched. The loss of time, profit, and temper, occasioned by the exercise of so stringent a police, cannot be materially lessened to traders by subjecting them only to searchers of their own nation. The privilege of being searched by a countryman of their own would not go far to reconcile the passengers in St. James' street to a preventive police established to put down gambling-houses. Such a preventive police would soon lead to the desertion of the quarter within which it had authority, to the deterioration of property and the extinction of traffic: and the African Coast Guard has precisely the same effect. For one kidnapper whose ends are frustrated by it, twenty men are prevented from turning an honest penny. Lord Aberdeen says, indeed, that "the stipulations [of the Right of Search Treaties] have proved effective:" but the witnesses examined by the West African and West Indian committees of the house of commons—the slave-trade papers annually laid before parliament—nay, the West African corre-

spondents of the last number of the *Anti-Slavery Reporter*—prove that the slave-trade is undiminished either in extent or cruelty. The fair trader, on the contrary, is scared from the coast of Africa by the armed inquisitors, and roused to make common cause with the slave-trader in crying out against them. National pride may increase the irritation which this interference with traffic creates: but the real substantial grievance is the oppression of all, inseparable from the stringent methods adopted to suppress the slave-trade.

The Duc De Broglie has a reputation to support. He is regarded as one of the most earnest and sincere, and at the same time as one of the most reasonable opponents of negro slavery. And he has the character of a practical man—of one who has stood aloof from the acceptance of public offices from disinclination to accept the show without the substance of power. When he undertakes a task, men infer that its accomplishment is sincerely wished. But will this estimate of his character continue to prevail, if he has consented to act on the Right of Search commission under the limitations which the language of Lord Aberdeen and M. Guizot implies? To the success of the Commission it seems necessary that they should be at liberty to recommend other than forcible means of putting an end to the slave-trade, and to slavery.—*Spectator*, 15 Feb.

A VISION OF REPEAL.

THE Irish repealers are strange people. Talk of Ireland's disordered state, and you are angrily told that no country is so quiet: say that it is quiet, and you are more angrily assured that it is agitated. Ireland, says the Queen's speech, is tranquil: the Town Council of Limerick "resolves" that Ireland is agitated! Some little time back, Mr. O'Connell thought that federalism was not so very bad a thing; and straightway young Ireland was open-mouthed against him for abandoning "simple repeal." He has reverted to his old assurance that repeal is certain and swift: now, Young Ireland, speaking through the *Nation*, speaks of repeal as a thing which is to happen in some indefinite future. There is wonderful naïveté in these passages:

"The task undertaken by the repealers is to regain their country from its foreign rulers. It is a great and difficult task. In 1843 there seemed a possibility of carrying repeal by the hurrah of agitation. *That is proved impossible.* We must now win by the glow and ceaseless cultivation of our strength till it is able to cope with our enemy. We cannot succeed by surprise now. Peel is wide awake. Were the monster meetings to re-assemble, he would not fear them. He dreaded them as the preliminaries of insurrection. He would be (as he was) indifferent to them as expressions of public opinion. He fears no power save that which can outvote him in the senate, or oppress his exchequer by the costs of war. *Nor can we longer rely on the accident of an European quarrel.* That may come, or rather, will come; but if, ere it come, the people of Ireland are prostrate, *how will it save us?* To trust to it were unsafe and unworthy. We must free ourselves. The repealers must cultivate their strength till they are able for their great work. They must conciliate the protestants; proving to them, not by empty words, but by their whole lives and acts, that there is no Catholic bigotry in Ireland,

and that religious liberty is as dear to one church as the other. . . . Next in value to Protestant conciliation is the improvement of the repealers themselves, both individually and as a league. *Ere we can take Ireland from the English, we must know more than they do*—we must be their superiors in wisdom and virtue. The sons of the repealers are learning those elements of thought, which, guided as they are to patriotic ends by the surrounding agitation, will make them the terror of England, if England's misrule should survive their boyhood. In the district reading-rooms the people can study the state and history of their country."

"Much virtue in *it!*" Here repeal is put as a mere contingency, with such vast conditions, that skeptics as to the perfectibility of human nature would accept the whole statement as a periphrastic form of saying that repeal of the Union is impossible; just as Acis describes the impossibility of repealing his union with Galatea—

"The flocks shall leave the mountains,
The woods the turtle-dove,
The nymphs forsake the fountains,
Ere I forsake my love."

However, there is a great deal of sound advice involved in this curious statement by the *Nation*. It reminds us of the dying farmer who told his sons to dig for a treasure in his field; the profit from thoroughly digging the soil and rendering it fertile being the real treasure, which alone they actually discovered. The *Nation* tells its countrymen to do such things as a means of attaining repeal, that Ireland must benefit though it never find its promised object. If the country were to fulfil the injunction, it would indeed grasp power: if it were really to know more than England, not London but Dublin would be the capital of the United Kingdom: if it were to become a nation of Humes and Hallams, a people of thinkers, it might defy misrule of any sort. We only dissent from the supposition that it would then be "the terror of England:" on the contrary, it would be a safeguard and refuge for us. And as we do not see under what engagement England will lie to stand still in this process of study in wisdom and virtue, we trust that she too will not suffer Ireland to "take her down" in class, but will also make such progress that both will jointly constitute the *decus et tutamen* of the civilized world. The *Nation* says that repeal is impossible until some such time: we say that it would be more impossible than that ever: for union would then be as dear to both as "showers to larks," or "sunshine to the bee."—*Spectator*, 15 Feb.

ACCIDENT TO MR. WAKLEY.

We have the evidence of that great physiologist, Mrs. Malaprop, that in the East figures are very unmanageable, when she observes that some one is "as headstrong as an allegory on the banks of the Nile." There are monsters as dangerous on the banks of the Thames; and sometimes they wander into the low buildings and seize upon the inmates. The house of commons is much infested; and, melancholy to relate, on Thursday evening Mr. Wakley was obstinately attacked by a metaphor; from which he was with great difficulty rescued by the whole house; all his fellow members, much to their credit, hastening, without

distinctions of party, to drive the monster away by their shouts. The unfortunate gentleman, unconscious of his danger, was sportively talking of the object which the Prince De Joinville had in magnifying the power of the British steam-marine, in order to rouse the French people to rival it.

"He looked through the wrong end of the telescope, in order to make our power appear to his countrymen as small as possible. (*A laugh.*) He meant that he looked through the right side of the telescope to make our power appear as small as possible. (*Laughter, and cries of "Large, large!"*) No; small, small! (*Laughter.*) Really, they were very merry; but they were mistaken, and he was correct. The prince, for his own sake, wished to ascertain our real dimensions; but he got his countrymen to view us through the telescope, in order that our power might appear to them as small as possible. (*Renewed laughter.*) Really, after all, they were right, and he was wrong—he meant as large as possible." (*Laughter, and "Hear, hear."*)

We understand that Mr. Wakley sustained no serious injury from the seizure, and that he so far recovered as to be able to walk home.—*Spectator*.

THE MAGIC BALL.

THE *Siècle* of Paris relates a strange incident, but obviously mistakes the gist of the matter. During the Carnival, the Duc De Nemours gave a series of balls and concerts, for each of which there was a distinct list of invitations. Persons of mature age were to be invited to the concerts, and only young persons to the balls. We now quote the words of the *Siècle*—

"On the occasion of the last ball, to the astonishment of the prince, all the company were elderly. There were gentry, peers of France, aged spinsters, dowager duchesses, and hobbling members of the Chamber of Deputies. When the orchestra struck up a quadrille, the company were as astounded as the prince; but as etiquette seemed to require that they should dance, a quadrille was formed, and the good old folks went through it, to the great amusement of the spectators; who could not, however, venture to indulge in a laugh, lest they in their turn might be laughed at. A mistake had been made in the list of invitations; but the mischief being done, nothing could be said about it, and the peers and peeresses, grave lawyers and antiquated deputies, shuffled through the evening, to their no small mortification."

Their mortification! *Credat Judeus.* The Duke is a "deep one," and he understands human nature. He proved it when he struck out the plan of dining all the world to make the way to his dotation; but this last is a stroke even beyond the dinner. Of all passions in the human breast, the desire to resist the encroachment of time is the strongest. The very mirror is disbelieved; the wrinkles of the face are unseen in the accommodating simper with which the glass is approached, and the reflector of truth is wheedled into telling a falsehood. The hair turns gray in vain—it is anxiety. Children grow to manhood and womanhood—but they are still called children. The ear learns the trick of accepting truth with a difference. But there is one fatal sign that cannot be misconceived: balls are given, and for the first

time the aging dancer *is not invited!* Appalling negation! Who can resist that conviction! One's dancing-days are then really over—Tithonus is not immortal! There is no attempt to resist that inevitable decree—the victim yields to fate in silent despair. But Nemours has struck that deadened chord, and wakened it to rapture. The uninvited have been invited! It was accident—quite accident—nobody meant a frolic; all was meant to be decorous; but it did so happen. The antiquated peers, the dowager duchesses, the aged spinsters, again threaded the mazy dance. The limbs perchance were stiff—the pas de zephyr was not very aerial—the knees may have tottered—the thrill of pleasure was less tumultuous; but a generation was struck from the rolls of time, and once more before the tomb, the faithful swain (faithful or not) pursued with measured ardor the goddess of his devoirs, as if it were decreed—

“Forever shalt thou play, and she be fair.”

And the duke has given them this *bonne bouche* of existence. He has secured the votes of the old ones.—*Spectator*.

REV. SYDNEY SMITH.

AMONG the aged public men who have just been carried off by the protracted hard weather, none will be more regretted than the Reverend Sydney Smith; whose wit was somewhat too vivacious for the dull decorum of ecclesiastical etiquettes, though its brilliancy did not conceal sterling worth and benevolence. Sydney Smith, scion of a Devonshire family, was born in 1768, at Woodford, in Essex. He was educated at Winchester school, and in New College, Oxford; where, in 1790, he obtained a fellowship, and, in 1796, the degree of M.A. Having been appointed to the cure of Netheravon, near Amesbury, he became tutor to the son of Mr. Hicks Beach; with whom he resided for some years in Edinburgh. While there, he officiated at the episcopal chapel: but the most notable result of his sojourn was the *Edinburgh Review*, established at his suggestion, and first edited by him. In 1803, he came to London; and married the daughter of Mr. Pybus the banker. His preaching attracted full and fashionable audiences to the Foundling Hospital, the Berkely and Fitzroy Chapels. The whig ministry of 1806 conferred upon him the living of Frostonin, in Yorkshire; and on the expulsion of his patrons by the “No-Popery” cry appeared his celebrated *Letters of Peter Plymley to his Brother Abraham in the Country*,—immortal specimens of sparkling wit and forcible logic. In 1829, Mr. Smith received the rectory of Combe Florey in Somersetshire, valued at 300l. a year; and in 1831, under the ministry of Lord Grey, he became one of the canons residentiary of St. Paul's Cathedral. An interesting writer in the *Times* gives a masterly review of the career of the liberal wit. “In everything which he attempted he appears to have been eminently successful. At college, he graduated with honor, and obtained a fellowship. He projected and contributed to a review, which has enjoyed the highest degree of prosperity; he attempted an ambitious style of preaching, with a vigor of talent which distanced all rivalry; he became a public lecturer, and the whole world of Mayfair flocked to Albemarle street to enjoy his humor and become enlightened by his researches; he published political works, which have gone

through editions so numerous that as many as twenty thousand copies of some have been sold; he lived long enough to enjoy his reputation, and to attain to a greater age than falls to the lot of ordinary mortals; and yet those who appreciate wit, who can admire learning, and who honor the man that used both for the good of his species, will be disposed to think that, old as Sydney Smith was, he died too soon. When a person of high intellectual power is removed from this life, the place which he occupied is never again really filled. One public functionary may succeed to another, one professional man may discharge the duties which for a long time devolved upon his predecessor; as generation follows generation in the ordinary course of human life, one man fills the place that another had occupied; but such is the quality of genius—so perfect is its individuality, so peculiar its attributes—that it is “itself alone,” and the void which its removal occasions must long continue to be perceptible. In no case has this truth been more generally acknowledged than in that of Sydney Smith. * * * The conversational witticisms of Sydney Smith would fill a jest book; but his character will be estimated by posterity on far higher grounds. When his “quips and cranks” are lost and forgotten, it will be remembered that he supported Roman Catholic claims, and that they were conceded; that he strenuously assailed the Game laws, and that they underwent great modification; that he compelled a large portion of the public to acknowledge the mischief of our penal settlements; that he became the advocate of the wretched chimney-sweepers, and their miseries were alleviated; that he contended against many of the unjust provisions of the church reform bill, and they were amended; that whereas, before his time, a man accused at the bar of a criminal court might be hanged before he had been half heard, now every prisoner has the benefit of a defence by counsel. It will further be freely acknowledged, that no public writer was more successful than he in denouncing a political humbug, or demolishing a literary pretender; that he was on the whole an upright and a benevolent man; and, as the world goes, a disinterested politician; that he had opportunities of improving his fortune which he nobly rejected; and that, having lived with unostentatious respectability, he died without accumulating wealth.”—*Spect.*, March 1.

Sydney Smith was almost the only, certainly by far the best representative of the Steele and Swift class in the nineteenth century. The class we mean is composed of men of genius whose social and literary reputations mutually support each other—whose writings are more valued because their readiness in conversation shows that their thoughts are their own, and whose witticisms in society pass current the more readily because it is known that they can stand the test of print. Men of this class do not write big volumes; but what they do give to the world is full of matter, suggestive, and highly finished. They deal in general with topics of the day, but handle their subjects in such a manner as to impart to them a general interest and lasting freshness. They are too desultory in their habits of thought to construct systems; but they get at truth by the divining power of common sense—their remarks are sure to hit the right nail on the head. Their interest in politics is intermittent; they are incapable of sustaining the rôle of practical politicians; but they do like to throw in a word of advice, and their

advice is generally worth listening to. They are in everything hybrids between the man of thought and the man of action; and a very pleasing mixture they are.

The great secret of Sydney Smith's success was that he knew his place. He had taken a just measure of his own powers, and did not aspire to be anything else than he was. He was quite aware that he could suggest to public men views which they might have overlooked—that he could express their views in a better and more taking manner than they could—that there was a charm in his compositions and conversation to make them run after. He felt that he could make himself necessary, and thus secure an agreeable position in society. And he did not fall into poor Swift's mistake, who, with pretty similar claims imagined he could be master and dictator of those active spirits to whom he was only competent to be an indispensable auxiliary. Sydney Smith was aware that he could not become a Brougham, or even a Lord John Russell: but he felt that he knew them both thoroughly; and on their parts they had a rather uneasy consciousness of the same kind. To this tact and self-knowledge Sydney Smith added the advantage of being older than the colleagues with whom he started in life, and of having from his education at an English University something less of the provincial. They believed that he knew more of the world, and was less liable than themselves to be carried away by mere impulse or one-side knowledge; and the ascendancy he had at the outset he maintained to the end. This gave him an authority in their conclaves, confirmed by that strength of character which passed through the intoxicating experience of a fashionable preacher in the metropolis and a favorite of the salons without having his head turned. To all these circumstances he owed that he was an independent power even in the Dom-Daniel of Holland House. The few frequenters of that circle who were strong in conscious power, and they who enjoyed the hour without reflection, could relish Sydney Smith: but the innumerable shams who must always compose the bulk of such a coterie, feared while they were proud of him. He was one of those awkward allies who are not always easily managed, and with whom men dare not break.

Much of the charm of Sydney Smith's writings lay in the manner; but the matter was still more valuable. His views, if not strictly original, were in his day uncommon; and he had made them his own. He did not merely repeat what discoverers told him; he saw himself what they pointed out, and in his own way. He wrote only about what he thoroughly understood: he was master of his subject, not mastered by it. He was thus enabled to play with his theme—to insinuate truths playfully, from the severe enunciation of which the public mind would have shrunk. A suggestive fancy, and rare patience of elaboration, came to the aid of this self-possessed disposition. But this talent was always regulated by good sense, and kept in subordination by earnestness of purpose. Even in his wildest license of burlesque he never transgressed the limits of good taste, and there was always meaning and a useful aim in his jokes.

Few have pioneered so effectually the cause of reform in education, the law, and our political institutions; and of all the leaders of liberal opinion, he alone, perhaps, never stooped to coquet or compromise with the vulgar and mawkish cant of Exeter Hall.

Without that enthusiasm, which if it prompts self-sacrifice is unrelenting in its exaction of similar sacrifices from others, Sydney Smith was throughout life kind and disinterested. It has been insinuated that his only two prominent appearances of late years were dictated by selfish motives. This is unjust. In the case of the Canons Residuary he raised his voice less for Sydney Smith than for one of those classes whose individual hardships are too apt to be disregarded in sweeping or bungling measures of reform. His identity of position enabled him to enter thoroughly into their feelings; but it was more their feelings than his own to which he gave utterance. In the case of the Philadelphia Repudiation there can be little doubt that the pleasure of lashing the swindlers amply repaid him for the loss that roused him to the exertion.

We hear less of Sydney Smith's writings than formerly. Other topics of the day have superseded those about which he wrote. His writings have been relegated from the club and coffee-room to the library; and age has not yet winnowed away the chaff of contemporary scribblers amid which his wheat is deposited. But his time is coming again. His broad and genial humor, his reality, his shrewd appreciation of character, will insure his Sibley line leaves a share in the immortality of the Montaignes and Steeles of past generations.—*Spectator*.

THE UNITED STATES.

THE house of representatives have declared in favor of annexing Texas and organizing a territorial government in Oregon; and they have received petitions from Michigan and Maine praying for the annexation of Canada! The government of Texas disclaims all desire to be incorporated into the union; the bill for organizing a government in Oregon is a violation of an existing treaty with England; and the Canadas certainly have evinced no wish to fraternize. The spirit that animates the house of representatives is a lust of domination, as precipitate and insatiable as that of any crowned tyrants, the butts of American oratory.

The rational and honest portion of the U. S. citizens endeavor to reassure other countries by protesting that the senate never will adopt such measures. Let us hope so; matters are already bad enough when one of the three coördinate branches of the legislature can violate decorum and respect for the rights of other nations to the extent of passing the Texas and Oregon bills. But how long can the senate persevere in resistance to these annually-repeated assaults on its virtue? It stands between two fires; the president is as friendly to the acquisitive line of policy as the house of representatives; and both are urged on by popular feeling. The house of representatives is goaded by petitions for annexation and appropriation; General Jackson publishes oracles, that if Texas be not acquired peaceably now, it must be hereafter by the sword; and even Mr. John Quincy Adams tells stories about pattern young Americans, looking on the St. Lawrence and exclaiming, "It is and must be ours!" The senate is elective as well as the other branches of the legislature; for how long can the honest Americans guarantee to England, Texas, and Mexico, (California being already eyed wistfully by the annexers,) that the senators who stem the

torrent of national cupidity will be allowed to retain their seats!

The hardest task of the respectable class of Americans, of late years, has been to apologize for their government. The government wished to abolish slavery; the government wished to preserve national faith inviolate; the government highly disapproved of the conduct of the New York sympathizers; but the government was checkmated in all its attempts to redress those wrongs, by "States rights." Foreigners and negroes are not the only parties for whom the United States Government is too weak to procure justice. In North Carolina there is a law that every sailor of color in a foreign vessel shall be kept locked up until his vessel departs; under this law, free black citizens of Massachusetts have been repeatedly deprived of their liberty; the Government of Massachusetts lately sent an agent to remonstrate against this conduct of the Carolinian authorities—the envoy, and (apparently) his daughter also, were only saved from the American accolade of tarring and feathering, by the gentle compulsion of some gentlemen who conveyed them on board ship and obliged them to set sail.

Respectable citizens wish their government to be thought the best-disposed and most honorable in the world; but, unfortunately, it lacks power to give effect to its good intentions. It can only sigh over the excesses of its subjects, (we beg pardon—"citizens,") not prevent, check, or punish them. Do the Americans fancy that other nations will always be put off with these whining protestations of weakness and regret? that injured, insulted, and sufficiently powerful European states, will not some day take in hand to punish those who are too strong for their own government? Do they fancy that when other nations see their government not only tolerating the outrages of the worst class of citizens, but carrying into act its dishonest mandates, suspicions of complicity will not be awakened?

In the United States are to be found individuals and classes as honorable, as intelligent, as in any country in the world. Amid all the obliquities of other departments, the bench of the United States has maintained its character untarnished. The officers of the army and navy are, as a body, gentlemen, in the strictest acceptation of the word. The educated clergymen of the union are, in general, men of integrity, and set an excellent example. But, year after year, these classes appear to be losing their hold upon the executive and the legislature. It is not merely that these are now, as they ever have been, forced to give way before mobs, and content themselves with repairing the damage as they best might after the mischief has been done. They are worsted at every election; the degrading sentiments of the mere rabble are unblushingly avowed in their legislatures. The constitution of the United States seems on the eve of changing from a democracy—for *demos* elevates the whole people—to a *kakocracy*.—*Spectator*, 1 Mar.

ARMED SUPPRESSION OF THE SLAVE-TRADE.

SEEING clearly the mote that is in our brother's eye, let us not neglect a considerable speck in our

own. By what right do we authoritatively interpose to regulate under penal laws the conduct of foreigners? What right has one nation to interfere with the citizens of another, except for its own protection? Admit that we have a right to enforce our moral convictions *vi et armis* on alien nations, and we acknowledge the right of Rome, if she can, to impose Popery on us—of Islam to introduce the Koran and polygamy. We arrogate the right to meddle with the citizen of the United States in such way that one state of the union dares not pretend to act towards another—in such mode as that encroachment which now causes war between the sovereign states of the Swiss Confederation. Observe, if we speak only of moral conviction and free consent, we must negotiate without cannon at our backs, without diplomatic reserves, or custom-house bribes. The custom-house bribes are out of place, because we do not seek to purchase a benefit conceded to ourselves, but to dictate what another government shall do to its own subjects, according to our code. Our claim is a monstrous violation of sovereignty, to which nothing but meanness or cowardice will induce any foreign country to submit.

The limits of our just interference are very clear; they are the limits of our ordinary jurisdiction—territory and allegiance. If we have come to certain conclusions as to what is crime, we have a perfect right to enforce the rule within our own territory and upon our own subjects. Let us abolish slavery, if we will, and show, if we can, that it is not only virtuous, but prudent, safe, and profitable to do so. Do not let us burden our servants with the duty of enforcing English laws on Spaniards, Portuguese, French, and Americans, all along the coasts of Africa and America. Such an enterprise would be clearly impracticable and silly; it *has* failed for half a century. Limit the police-restraint to our own jurisdiction and territory. Let it be piracy for an Englishman to engage in the slave-trade, and few Englishmen will run the risk of death or perpetual exile for any share of profit. Above all, enforce the law, fully and without qualification, that every man standing on soil owned by Britain is a freeman; admit no qualification to that rule; grant that it may cause you to harbor a few runaway criminals, but say, that so long as a nation consents to own slaves and makes freedom a crime, you will not venture to discriminate between the culprit and the innocent fugitive at the suit of the slave-owning state; do all that, and you do all within your jurisdiction to secure personal freedom. That done, let your colonists compete to their hearts' content with slave-traders in obtaining labor from Africa. There is no chance that under cover of such migration a slave-trade would arise; for as you refuse to recognize any bond—as you begin by regarding every man as a freeman, and acknowledge no obligation except such as he may incur *after* your recognition of his liberty—you would frustrate the whole end and aim of slave-trading. You make the transfer of the slave from dealer to purchaser impossible. Slave-traders deal in slaves, not in freemen; could you convert the cargo of a Baltimore clipper, on landing, into so many Yankee citizens defying ownership, you would have very few Baltimore shippers investing money in that trade.—*Spectator*, 1 Mar.

PUNCH.

ECONOMICAL LUXURIES.—From recent accounts, if it be true that mesmerism can convert water into beer or wine, and can work changes in the gastronomic way that Bradwell, Döbler, and Time, were they to put three heads together, never could invent; why not then apply this new science of cheap cookery to the improvement of workhouse larders! Only consider the saving to each parish in the poor's rates, if the paupers were to imagine the New River Moët's champagne, paving-stones leaves of bread, and deal-boards haunches of venison! The same legerdemain might be practised on everything that passed their mouths; and the paupers, whilst they would fare at less cost, if possible, than at present, would have the mental enjoyment of imagining they had been dining off luxuries hitherto the abdominal perquisites of aldermen. Every Union will become an Arcadia, stocked with venison and currant-jelly, and poverty be a thing only to be met with in works of fiction! The Millennium, by the aid of magnetism, will be brought to every man's door; and the pot will be kept boiling all through the world by means of the electric fluid.

NEW TITLES OF HONOR.—It is stated to be the intension of her majesty's advisers, in emulation of the titles common in Spain, such as "Duke of Victory," "Viscount of Loyalty," (recently conferred on the Baron de Meer,) &c., to institute a new set of dignities, taking their denominations from the qualities most distinguishing the intended recipients. Thus, a noble ex-chancellor is to be created "Viscount of Vinegar;" Mr. O'Connell, "Viscount of Vituperation;" and Sirs R. Peel and J. Graham, (from the epistolary perfection of the one, and the deciphering capabilities of the other,) respectively, "Lord Letterwriting," and "Lord Letterreading." Nor are the new titles to be confined to the political world; Lord W. Lennox, we understand, is to be raised to the peerage by the style of "Viscount Scissors, of Sheffield;" and the celebrated Mr. Grant, "Earl of English Grammar," Mr. Bunn, the poet, is to be "Baron of Blazes;" and the chivalrous Mr. Widdieombe will have the appropriate title of "Marquis Methusalem." However unusual it may be to ennoble a Lord Mayor, or other city dignitary, we also hear that, in consideration of his distinguished merit, the present occupant of that honorable office is likely to become "Baron Brass."

PUNCH'S NOY'S MAXIMS.

OF GRAMMAR.—For ages the law has regarded Grammar as a guest at a dinner-party regards champagne, taking it when it happens to be there, but never insisting on having it. "It has been settled," says an old jurist, "that Alfred the Great lived before Lindley Murray, and as Alfred made a very good code of laws without the aid of Orthography, Etymology, Syntax, or Prosody, it does not seem that the law absolutely requires any one of them." Lycurgus, the Spartan lawgiver, was no great grammarian; but it was facetiously said of him that he could decline though he would never conjugate; for he declined his brother's widow, and refused to enter into the conjugal state with her. The only law maxim bearing on grammar, is—

3. *Ad proximum antecedens fiat relatio, nisi im-*

pediatur sententia—The antecedent bears relation to what follows next, unless it interferes with the meaning of the sentence.

An indictment against John, the husband of Elizabeth Yeoman, is good; for though Lindley Murray would say the yeoman meant Elizabeth, the law would say that a woman can't be a man, and that John, the husband, must be considered as the Yeoman referred to. So, in the case of the actor who burst in upon Richard the Third, exclaiming, "My lord, 't is I, the early village cock," and forgot the remainder of the passage—it is clear he could not have been sued as the early village cock; for such a description, though grammatically correct, would have been at variance with all probability.

OR LOGIC.—4. *Cessante causa cessat effectus*—When the cause ceases, the effect ceases. This maxim may be read either backwards or forwards; for if it be true that when the cause ceases the effect ceases, it is, *à fortiori*, a greater truth that when the effects cease the cause will cease; for the lawyer, when he finds the effects all gone, will let the cause come to a stand-still.

Though it is a general rule that effects cease with causes, there are cases to the contrary. And the books tell us of a man who had a thrashing which caused him much pain, and the pain which was the effect did not cease when the thrashing, which was the cause, had been for a long time over.

5. *Some things shall be construed according to the original cause thereof.*—Thus, if two men have a quarrel, and some long time afterwards fight, it is presumed they fought because they quarrelled; but in the Irish courts, and some of the courts about St. Giles', it has been decided otherwise. It has been there held that fighting may be carried on from mere love and affection, and the fight is quite independent of any quarrel that may have preceded it.

6. *Some things shall be construed according to the beginning thereof.*—Thus, if J. S. throws a stone at J. D., and misses him, and J. D. runs after J. S. to thrash him, and J. S. is beforehand and knocks him down, J. S. is guilty of the assault, for he began by throwing the stone; and J. D. stands in the best position in the eye of the law, though in other respects he has got rather the worst of it.

7. *Some things are construed according to the end thereof.*—Thus, a brilliant finale may save a dull opera, and a prosy speaker makes us feel satisfied with him at the end because we are pleased to find his speech is over.

8. *Derivativa protestas non potest esse major primitivis*—No power derived can be greater than that it is derived from. The application of this maxim is clear enough: for instance, "the bailiff of the disseisor shall not say that the plaintiff has nothing in the land," which is a nut that the legal student may crack at his earliest convenience. There are, however, cases in which a derivative power is greater than that from which it is derived; "as where a ticket-porter," says Finch, "is empowered by me to carry a chest of drawers on the top of his head, surely his power is greater than mine in this respect." Howells, in his familiar letters, alludes to this as a knotty point, and makes no attempt to unravel it.

9. *Quod ab initio non valet, in tractu temporis non convalescit*—That which is not good in the beginning no length of time can make good.

Thus, if an infant makes a will it is bad, and if the infant lives to be a hundred the will does not become good, though it is otherwise with port wine, which improves by keeping. So a bad toothache may get better; though some, acting on the maxim that what is bad in the beginning will not become good in time, have served the tooth with an ejection, and ousted it accordingly. The old saying, that "bad beginnings make good endings," is quite at variance with the maxim we have just been treating of. Perhaps the best translation of this maxim is one which we find nowhere in the books, but which we beg to recommend to the attention of harsh creditors—*Quod ab initio non valet, Quod is of no use in the beginning; in tractu temporis non convalescit*, and for a length of time it is of no use either.

10. *Unumquodque dissolvitur eo modo quo colligatur*—Everything is dissolved by the same mode in which it is bound together.—In reading this maxim we involuntarily exclaim, "Oh law!" for nothing but law would venture on such a bold assertion as the above, which is almost enough to call a blush into our modest pen, by turning red the ink we are writing with. If the maxim were true, that everything is dissolved by the mode in which it is bound together, ice would be dissolved by freezing, and a hard-boiled egg would be rendered soft by again boiling it. What is palpably false may, however, be legally true, and the maxim is good law though it is very bad morality. Thus an obligation in writing cannot be discharged by mere words—as, if a man has given a bill, all the talking in the world will not take it up. And the old English maxim, that "fine words butter no parsnips" had probably reference to a written contract wherein A., after having undertaken to butter certain parsnips belonging to B., endeavored to release himself from the obligation by a little of what the American authorities usually term "soft sawder."

An act of Parliament can only be avoided by an act of Parliament; and doubtless to save trouble, Parliament frequently provides for this in one and the same act, by leaving loopholes in it, which render it easily voidable.

11. *He who claims a thing by a superior title shall neither gain nor lose by it.*—"Though," says Knight Bruce, "if a purchaser claims from his wine-merchant a dozen of champagne, and gets gooseberry, thus in fact claiming the gooseberry by the superior title of champagne, he does both gain and lose; for he gains experience, and loses the value of his money." In the old editions of Noy, we are told in illustration of this maxim, that "If an executor recovers and dies intestate, and J. S. administers to the goods of the first testator, J. S. shall not sue out execution upon this recovery." The only difficulty about this case appears to be how the executor happened to die, when we are distinctly told that he recovered.

12. *Debile fundamentum fallit opus*—A weak foundation destroys the superstructure.—Thus, a very seedy coat will ruin the effect of a new hat, and a horse will inevitably break down if he has not a leg to stand upon. If he who claims the freehold is defeated, all his tenants are defeated also, because the foundation is gone: and so, if the parlors (occupied by the landlord) should tumble in, the floors above (let out in lodgings) would be sure to follow.

13. *Incidents cannot be severed.*—This maxim means that anything incidental to something else

cannot in law be taken from it; but an incidental ballet is sometimes left out of a piece, and the incidents in a melo-drama may often be severed, for they frequently have no connection one with the other.

14. *Actio personalis moritur cum persona*—A personal action dies with the person.—This maxim is clear enough, and means that an action brought against a man who dies in the middle of it cannot be continued. Thus, though the law will sometimes pursue a man to the grave, his rest is not there liable to be disturbed by the lawyers. If a soldier dies in action, the action does not necessarily cease, but is often continued with considerable vigor afterwards.

15. *Things of a higher nature determine things of a lower nature.*—Thus a written agreement determines one in words, though if the words are of a very high nature they put an end to all kinds of agreement between the parties.

16. *Majus continet minus*—The greater contains the less.—Thus, if a man tenders more money than he ought to pay, he tenders what he owes, for the greater contains the less; but a quart wine-bottle, which is greater than a pint and a half, does not always contain a pint and a half, so that in this instance the less is not contained in the greater.

17. *Majus dignum trahit ad se minus dignum*—The more worthy draws with it the less worthy.—In accordance with this maxim, the owner of deeds has a right to the box containing them; for the box, which is less worthy, is drawn to the deeds which are the more worthy. By the same rule, that which draws the boxes will also draw the pit, and sometimes the gallery. It may be added, as a further illustration of this maxim, that champagne draws with it brandy-and-water at a later period of the evening; and thus the more worthy—the champagne—draws the less worthy—the brandy-and-water—after it.

18. *Nature vis maxima*—The force of nature is the greatest.—This maxim means that no power is greater than natural affection; but the power of the steam-engine was unknown when the maxim was written. Parental affection approaches nearer to steam; for a father frequently blows up his child, and in some cases a good deal of the affection of the former has been known to evaporate.

19. *The law favoreth some persons.*—The reader will no doubt think that Noy was in a merry mood when he talked of the law favoring any one but the lawyers themselves, though when it is ascertained who the favorites of the law really are, the maxim is not quite so enigmatical. The favored individuals are women, infants, idiots, madmen, and persons without intelligence, who being all of them helpless, may be supposed to fall an easy prey to the law, and are therefore its favorites; in the same sense as the sparrow is the favorite of the hawk, or as the lamb is the especial pet of the wolf, when the parties happen to come in contact. The doctrine of tit-bits offers a wide scope for discussion; but it may be laid down as a general rule, that where the law gets hold of an idiot with property, it will favor him in one sense—for it will make much of him. The gallantry of the law in classing women and lunatics together may be questionable; but this is a point we leave the lawyers and the ladies to settle between them.

20. *The law favoreth a man's person before his*

possession.—This is true enough; for the law will not spare a man's property, though it will often leave his person unmolested. Thus, the law will not lay hands on an idiot's person, even for felony, but it will lay hands on his property, by taking the earliest opportunity of clutching hold of it.

21. *The law favoureth matter of possession more than matter of right, when the right is equal.*—Thus, if two persons were to knock a man down with the intention of robbing him, the law would, according to the above maxim, favor the thief who managed to get possession of the property. "This," says Spelman, "is the doctrine of first come first served; for if six people sit down to dine on a chicken, it is clear that they cannot all take; but he that is first seized, or rather seizes first, will be entitled, though the right of all was in the first instance equal." In the above case the remainder-man has no relief, even though there may have been covin, for he has only a contingent interest, which the estate—or chicken—may not be large enough to satisfy.

22. *Matter of profit or interest shall be taken largely, and it may be assigned, but it cannot be countermanded. But matter of pleasure, trust, or authority, shall be taken strictly, and may be countermanded.*—This maxim is somewhat long, or, as Coke would say, it goes great lengths: for when it says matter of profit should be taken largely, it seems to hit at the law itself, which does certainly take as largely as it can any matter with profit attached to it. If I allow a man to walk in my park, he cannot bring any one else to walk with him, for it is merely a matter of pleasure; but if I allow him to come to play at leapfrog in my yard, it is doubtful whether he could not bring a few friends, for no man can play at leapfrog by himself, and the permission should include everything necessary to the full enjoyment of it.

A license to come into my house to speak with me may be countermanded, for, if the party takes too much license and becomes impertinent, I may show him the door: as in Smith's case, where Smith was asked in, but beginning to dun for his small account, the license to speak with me was revoked, and Smith, growing rude, was sent flying (*vide* SHOWER) down the hall-steps, till he became tenant in tail of the pavement.

CHURCH THIEVES.—Thieves are, now-a-days, such prosaic rascals, that their doings have ceased to interest us. Perhaps it is that the graces of modern fiction have so elevated and set-off the burglar and the highwayman, that we are disappointed with the blank vulgarity of the real thing. It is like seeing a Coburg *Richard*, reduced to a Tweed-wrapper and a cotton umbrella, picking his way along the New Cut. We were, therefore, somewhat tickled by an epistle, sent, on the 22d ult., by some sacrilegious knave, to the Rev. Mr. Dee, of St. Thomas', Southwark. Some months back, the church was robbed of its communion-plate. One of the thieves, however, treats for its restoration. We extract from his homely epistle:—

"Reverd Sir,—The reward as is offred is not enuff for the plate removed from the church as the expenses as been very heavy and the anxiety if you are disposed to make it fifty pounds to be divided amongst us it may be restord as *this is the first time have had to do with a church.*"

Now, of the "expense" of breaking into a church we have not the remotest idea. We presume, however, that it must be a costly operation. We particularly admire the word "removed:" there is a fine delicacy in the phrase that is quite diplomatic. It is quite a touch for a prime minister or an ambassador, and here we find it pressed into the service of a half-repentant gallows-bird. "Removed" is a good phrase. It was thus Napoleon "removed" pictures from churches; it was thus he "removed" the Horses of St. Mark to the gate of the Tuileries. The thief of St. Thomas', however, betrays symptoms of pusillanimity that never disgraced the imperial robber. Our knave hints of "the anxiety" that has followed the transaction. It is clear there is a tender place in his conscience, as he plainly enough states that "it is the first time" he has had "to do with a church." Ha, this is it! He is but "young in crime." Had he only "removed" as many valuables from churches as certain French marshals, he would have shared with them their heroic freedom from all "anxiety" about the matter. To be sure the world, in its lamentable ignorance, entertains a different notion of the robber and the hero. To be able to lay hands upon church valuables by means of crow-bar, pick-axe, and lantern, is sacrilegious infamy—to take down pictures and carry off church-plate with beating drums and flying colors—that is a part and parcel of glory; one of the lawful sweets of soldiering. One act is rewarded with a rope, the other with a garland.

WAKLEY'S ADDRESS TO HIS PROFESSION.

Ye who have for Science bled,
Ye whom WAKLEY oft has led,
Who by Medicine earn your bread,
Or by Surgery :

Now 's the day and now 's the hour,
Don't you find your prospects low'r?
See approach gross Humbug's power;
GRAHAM and Quackery!

Who would be so green and base,
As to PARR to yield his case;
Or to HOLLOWAY give place!
Let his patients flee.

Who 's for Medicine's rights and claims?
Who will vote against SIR JAMES!
Who would "burke" that bill of GRAHAM's?
Large his practice be.

Down with our Profession's foe!
Tooth and nail against him go;
Quacks are floored at every blow,
At him, then, with me!

Carte d'un Restaurant. Londres, 1845.

The volume now before us, mentally speaking, is, in plain English, the bill of fare at a celebrated French eating-house at the West End, at which we dined the other day. We have no disposition to quarrel either with the contents of this book, or the matters which they relate to; but there is a certain addition which, we would suggest, might, and ought to be made to them. They require notes. It is true that opposite to the French list of dishes there is an English parallel; but this, in many instances, is no translation at all: and, even if it were, would be useless. What, for instance,

is the ordinary eater to understand by "*Côtelettes à la jardinière*,"—chops after the manner of the she-gardener. How is he to know the peculiarities of the she-gardener's chops? Among other items in this work there is an "*Épigramme d'agneau*;" but this, luckily, is translated, "breast of lamb;" otherwise it might be difficult to know whether the epigram was food for the mind or the body. Another dish is, "*Rognons sautés au vin de Champagne*"—kidneys stewed in Champagne; still great obscurity hangs over this stew. But what startled us most, was a viand called "*Charlotte Russe aux fraises*." "*Charlotte Russe!*" we exclaimed; "*Russian Charlotte*," "*aux fraises*," "*with strawberries!*" What dish is this?—Are we amongst cannibals, who, with her strawberries, will have us eat the strawberry girl? To know merely the English of these titles is unavailing; they are like portions of certain Greek choral odes, which we can translate, but cannot comprehend their translation. Let a full description of each dish be given in the margin, or at the foot of the page. At present we defy even a Templar to understand this book, unless he has eaten at least his three years' terms at Paris.

MR. CAUDLE HAS REMAINED DOWN STAIRS TILL PAST ONE, WITH A FRIEND.

A pretty time of night to come to bed, Mr. Caudle. Ugh! As cold, too, as any ice. Enough to give any woman her death, I'm sure. What! I should n't have locked up the coals, indeed! If I had n't, I've no doubt the fellow would have staid all night. It's all very well for you, Mr. Caudle, to bring people home—but I wish you'd think first what's for supper. That beautiful leg of pork would have served for our dinner to-morrow—and now it's gone. I can't keep the house upon the money, and I won't pretend to do it, if you bring a mob of people every night to clear the cupboard.

"I wonder who'll be so ready to give you a supper when you want one; for want one you will, unless you change your plans. Don't tell me! I know I'm right. You'll first be eaten up, and then you'll be laughed at. I know the world. No, indeed, Mr. Caudle, I don't think ill of everybody; don't say that. But I can't see a leg of pork eaten up in that way, without asking myself what it's all to end in if such things go on! And then he must have pickles, too! Could n't be content with my cabbage—no, Mr. Caudle, I won't let you go to sleep. It's very well for you to say let you go to sleep, after you've kept me awake till this time. Why did I keep awake! How do you suppose I could go to sleep, when I knew that man was below drinking up your substance in brandy-and-water! for he could n't be content upon decent, wholesome gin. Upon my word, you ought to be a rich man, Mr. Caudle. You have such very fine friends. I wonder who gives you brandy when you go out!

"No, indeed, he could n't be content with my pickled cabbage—and I should like to know who makes better—but he must have walnuts. And you, too, like a fool—now, don't you think to stop me, Mr. Caudle; a poor woman may be trampled to death, and never say a word—you, too, like a fool—I wonder who'd do it for you—to insist upon the girl going out for pickled walnuts. And in such a night too! With snow upon the ground. Yes; you're a man of fine feelings, you are,

Mr. Caudle! but the world does n't know you as I know you—fine feelings, indeed! to send the poor girl out, when I told you and told your friend, too—a pretty brute he is, I'm sure—that the poor girl had got a cold and chilblains on her toes. But I know what will be the end of that; she'll be laid up, and we shall have a nice doctor's bill. And you'll pay it, I can tell you—for I won't.

"Wish you were out of the world! Oh! yes, that's all very easy, I'm sure I might wish it. Don't swear in that dreadful way! Ain't you afraid that the bed will open and swallow you! And don't swing about in that way. That will do no good. That won't bring back the leg of pork—and the brandy you've poured down both of your throats. Oh, I know it! I'm sure of it. I only recollected it when I'd got into bed—and if it had n't been so cold, you'd have seen me down stairs again, I can tell you—I recollected it, and a pretty two hours I've passed, that I left the key in the cupboard—and I knew it—I could see by the manner of you, when you came into the room—I know you've got at the other bottle. However, there's one comfort; you told me to send for the best brandy—the very best—for your other friend, who called last Wednesday. Ha! ha! It was British—the cheapest British—and nice and ill I hope the pair of you will be to-morrow."

"There's only the bare bone of the leg of pork: but you'll get nothing else for dinner, I can tell you. It's a dreadful thing that the poor children should go without—but, if they have such a father, they, poor things, must suffer for it.

"Nearly a whole leg of pork and a pint of brandy! A pint of brandy and a leg of pork. A leg of—leg—leg—pint—"

And mumbling the syllables, says Mr. Caudle's MS., she went to sleep.

THE THIRD CLASS TRAVELLER'S PETITION.

Pity the sorrows of a third class man,
Whose trembling limbs with snow are whitened
o'er,
Who for his fare has paid you all he can:
Cover him in, and let him freeze no more!

This dripping hat my roofless pen bespeaks,
So does the puddle reaching to my knees;
Behold my pinch'd red nose—my shrivell'd cheeks:
You should not have such carriages as these.

In vain I stamp to warm my aching feet,
I only paddle in a pool of slush;
My stiffen'd hands in vain I blow and beat;
Tears from my eyes congealing as they gush.

Keen blows the wind; the sleet comes pelting
down,
And here I'm standing in the open air!
Long is my dreary journey up to Town,
That is, alive, if ever I get there.

Oh! from the weather, when it snows and rains,
You might as well, at least, defend the poor;
It would not cost you much, with all your gains:
Cover us in, and luck attend your store.

BATHS FOR THE POOR.

We understand that some of the Railway Companies, desirous of carrying out the project for

supplying the poor with baths, have had their third-class carriages constructed so as to serve the double purpose of a locomotive and a washing-tub. They are supplied with water from the rain, which pours in upon all sides; and enough to constitute a bath is provided in a very few minutes, if the weather happens to be favorable to the benevolent object.

THE NEW TARIFF.

By the new Customs resolutions 430 articles are to be henceforth duty free. This sounds exceedingly well, but when we ask the child's question, whether Sir R. Peel's boon comprises "anything good to eat," we are bitterly disappointed at the reply which the list presents to us.

Among the articles that may henceforth be had cheap, there are at least half, that we, in our innocence, never heard of. The second thing upon the list is *Algnobilla*, which we shall be glad if any of our correspondents will favor us with a bit of—or a drop of—as the case may be, that we may ascertain how far the public will be likely to benefit by its coming in free of duty. The first really intelligible article we come to is *Arsenic*, of which there is already more than enough in this country; but as arsenic seems to be all the rage, the premier perhaps thought a spice of it would be well-timed at the present moment.

Beef-wood is a promising title, but we fear that beef-steaks, even as hard as a board, will not be let in free by the abandonment of the duty on beef-wood. If we cannot have the meat, however, we may be allowed the bones, for these are to be henceforth untaxed; and as the hoofs of cattle are also to be let in, an attempt may be made to get calf's-foot jelly for the million out of them.

Canella Alba, *Cinnabaris Nativa*, and *Divi Divi*, are also to come in duty free: but if we were to see a lot of stuff in a window, marked "*Divi Divi*," two-pence a pound, or a placard inscribed "New Tariff, the duty off *Cinnabaris Nativa*," we should be puzzled to know what to make of it. *Fustic* and *Ginseng* will doubtless be a boon to those who are fond of such things, though we confess we should not like to venture to take any; while our objections to *Eupherbium* and *Tragacanth* are equally insuperable.

The premier is particularly favorable to the poisoning interests, for he releases *Hellebore* as well as *Arsenic*; and *Ipecacuanha*, *Senna*, and *Jalap*, will also be let in: so that Sir R. Peel may exclaim literally, "Here's medicine for thy grief," when the poor man asks what the tariff will do for him.

We are to have iron in the pig, but whether a live pig with a ring run through his nose will be let in is doubtful. The leaves of roses are also to come in free; but perhaps there is some selfishness in this, for the premier would no doubt like to have a bed of them. Our eye was caught by the words, *goose undressed*; but on looking further we found it is the skin only of the foolish bird that we are to be treated to exempt from duty. In conclusion, we defy the most ingenious cook to hash up a dinner out of the whole 430 articles.

After exercising our culinary sagacity to the utmost extent, we find that the following is the best bill of fare we could make up from the list before us:—

FISH.—Whale fins of British taking.

SOUP.—Ox-tail, tanned, but not otherwise dressed.

GAME.—Singing birds.

MEATS.—Beef-wood, hoofs of cattle, lamb (skins,) dyed or colored, dressed in oil.

ENTREES.—Fricasseeed racoon, tiger en papillote.

PASTRY.—Sweet wood

CHEESE.—Bees'-wax.

DESSERT.—Nuts, kernels of walnuts, and of peach stones.

WINES AND LIQUEURS.—Antimony wine, senna, sanguis draconis, &c. &c.

The above is the best possible dinner that could be given under the New Tariff.

THE IMAGINATIVE CRISIS.

Oh! solitude, thou wonder-working fay,
Come, nurse my feeble fancy in your arms,
Though I and thee and fancy town-pent lay,
Come, call around a world of country charms,
Let all this room, these walls, dissolve away,
And bring me Surrey's fields to take their place;
This floor be grass, and draughts as breezes play;
Yon curtains trees, to wave in summer's face;
My ceiling, sky; my water-jug, a stream;
My bed, a bank, on which to muse and dream.
The spell is wrought: imagination swells
My sleeping-room to hills, and woods, and dells!
I walk abroad, for nought my footsteps hinder;
And fling my arms. Oh! mi! I've broke the
winder.

THE POPE.

The Pope he leads a happy life,
No contradiction knows, nor strife;
He rules the roast by right divine,
I would the Papal chair were mine!
But happy, now, I fear he's not,
Those Irish are a noisy lot;
And as with Dan he has to cope,
I think I'd rather not be Pope.

O'Connell better pleases me,
With all he will he maketh free;
He raises *rint* with wondrous skill;
Like him my pockets I would fill.
But even he, the great king Dan,
Is forced to sink the gentleman,
And bluster where repealers dine;
I would not change his lot for mine.

So here I'll take my lowly stand,
In what is called "this favored land;"
Put up with strife, if need be mine,
Nor at an empty purse repine.
But when my pocket's filled, with glee,
I'll dream that I O'Connell be;
And when their mouths repealers ope,
I'll thank my stars I'm not the Pope.

From Jerrold's Magazine.

CHAPTER V.

SHORT was the distance from Covent Garden Theatre to Covent Garden watch-house; and therefore in a few minutes was young St. Giles arraigned before the night-constable. Cesar Gum had followed the offender as an important witness against him; whilst Bright Jem and his wife certainly attended as sorrowing friends of the prisoner. Kitty Muggs was of the party; and her indignation at the wrong committed "on so blessed a baby"—we mean of course St. James—would have burst forth in loudest utterance had she not been controlled by the moral influence of Bright Jem. Hence, she had only the small satisfaction of declaring, in a low voice to her sister, "that the little wretch would be sure to be hanged—for he had the gibbet, every bit of it, in his countenance." With this consolation, she suffered herself to be somewhat tranquillized. "The Lord help him!" cried Mrs. Aniseed. "Well, you ought to be ashamed of yourself to say such a thing!" whispered Kitty Muggs.

Bright Jem was sad and silent. As Cesar, with unusual glibness, narrated the capture of the prisoner with the stolen property upon him, poor Jem, shading his eyes with his hand, looked mournfully at the pigmy culprit. Not a word did Jem utter; but the heart-ache spoke in his face.

"And what have you got to say to this?" asked the night-constable of St. Giles. "You're a young gallows-bird, you are; hardly out of the shell, yet. What have you got to say?"

"Why, I did n't take the at," answered young St. Giles, fixing his sharp black eyes full on the face of his interrogator, and speaking as though he repeated an old familiar lesson, "I did n't take it: the at rolled to me; and I thought as it had tumbled out of a coach as was going on, and I run after it, and calling out, if nobody had lost a at, when that black gentleman there laid hold on me, and said as how I stole it. How could I help it, if the at would roll to me! I did n't want the at."

"Ha!" said the constable, "there's a good deal of wickedness crammed into that little skin of yours—I shall lock you up. There—go in with you," and the constable pointed to a cell, the door of which was already opened for the reception of the prisoner.

And did young St. Giles quail or whimper at his prison threshold? Did his young heart sink at the gloomy dungeon! Oh no. Child as he was, it was plain he felt that he was acting a part: he had become in some way important, and he seemed resolved to rise with the occasion. He had listened to tales of felon fortitude, of gallows heroism; and ambition stirred within him. He had heard of the Tyburn humorist, who, with his miserable jest in the jaws of death, cast his shoes from the cart, to thwart an oft-told prophecy that he would die shod. All these stories St. Giles had listened to, and took to his heart as precious recollections. While other children had conned their books—and written maxim copies—and learned their catechism—St. Giles had learned this one thing—to be "game." His world—the world of Hog Lane had taught him that; he had listened to the counsel from lips with the bloom of Newgate on them. The foot-pad, the pickpocket, the burglar, had been his teachers: they had set

him copies, and he had written them in his brain for life-long wisdom. Other little boys had been taught to "love their neighbor as themselves." Now, the prime ruling lesson set to young St. Giles was "honor among thieves." Other boys might show rewarding medals—precious testimony of their schooltime work; young St. Giles knew nothing of these; had never heard of them; and yet unconsciously he showed that to him was best evidence of his worth: at the door of his cell, he showed that he was "game." Scarcely was he bidden to enter the dungeon, than he turned his face up to the constable, and his eyes twinkling and leering, and his little mouth quivering with scorn, he said—"You don't mean it, Mister; I know you don't mean it."

"Come, in with you, ragged and sarcy!" cried the constable.

"Well, then," said the urchin, "here goes—good night to you," and so saying, he flung a sunset into the cell: the lock was turned, and Bright Jem—fetching a deep groan—quitted the watch-house, his wife, sobbing aloud, following him.

"What can they do to the poor child?" asked Mrs. Aniseed of Jem, as the next morning he sat silent and sorrowful, with his pipe in his mouth, looking at the fire.

"Why, Susan, that's what I was thinking of. What can they do with him? He isn't old enough to hang; but he's quite big enough to be whipped. Bridewell and whipping: yes, that's it, that's how they'll teach him. They'll make Jack Ketch his schoolmaster; and nicely he'll learn him his lesson towards Tyburn. The old story, Susan—the old story," and Jem drew a long sigh.

"Don't you think, Jem, something might be done to send him to sea? He'd get taken away from the bad people about him, and who knows, might after all turn out a bright man." Such was the hopeful faith of Mrs. Aniseed.

"Why, there's something in that to be sure. For my part, I think that's a good deal what the sea was made for—to take away the offal of the land. He might get cured at sea; if we could get anybody as would take him. I'm told the sea does wonders, sometimes, with the morals of folks. I've heard of thieves and rogues of all sorts, that were aboard ship, have come round 'straordinary. Now, whether it's in the salt water or the bo'swains, who shall say? He would n't make a bad drummer, neither, with them little quick fists of his, if we could get him in the army."

"Oh, I'd rather he was sent to sea, Jem," cried Mrs. Aniseed, "then he'd be out of harm's way."

"Oh, the army reforms all sorts of rogues, too," averred Jem. "Sometimes they get their morals pipeclayed, as well as their clothes. Wonderful what heroes are made of, sometimes. You see, I suppose, there's something in some parts of the trade that agrees with some folks. When they storm a town now, and take all they can lay their hands on, why there's all the pleasure of the robbery without any fear of the gallows. It's stealing made glorious with flags and drums. Nobody knows how that little varmint might get on."

Here Jem was interrupted by the sudden appearance of a woman hung with rags and looking prematurely old. Misery and vice were in her face, though the traces of evil were for the time

softened by sorrow. She was weeping bitterly, and with clasped trembling hands, ran into the room. It was the wretched mother of young St. Giles; the miserable woman who more than six years before had claimed her child in that room; who had borne her victim babe away to play its early part in wretchedness and deceit. She had since frequently met Jem, but always hurried from him. His reproofs, though brief, were too significant, too searching, for even her shame to encounter. "Oh, Jem! Jem!" she cried, "save my dear child—save my innocent lamb."

"Ha! and if he is n't innocent," cried Jem, "whose fault's that?"

"But he is—he is," screamed the woman. "You won't turn agin him, too! He steal anything! A precious cretur! he might be trusted with untold gold!"

"Woman," said Jem, "I would n't like to hurt you in your trouble; but have n't you no shame at all! Don't you know what a bit of truth is, that even now you should look in my face, and tell me such a wicked lie!"

"I don't, Jem—I don't," vociferated the woman. "He's as innocent as the babe unborn."

"Why, so he is, as far as he knows what's right and what's wrong. He has innocence; that is, the innocence you've taught him. Teach a child the way he should go," cried Jem, in a tone of some bitterness, "and you've taught him the way to Newgate. The Lord have mercy on you! What a sweet babby he was, when six year and a half ago you took him from this room—and what is he now! Well, well, I won't pour water on a drowned mouse," said Jem, the woman crying more vehemently at his rebuke, "but how you can look in that child's face, and arterwards look up at heaven, I don't know."

"There's no good, not a ha'porth in all this preaching. All we want to know is this. Can you help us to get the young 'un out o' trouble?" This reproof and interrogation were put in a hoarse, sawing voice by a man of about five-and-thirty, who had made his appearance shortly after St. Giles' mother. He was dressed in a coat of Newgate cut. His hat was knowingly slanted over one eyebrow, his hands were in his pockets, and at short intervals he sucked the stalk of a primrose that shone forth in strong relief from the black whiskers and week's beard surrounding it.

"And who are you?" asked Jem, in a tone not very encouraging of a gentle answer.

"That's a good 'un, not to know me. My name's Blast—Tom Blast; not ashamed of my name," said the owner, still champing the primrose.

"No, I dare say not," answered Bright Jem. "Oh, I know you now. I've seen you with the boy a singing ballads."

"I should think so. And what on it! No disgrace in that, eh? I look upon myself as respectable as any of your folks as sing at your fine play-house. What do you all pipe for but money! Only there's this difference; they gets hundreds of pounds—and I gets half-pence. A singer for money's a singer for money—whether he stands upon mud or a carpet. But all's one for that. What's to be done for the boy! I tell his mother here not to worry about it—'t wont be more than a month or two at Bridewell, for he's never been nabbed afore: but it's no use a talking to women, you know; she won't make her life happy, no how. So we've come to you."

"And what can I do?" asked Jem—"I'm not judge and jury, am I?"

"Why, you know Capstick, the muffin-man. Well, he's a householder, and can put in a good word for the boy with the beak. I suppose you know what a beak is?" said Thomas Blast, with a satirical twist of the lip. "Not too fine a gentleman to know that?"

"Why, what does Capstick know of little St. Giles?" asked Jem.

"Oh, Jem," said the woman, "yesterday he stood his friend. He's a strange cretur, that Capstick; and often does a poor soul a good turn, as if he'd eat him up all the while. Well, yesterday arternoon, what does he do but give my precious child—my innocent babe—two dozen muffins, a basket and a bell."

"I see," cried Jem, with glistening eyes, "set him up in trade. God bless that muffin-man."

"That's what he meant, Jem; but it was n't to be—it was n't to be," cried the woman with a sigh.

"No—it warn't," corroborated Mr. Blast. "You see the young un—all agog as he was—brought the muffins to the lane. Well, we had n't had two dinners, I can tell you, yesterday; so we sells the basket and the bell for sixpenn'orth of butter, and did't we go to work at the muffins." And Mr. Blast seemingly spoke with a most satisfactory recollection of the banquet.

"And if they'd have poisoned all of you, served you right," cried Jem, with a look of disgust. "You *will* kill that child—you won't give him a chance—you will kill him body and soul."

"La, Jem! how can you go on in that way!" cried the mother, and began to weep anew. "He's the apple of my eye, is that dear child."

"None the better for that, by the look of 'em," said Jem. "Howsomever, I'll go to Mr. Capstick. Mind, I don't want neither of you at my heels; what I'll do—I'll do by myself," and without another word, Bright Jem took his cap, and unceremoniously passing his visitors, quitted the room. His wife, looking coldly at the newcomers, intimated a silent wish that they would follow him. The look was lost upon Mr. Blast, for he immediately seated himself; and seizing the poker, with easiest familiarity beat about the embers. Mrs. Aniseed was a heroic woman. Nobody who looked at her, whilst her visitor rudely disturbed her coals, could fail to perceive the struggle that went on within her. There are housewives whose very heartstrings seem connected with their pokers; and Mrs. Aniseed was of them. Hence, whilst her visitor beat about the grate, it was at once a hard and delicate task for her not to spring upon him, and wrest the poker from his hand. She knew it not, but at that moment the gentle spirit of Bright Jem was working in her; subduing her aroused passion with a sense of hospitality.

"A sharp spring this, for poor people, is n't it, Mrs. Aniseed?" observed Mr. Blast. "It seems quite the tail of a hard winter, does n't it?" Mrs. Aniseed tried to smile a smile—she only shivered it. "Well, I must turn out, I'spose; though I have n't nothing to do till night—then I think I shall try another murder: it's a long while since we've had one."

"A matter of two months," said the mother of St. Giles, "and that turned out no great things."

"Try a murder," said Mrs. Aniseed with some apprehension, "what do you mean?"

And did young St. Giles quail or whimper at his prison threshold? Did his young heart sink at the gloomy dungeon? Oh no. Child as he was, it was plain he felt that he was acting a part: he had become in some way important, and he seemed resolved to rise with the occasion. He had listened to tales of felon fortitude, of gallows heroism; and ambition stirred within him. He had heard of the Tyburn humorist, who, with his miserable jest in the jaws of death, cast his shoes from the cart, to thwart an oft-told prophecy that he would die shod. All these stories St. Giles had listened to, and took to his heart as precious recollections. While other children had conned their books—and written maxim copies—and learned their catechism—St. Giles had learned this one thing—to be "game." His world—the world of Hog Lane had taught him that; he had listened to the counsel from lips with the bloom of Newgate on them. The foot-pad, the pickpocket, the burglar, had been his teachers: they had set

him copies, and he had written them in his brain for life-long wisdom. Other little boys had been taught to "love their neighbor as themselves." Now, the prime ruling lesson set to young St. Giles was "honor among thieves." Other boys might show rewarding medals—precious testimony of their schooltime work; young St. Giles knew nothing of these; had never heard of them; and yet unconsciously he showed what to him was best evidence of his worth: at the door of his cell, he showed that he was "game." Scarcely was he bidden to enter the dungeon, than he turned his face up to the constable, and his eyes twinkling and leering, and his little mouth quivering with scorn, he said—"You don't mean it, Mister; I know you don't mean it."

"Come, in with you, ragged and sarey!" cried the constable.

"Well, then," said the urchin, "here goes—good night to you," and so saying, he flung a summer-set into the cell: the lock was turned, and Bright Jem—fetching a deep groan—quitted the watch-house, his wife, sobbing aloud, following him.

"What can they do to the poor child?" asked Mrs. Aniseed of Jem, as the next morning he sat silent and sorrowful, with his pipe in his mouth, looking at the fire.

"Why, Susan, that's what I was thinking of. What can they do with him? He isn't old enough to hang; but he's quite big enough to be whipped. Bridewell and whipping: yes, that's it, that's how they'll teach him. They'll make Jack Ketch his schoolmaster; and nicely he'll learn him his lesson towards Tyburn. The old story, Susan—the old story," and Jem drew a long sigh.

"Don't you think, Jem, something might be done to send him to sea? He'd get taken away from the bad people about him, and who knows, might after all turn out a bright man." Such was the hopeful faith of Mrs. Aniseed.

"Why, there's something in that to be sure. For my part, I think that's a good deal what the sea was made for—to take away the offal of the land. He might get cured at sea; if we could get anybody as would take him. I'm told the sea does wonders, sometimes, with the morals of folks. I've heard of thieves and rogues of all sorts, that were aboard ship, have come round 'straordinary. Now, whether it's in the salt water or the bo'swains, who shall say? He would n't make a bad drummer, neither, with them little quick fists of his, if we could get him in the army."

"Oh, I'd rather he was sent to sea, Jem," cried Mrs. Aniseed, "then he'd be out of harm's way."

"Oh, the army reforms all sorts of rogues, too," averred Jem. "Sometimes they get their morals pipeclayed, as well as their clothes. Wonderful what heroes are made of, sometimes. You see, I suppose, there's something in some parts of the trade that agrees with some folks. When they storm a town now, and take all they can lay their hands on, why there's all the pleasure of the robbery without any fear of the gallows. It's stealing made glorious with flags and drums. Nobody knows how that little varmint might get on."

Here Jem was interrupted by the sudden appearance of a woman hung with rags and looking prematurely old. Misery and vice were in her face, though the traces of evil were for the time

softened by sorrow. She was weeping bitterly, and with clasped trembling hands, ran into the room. It was the wretched mother of young St. Giles; the miserable woman who more than six years before had claimed her child in that room; who had borne her victim babe away to play its early part in wretchedness and deceit. She had since frequently met Jem, but always hurried from him. His reproofs, though brief, were too significant, too searching, for even her shame to encounter. "Oh, Jem! Jem!" she cried, "save my dear child—save my innocent lamb."

"Ha! and if he is n't innocent," cried Jem, "whose fault 's that?"

"But he is—he is," screamed the woman. "You won't turn agin him, too! He steal anything! A precious cretur! he might be trusted with untold gold!"

"Woman," said Jem, "I would n't like to hurt you in your trouble; but have n't you no shame at all! Don't you know what a bit of truth is, that even now you should look in my face, and tell me such a wicked lie?"

"I don't, Jem—I don't," vociferated the woman. "He 's as innocent as the babe unborn."

"Why, so he is, as far as he knows what 's right and what 's wrong. He has innocence; that is, the innocence you 've taught him. Teach a child the way he should go," cried Jem, in a tone of some bitterness, "and you 've taught him the way to Newgate. The Lord have mercy on you! What a sweet baby he was, when six year and a half ago you took him from this room—and what is he now! Well, well, I won't pour water on a drowned mouse," said Jem, the woman crying more vehemently at his rebuke, "but how you can look in that child's face, and arterwards look up at heaven, I don't know."

"There 's no good, not a ha'porth in all this preaching. All we want to know is this. Can you help us to get the young 'un out o' trouble?" This reproof and interrogation were put in a hoarse, sawing voice by a man of about five-and-thirty, who had made his appearance shortly after St. Giles' mother. He was dressed in a coat of Newgate cut. His hat was knowingly slanted over one eyebrow, his hands were in his pockets, and at short intervals he sucked the stalk of a primrose that shone forth in strong relief from the black whiskers and week's beard surrounding it.

"And who are you?" asked Jem, in a tone not very encouraging of a gentle answer.

"That 's a good 'un, not to know me. My name 's Blast—Tom Blast; not ashamed of my name," said the owner, still champing the primrose.

"No, I dare say not," answered Bright Jem. "Oh, I know you now. I 've seen you with the boy a singing ballads."

"I should think so. And what on it! No disgrace in that, eh! I look upon myself as respectable as any of your folks as sing at your fine play-house. What do you all pipe for but money? Only there 's this difference; they gets hundreds of pounds—and I gets half-pence. A singer for money 's a singer for money—whether he stands upon mud or a carpet. But all 's one for that. What 's to be done for the boy? I tell his mother here not to worry about it—it 'wont be more than a month or two at Bridewell, for he 's never been nabbed afore: but it 's no use a talking to women, you know; she won't make her life happy, no how. So we 've come to you."

"And what can I do!" asked Jem—"I 'm not judge and jury, am I?"

"Why, you know Capstick, the muffin-man. Well, he 's a householder, and can put in a good word for the boy with the beak. I suppose you know what a beak is?" said Thomas Blast, with a satirical twist of the lip. "Not too fine a gentleman to know that?"

"Why, what does Capstick know of little St. Giles?" asked Jem.

"Oh, Jem," said the woman, "yesterday he stood his friend. He 's a strange cretur, that Capstick; and often does a poor soul a good turn, as if he 'd eat him up all the while. Well, yesterday arternoon, what does he do but give my precious child—my innocent babe—two dozen muffins, a basket and a bell."

"I see," cried Jem, with glistening eyes, "set him up in trade. God bless that muffin-man."

"That 's what he meant, Jem; but it was n't to be—it was n't to be," cried the woman with a sigh.

"No—it warn't," corroborated Mr. Blast. "You see the young un—all agog as he was—brought the muffins to the lane. Well, we had n't had two dinners, I can tell you, yesterday; so we sells the basket and the bell for sixpenn'orth of butter, and did 't we go to work at the muffins." And Mr. Blast seemingly spoke with a most satisfactory recollection of the banquet.

"And if they 'd have poisoned all of you, served you right," cried Jem, with a look of disgust. "You *will* kill that child—you won't give him a chance—you will kill him body and soul."

"La, Jem! how can you go on in that way!" cried the mother, and began to weep anew. "He 's the apple of my eye, is that dear child."

"None the better for that, by the look of 'em," said Jem. "Howsomever, I 'll go to Mr. Capstick. Mind, I don't want neither of you at my heels; what I 'll do—I 'll do by myself," and without another word, Bright Jem took his cap, and, unceremoniously passing his visitors, quitted the room. His wife, looking coldly at the newcomers, intimated a silent wish that they would follow him. The look was lost upon Mr. Blast, for he immediately seated himself; and seizing the poker, with easiest familiarity beat about the embers. Mrs. Aniseed was a heroic woman. Nobody who looked at her, whilst her visitor rudely disturbed her coals, could fail to perceive the struggle that went on within her. There are housewives whose very heartstrings seem connected with their pokers; and Mrs. Aniseed was of them. Hence, whilst her visitor beat about the grate, it was at once a hard and delicate task for her not to spring upon him, and wrest the poker from his hand. She knew it not, but at that moment the gentle spirit of Bright Jem was working in her; subduing her aroused passion with a sense of hospitality.

"A sharp spring this, for poor people, is n't it, Mrs. Aniseed?" observed Mr. Blast. "It seems quite the tail of a hard winter, does n't it?" Mrs. Aniseed tried to smile a smile—she only shivered it. "Well, I must turn out, I 'sposè; though I have n't nothing to do till night—then I think I shall try another murder: it 's a long while since we 've had one."

"A matter of two months," said the mother of St. Giles, "and that turned out no great things."

"Try a murder," said Mrs. Aniseed with some apprehension, "what do you mean?"

"Oh, there 'll be no blood spilt," answered Mr. Blast, "only a bit of Grub-street, that's all. But I don't know what's come to the people. They don't snap as they used to do. Why, there's that Horrible and Particular Account of a Bear that was fed upon young Children in Westminster: I've known the time when I've sold fifty of 'em afore I'd blowed my horn a dozen times. Then there was that story of the Lady of Fortin that had left Twins in the Cradle, and run off with her Husband's Coachman—that was a sure crown for a night's work. Only a week ago it did n't bring me a groat. I don't know how it is; people get sharper and sharper, as they get wickeder and wickeder."

"And you don't think it no harm, then," said Mrs. Aniseed, "to make bread of such lies?"

"What does it signify, Mrs. Aniseed, what your bread's made of, so as it's a good color, and plenty of it! Lord bless you; if you was to take away all the lies that go to make bread in this town, you'd bring a good many peck loaves down to crumbs, you would. What's the difference atween me and some folks in some newspapers! Why this: I sells my lies myself, and they sell 'em by other people. But I say, Mrs. Aniseed, it is cold isn't it?"

Mrs. Aniseed immediately jumped at the subtle purpose of the question; and curtly, frozenly replied—"It is."

"A drop o' something would n't be bad such a mornin as this, would it?" asked the unabashed guest.

"La! Tom," cried St. Giles' mother, in a half-tone of astonishment and deprecation.

"I can't say," said Mrs. Aniseed; "but it might be for them as like it. I should suppose, though, that this woman—if she's got anything of a mother's heart in her—is thinking of something else, a good deal more precious than drink."

"You may say that," said the woman, lifting her apron to her unwet eye.

"And there's a good soul, do—do when you get the dear child home again—do keep him out of the streets; and don't let him go about singing of ballads, and"—

"That's all mighty fine, Mrs. Aniseed," said Mr. Blast, who, foiled in his drink, became suddenly independent in his language—"all mighty fine; but, after all, I should think singing ballads a little more genteel than bawling for coaches, and making dirty money out of fogs, and pitch and oakum. A ballad-singer may hold his head up with a linkman any day—and so you may tell Jem, when you see him. Come along," and Mr. Blast twitched the woman by the arm—"come along: there's nothing to be got here but preaching—and that will come in time to all of us."

"Don't mind what he says," whispered St. Giles' mother to Mrs. Aniseed, "he's a good cretar, and means nothing. And oh, Mrs. Aniseed, do all you can with Mr. Capstick for my innocent babe, and I shan't say my prayers without blessing you." With this, the unwelcome visitors departed.

We must now follow Bright Jem to the house of the muffin-man. Jem has already told his errand to Mr. Capstick; who, with evident sorrow and disappointment at his heart, is endeavoring to look like a man not at all surprised by the story related to him. Oh dear, no! he had quite expected it. "As for what I did, Mr. Aniseed"—said Capstick—"I did it with my eyes open. I

knew the little vagabond was a lost wretch—I could read that in his face; and then the muffins were somewhat stale muffins—so don't think I was tricked. No: I looked upon it as something less than a forlorn hope, and I won't flatter myself; but you see I was not mistaken. Nevertheless, Mr. Aniseed, say nothing of the matter to my wife. She said—not knowing my thoughts on the business—she said I was a fool for what I did: so don't let her know what's happened. When women find out they're right, it makes 'em conceited. The little ruffian!" cried Capstick with bitterness—"to go stealing when the muffins might have made a man of him."

"Still, Mr. Capstick," urged Jem, "there's something to be said for the poor child. His mother and the bad uns in Hog Lane would n't let him have a chance. For when St. Giles ran home—what a place to call home!—they seized upon the muffins, and turned the bell and basket into butter, swallowed 'em without so much as winking."

"Miserable little boy!" exclaimed the softened Capstick—and then he groaned, "Wicked wretches!"

"That's true again," said Jem; "and yet hunger hardly knows right from wrong, Mr. Capstick."

Capstick made no answer to this, but looking in Jem's face, drew a long breath.

"And about the boy?" said Jem, "he's but a chick, is he, to go to gaol?"

"It's no use—it's all no use, Mr. Aniseed; we're only throwing away heaven's time upon the matter; for if the little rascal was hanged at once—to be sure, he is a little young for that—nevertheless I was about to say"—and here the muffin-man, losing the thread of his thoughts, twitched his cap from his head, and passed it from right hand to left, and from left to right, as though he sought in such exercise to come plump again upon the escaped idea—"I have it," at length he cried. "I was about to say, as I've an idle hour on hand, I'll walk with you to Lord St. James, and we'll talk to him about the matter."

Now Bright Jem believed this of himself; that in a good cause he would not hesitate—at least not much—to speak to his majesty, though in his royal robes and with his royal crown upon his head. Nevertheless, the ease, the perfect self-possession, with which Capstick suggested a call upon the Marquess of St. James obtained for him a sudden respect from the linkman. To be sure, as we have before indicated, there was something strange about Capstick. His neighbors had clothed him with a sort of mystery; hence, on second thoughts, Bright Jem believed it possible that in happier days the muffin-man might have talked to marquesses.

"Yes," said Capstick, taking off his apron, "we'll see what can be done with his lordship. I'll just whip on my coat of audience, and—hush!—my wife," and Mrs. Capstick stirred in the back parlor. "Not a word where we're going. Not that I care a straw; only she'd say I was neglecting the shop for a pack of vagabonds: and perhaps she's right, though I would n't own it. Never own a woman's right: do it once, and on the very conceit of it, she'll be wrong for the rest of her life." With this apothegm, the muffin-maker quitted the shop, and immediately his wife entered it.

"Glad to see your sister looking so well, Mr. Aniseed," said Mrs. Capstick, somewhat sllily.

"Oh! what, you mean Kitty? Why, she looks as well as she can, and that is n't much, poor soul," said Jem.

"She was here yesterday, and bought some muffins. A dark gentleman was with her," said Mrs. Capstick.

"You mean the black footman," observed Jem, dropping at once to the cold, hard truth.

"Well," and Mrs. Capstick giggled, as though communicating a great moral discovery, "well, there's no accounting for taste, is there, Mr. Aniseed?"

"No," said Jem, "it was never meant to be accounted for, I suppose; else there's a lot of us would have a good deal to answer for. Taste, in some things, I suppose was given us to do what we like with; but, Mrs. Capstick, now and then we do sartinly abuse the privilege."

"Lor, Mr. Capstick! where are you going so fine?" asked his spouse of the muffin-maker, as he presented himself in his best coat, and swathed in a very voluminous neckcloth. "Going to court?"

"You see," said Capstick, "a man—a wretch, a perjurer is to-day put in the pillory."

"And what's that to you, Mr. Capstick?" asked his wife.

"Why, Mary Anne, as a moral man—and, therefore, as a man who respects his oath, I feel it my duty to go and enjoy my egg." With this excuse—worthy of a Timon—did the muffin-maker take his way towards the mansion of Lord St. James. "It's a hard thing," said Capstick on the road, "a hard thing, that you can't always tell a wife the truth."

"I always tell it to my old woman," observed Bright Jem.

"You're a fortunate man sir," said Capstick. "All women can't bear it: it's too strong for 'em. Now, Mrs. Capstick is an admirable person—a treasure of a wife—never know what it is to want a button to my shirt, never—still, I am now and then obliged to sacrifice truth on the altar of conjugal peace. It makes my heart bleed to do it, Mr. Aniseed; but sometimes it is done."

Bright Jem nodded as a man will nod who thinks he catches a meaning, but is not too sure of it. "And what will you say?" asked Jem, after a moment's pause—"what will you say to his lordship, if he'll see you?"

Mr. Capstick cast a cold, self-complacent eye upon the linkman, and replied—"I shall trust to my inspiration." Jem softly whistled—unconscious of the act. Mr. Capstick heard, what he deemed a severe comment, and majestically continued: "Mr. Aniseed, you may not imagine it—but I have a great eye for gingerbread."

"No doubt on it, Mr. Capstick," said Jem, "it's a part of your business."

"You don't understand me," replied the muffin-maker with a compassionate smile. "I mean, my good man, the gingerbread that makes up so much of this world. Bless your heart! I pride myself upon my eye, that looks at once through all the gilding—all the tawdry, glittering Dutch metal—that covers the cake, and goes at once to the flour and water."

"I don't see what you mean, by no means," said Jem; "that is, not quite."

"Look here, sir," said Capstick, with the air of a man who had made himself up for an oration. "What is that pile of brick before us?"

"Why, that you know as well as I," answered Jem; "it's St. James' Palace."

"And there lives his gracious Majesty, George the Third. Now, I dare say, Mr. Aniseed, it's very difficult for you to look upon his Majesty in what I shall beg leave to call, a state of nature?"

"What! like an Injun?" asked Jem. "Well, I must say, I can hardly fancy it."

"Of course not. When you hear of a king, he comes upon you in velvet and fur, and with a crown upon his head—and diamonds blazing upon him—and God knows how many rows of lords about him—and then all the household guards—and the state coach—and the state trumpets, and the thundering guns, and the ringing bells—all come upon your mind as a piece and parcel of him, making a king something tremendous to consider—something that you can only think of with a kind of fright. Is it not so?" asked the muffin-maker.

Jem merely answered—"Go on, Mr. Capstick."

"Now I feel nothing of the sort. I know the world, and despise it," said the muffin-maker.

"I'll take your word for anything but that," cried Jem. "But go on."

"I tell you, sir, I hate the world," repeated Capstick, proud of what he thought his misanthropy: "and of sweet use has such hatred been to me."

Bright Jem cast an incredulous leer at the muffin-man. "I never heard of the sweetness of hatred afore. I should as soon looked for honey in a wasp's nest."

"Ha! Jem, you know nothing; else you'd know how a contempt for the world sharpens a man's wits, and improves his eyesight. Bless you! there are a thousand cracks and flaws and fly-spots upon everything about us, that we should never see without it," said Capstick.

"Well, thank God! I'm in no need of such spectacles," said Bright Jem.

"And for that very reason, Jem," said the muffin-maker, "you are made an every-day victim of—for that reason your very soul goes down upon its knees to things that it's my especial comfort to despise. You have n't the wit, the judgment, to separate a man from all his worldly advantages, and look at him, as I may say, in his very nakedness—a mere man. Now, Jem, that is the power I especially pride myself upon. Hence," continued the muffin-maker—and he brought himself up fronting the palace, and extended his right arm towards it—"hence, I can take an emperor from his crowd of nobles—his troops—his palace walls—his royal robes, and set him before me just as God made him. As I'd take a cocoa-nut, and tear away the husk, and crack the shell, and pare the inner rind, and come at once upon the naked kernel, so, Mr. Aniseed, can I take—aye the Great Mogul—and set him in his shivering flesh before me."

"And you think the knack to do this does you good?" modestly inquired Bright Jem.

"It's my solace, my comfort, my strength," answered the muffin-maker. "And this knack, as you have it, is what I call seeing through the gold upon the gingerbread. Now, is n't it dreadful to think of the thousands upon thousands who every day go down upon their knees to it, believing the gilded paste so much solid metal? Ha! Mr. Aniseed! we talk a good deal about the

miserable heathen; the poor wretches who make idols of crocodiles and monkeys—but Lord bless us! only to think in this famous city of London of the thousands of Christians, as they call themselves, who after all are idolaters of gilt gingerbread!"

"Poor souls!" said Jem, in the fulness of his charity, "they don't know any better. But you have n't answered what I asked; and that's this! What will you say to his lordship if he'll see you!"

"Say to him? I shall talk reason to him. Bless you! I shall go straight at the matter. When some folks go to speak to rich and mighty lords, they fluster, and stammer, as if they could n't make themselves believe that they only look upon a man made like themselves; no, they somehow mix him up with his lands and his castles, and his heaps of money, and the thought's too big for 'em to bear. But I will conclude as I began, Mr. Aniseed. Therefore I say I have a great eye for gilt gingerbread."

This philosophical discourse brought the talkers to their destination. Jem stooped before the kitchen-windows, prying curiously through them. "What seek you there, Jem?" asked Capstick.

"I was thinking," answered Jem, "if I could only see Kitty, we might go in through the kitchen."

Mr. Capstick made no answer, but looking a lofty reproof at Jem, he took two strides to the door, and seizing the knocker, struck it with an assertion of awakened dignity. "Through the hall, Mr. Aniseed; through the hall; no area-stairs influence for me." As he made this proud declaration, the door was opened; and to the astonishment of the porter, the muffin-maker, asked coolly as though he was cheapening pip-pins at an apple-stall—"Can we see the marquess?"

The porter had evidently a turn for humor: he was not one of those janitors who, seated in their leathern chairs, resent every knock at the door as a violation of their peace and comfort. Therefore, curling the corners of his mouth, he asked in a tone of comic remonstrance—"Now what do you want with the marquess?"

"That the marquess shall be benefited by knowing," answered Capstick. "There is my name;" and the muffin-maker, with increasing dignity, handed his shop-card to the porter.

"It's no use," said the porter, shaking his head at the card, "not a bit of use. We don't eat muffins here."

At this moment, Cesar Gum, the African footman, appeared in the hall, and with greatest cordiality welcomed Bright Jem. "Come to see Kitty!—she delight to see you—come down stairs."

"Will you take this to the marquess?" and twitching his card from the porter's fingers, Capstick gave it to Cesar. The black felt every disposition to oblige the friend of Kitty's brother, but raised his hands and shook his head with a hopeless shake. "Stop," said Capstick. He took the card, and wrote some words on the back of it. He then returned it to the porter.

"Oh!" cried the porter, when he had read the mystic syllables, "Cesar, I 'spose you must take it," and Cesar departed on the errand.

CHAPTER VI.

Now, we hope that we have sufficiently inter-

ested the reader, to make him wish to know the precise magic words which, operating on the quickened sense of a nobleman's porter, caused him suddenly to put a marquess and a muffin-maker in mutual communication. What Open Sessame could it be, that written by a St. Giles, should be worthy of the attention of St. James? Great is the power of letters! Whirlwinds have been let loose—fevers quenched, and Death himself made to drop his uplifted dart—by the subtle magic of some brief *lex scripta*, some *abracadabra* that held in the fluid some wondrous spirits, always to be found like motes in the sunbeams, in a magician's ink-bottle. Mighty is the power of words! Wondrous their agency—their volatility. Otherwise how could Pythagoras, writing words in bean-juice here upon the earth, have had the self-same syllables printed upon the moon? What a great human grief it is that this secret should have been lost! Otherwise what glorious means of publication would the moon have offered! Let us imagine the news of the day for the whole world written by certain scribes on the next night's moon—when she shone! What a blessed boon to the telescope-makers! How we should at once jump at all foreign news! What a hopeless jargon of blood and freedom would the Magi of Spain write upon the planet! How would the big-hearted men of America thereon publish their price-current of slaves—the new rate of the *pecunia viva*, the living penny in God's likeness—as the market varied! And France, too, would sometimes with bloody pen write glory there, obscuring for a time the light of heaven, with the madness of man. And Poland, pale with agony, yet desperately calm, would write—"Patience, and wait the hour." And the scribes of St. Petersburg would placard "God and the Emperor"—blasphemous conjunction!—And the old Pope would have his scrawl—and Indian princes, and half-plucked nabobs—and Chinamen—and Laplanders and the Great Turk—and—

No—no! Thank Heaven! the secret of Pythagoras—if indeed he ever had it, if he told not a magnificent flam—is lost; otherwise, what a poor scribbled moon it would be; its face wrinkled and scarred by thousands of quills—tattooed with what was once news—printed with playhouse bills and testimonials gracefully vouchsafed to corn-cutters! No. Thank God! Pythagoras safely dead, there is no man left to scrawl his pot-hooks on the moon. Her light—like too oft the light of truth—is not darkened by quills.

And after this broomstick flight to the moon, descend we to the card of Capstick, muffin-maker. The words he wrote were simply these—"A native of Liguorish, with a vote for the borough."

Now, it is one of the graceful fictions of the English constitution—and many of its fictions no doubt pass for its best beauties, in the like manner that the fiction of false hair, false color, false teeth, passes sometimes for the best loveliness of a tinkered face—it is one of these fictions that the English peer never meddles with the making of a member of the house of commons. Not he. Let the country make its lower house of senators as its best may, the English peer will have no hand in the matter. He would as soon, in his daily walks, think of lifting a load upon a porter's back, as of helping to lift a commoner into his seat. We say, this is a fiction of the constitution; and beautiful in its influence upon the human mind, is fiction. Now, the Marquess of St. James

had in his father's lifetime represented the borough of Liquorish. He was returned by at least a hundred and fifty voters as independent as their very limited number permitted them to be. The calumny of politics had said that the house of St. James carried the borough of Liquorish in its pocket, as easily as a man might in the same place carry a rotten apple or a rotten egg. Let the reader believe only as much of this as his charity will permit him.

Now it oddly enough happened that, at the time when Capstick sought to approach the marquess, parliament was near its dissolution. The wicked old hag was all but breathing her last, yet—case-hardened old sinner!—she expressed no contrition, showed no touch of conscience for her past life of iniquity; for her wrongs she had committed upon the weak and poor; for the nightly robberies upon them who toiled for the especial luxury of those who, like the tenants of a cheese, lived and crawled upon unearned pensions; she repented not of the blood she had shed in the wickedness of war; never called about her soft-hearted, tearful, most orthodox bishops, to assuage the agony of her remorse, and to cause her to make a clean breast of all her hidden iniquity. No. Parliament was about to expire—about to follow her sinful predecessors (what horrid epitaphs has history written upon some of them!) and she heard no voice of conscience; all she heard was the chink of guineas pursed by bribery for her successor.

Even the marquess' porter felt the coming of the new election. His fidelity to his master and his patriotism to merry England had been touched by a report that the borough of Liquorish was about to be invaded by some revolutionary spirit, resolved to snatch it from the time-honored grasp of the house of St. James, and—at any cost—to wash it of the stain of bribery. Somebody had dared to say that he would sit for the independent borough of Liquorish if every voter in it had a gold watch, and every voter's wife a silver tea-pot and diamond ear-rings. This intelligence was enough to make all true lovers of their country look about them. Therefore did the porter consider Mr. Capstick—although a muffin-man—a person of some importance to the marquess. Capstick was a voter for the borough of Liquorish—that was bought and sold like any medal—and therefore, to the mind of the porter, one of the essential parts of the British constitution: hence, the porter was by no means astounded when Cesar returned with a message that Mr. Capstick was to follow him.

The muffin-maker passed along, in no way dazzled or astonished by the magnificence about him. He had made his mind up to be surprised at nothing. Arabian splendors—it was his belief—would have failed to disturb the philosophic serenity of his soul. He had determined, according to his own theory, to extract the man from the marquess—to come, as he would say, direct at humanity divested of all its worldly furniture. Bright Jem meekly followed the misanthrope, treading the floor with gentlest tread; and wondering at the freak of fortune that even for a moment had enabled him, a tenant of Short's Gardens, to enter such an abode. Bright Jem could not help feeling this, and at the same time feeling a sort of shame at the unexpected weakness. He had believed himself proof to the influence of grandeur nevertheless, he could not help it; he

was somewhat abashed, a little flurried at the splendor around him. He was not ashamed of his poverty; yet he somehow felt that it had no business intruding in such a paradise.

In a few moments, the muffin-maker and Jem found themselves in a magnificent library. Seated at a table was a short, elderly little man, dressed in black. His face was round as an apple. He had small, sharp, grey eyes, which for a few moments he levelled steadily at Capstick and Jem, and then suddenly shifted them in a way that declared all the innermost and dearest thoughts of the muffin-maker to be, in that glance, read and duly registered. "Pray be seated," said the gentleman; and Capstick heavily dropped himself into a velvet chair. Bright Jem, on the contrary, settled upon the seat lightly as a butterfly upon a damask rose: and like the butterfly, it seemed doubtful with him, whether every moment he would not flutter off again. Capstick at once concluded that he was in the presence of the marquess. Jem knew better, having seen the nobleman; but thought possibly it might be some earl or duke, a friend or relation of the family. However, both of them augured well of their mission, from the easy, half-cordial manner of the illustrious gentleman in black. His words, too, were low and soft, as though breathed by a flute. He seemed the personification of gentleness and politeness. Nevertheless, reader, he was not of the peerage: being, indeed, nothing more than Mr. Jonathan Folder, librarian—and at times confidential agent—to the Marquess of St. James. He had just received the orders of his lordship to give audience on his behalf, to what might be an important deputation from the borough of Liquorish: hence, Mr. Folder, alive to the patriotic interest of his employer and friend—as, occasionally, he would venture to call the Marquess—was smiling and benignant.

"Mr. Capstick—I presume you are Mr. Capstick"—and Mr. Folder with his usual sagacity, bowed to the muffin-maker—"we are glad to see you. This house is always open to the excellent, and patriotic voters of Liquorish. There never was a time, Mr. Capstick, when it more behoved the friends of the constitution to have their eyes about them. The British constitution—"

"There is no constitution like it," observed the muffin-maker drily.

"That's an old truth, Mr. Capstick"—said Mr. Folder—"and, like all old truths, all the better for its age."

"No constitution like it," repeated the muffin-maker. "I don't know how many times it has n't been destroyed since I first knew it—and still it's all alive. The British constitution, my lord, sometimes seems to me very like an eel; you may flay it and chop it to bits; yet all for that, the pieces will twist and wriggle again."

"It is one of its proud attributes, Mr. Capstick"—said Folder; doubtless he had not heard himself addressed as my lord—"one of the glories of the constitution, that it is elastic—peculiarly elastic."

"And that's, I suppose, my lord"—surely Mr. Folder was a little deaf—"that's why it gets mauled about so much. Just as boys don't mind what tricks they play upon cats—because, poor devils, somebody to spite 'em, has said they've got nine lives. But I beg your pardon, this is my friend—Mr. James Aniseed, better known as Bright Jem," and Capstick introduced the link-man.

Mr. Folder slightly rose from his chair, and graciously bowed to Jem; who, touched by the courtesy, rose bolt upright; and then, after a moment's hesitation, he took half-a-dozen strides towards Mr. Folder, and—ere that gentleman was aware of the design—shook him heartily by the hand. Then, Jem, smiling and a little flushed, returned to his chair. Again taking his seat, he looked about him with a brightened, happy face, for Mr. Folder—the probable nobleman—had returned the linkman's grasp with a most cordial pressure.

"And, Mr. Aniseed," said Folder, "I presume you have also a voice in the constitution; you have a vote for—"

"Not a morsel, my lord," answered Jem. "I have n't a voice in anything; all I know about the constitution is that it means taxes; for you see, my lord, I've only one room and that's a little un—and so, you see, my lord, I've no right to nothing." Whilst Jem pursued this declaration, Mr. Folder, doubtless all unconsciously, rubbed his right hand with his handkerchief. The member might, possibly, have caught some taint from the shake of a low man without a vote.

"Nevertheless, Mr. Capstick, we are happy to see you," said Folder, with a strong emphasis upon the pronoun. "Public morality—I mean the morality of the other party—is getting lower and lower. In fact, I should say, the world—that is, you know what part of the world I mean—is becoming worse and worse, baser and baser."

"There is no doubt of it, my lord," answered Capstick—"for if your lordship—"

Capstick had become too emphatic. It was therefore necessary that Folder should correct him. "I am not his lordship. No, I am not," he repeated, not unobservant of the arched eyebrows of the muffin-maker—"I am deputed by his lordship to receive you, prepared to listen to your wishes, or to the wishes of any of the respectable constituents of the borough of Liquorish. We are not unaware, Mr. Capstick, of the movements of the enemy. But we shall be provided against them. They, doubtless, will be prepared to tamper with the independence of the electors, but as I have said—and Folder et his words fall slowly as though they were so many gems—"as I have said, there we can beat them on their own dirty grounds."

"There is no doubt whatever of it," said Capstick, "none at all. And then in these matters, there's nothing like competition—nothing whatever. For my part, I must say, I like to see it—it does me good—an election, such an election as we have in Liquorish, is a noble sight for a man who, like myself, was born to sneer at the world. At such a time, I feel myself exalted."

"No doubt—no doubt!"—said Mr. Folder.

"Then I feel my worth, every penny of it, in what is called the social scale. For instance, now, I open the shop of my conscience, with the pride of a tradesman who knows he's got something in his window that people *must* buy. I have a handsome piece of perjury to dispose of—"

"Mr. Capstick! Perjury!" cried Folder a little shocked.

"Why, you see, sir," said Capstick, "for most things, there's two names—a holyday name, and a working-day name."

"That's true," said Jem—and then he added with a bow to Folder, "saving your preseece, sir; quite true."

"Yes I'm a voter with a perjury jewel to sell"—said Capstick—"and therefore is n't it delightful to me, as a man who hates the world, to have fine gentlemen, honorable gentlemen, yes titled gentlemen, coming about me and chaffering with me for that little jewel—that when they've bought it of me, they may sell it again at a thumping profit? The marquess is n't that sort of man—"

"I should hope not, Mr. Capstick," said Folder, with a smile that seemed to add—impossible.

"Certainly not. But is n't it, I say, pleasant to a man-hater like me, to see this sort of dealing—to know that, however mean, and wicked, and rascally, the voter is who sells his jewel—he is taught the meanness, encouraged in the wickedness, and more than countenanced in the rascality, by the high and lofty fellow with the money-bag. Oh! at the school of corruption, ar n't there some nice high-nob ushers?"

"Never mind that, Mr. Capstick," said Bright Jem, who began to fear for the success of their mission, if the muffin-maker thus continued to vindicate his misanthropy. "Never mind that. We can't make a sore any better by putting a plaster of bad words to it: never mind that;—but Mr. Capstick," said Jem earnestly, "let's mind something else."

"Then I am to understand," said Mr. Folder, who in his philosophy had been somewhat entertained by the philippics of the muffin-maker—"I am to understand, that your present business in no way relates to anything connected with the borough?"

"Not at present," said Capstick, "only I hope that his lordship won't forget I have a voice. Because—"

At this moment, the door flew open, and a child—a beautiful creature—gambolled into the room. It was young St. James. The very cherub, as Kitty Muggs would have called him, robbed by the iniquitous, the hopeless St. Giles. Truly he was a lovely thing. His fair, fresh young face—informed with the innocence, purity, and happiness of childhood—spoke at once to the heart of the beholder. What guilelessness was in his large blue eyes—what sweetness at his mouth—what a fair, white expanse of brow—adorned with clustering curls of palest gold! His words and laughter came bubbling from the heart, making the sweetest music of the earth; the voice of happy childhood! A sound that sometimes calls us from the hard dealing, the tumult, and the weariness of the world—and touches us with tender thoughts, allied to tender tears.

"What a beautiful cretur!" whispered Jem to the muffin-maker. "He's been kept out of the mud of the world, has n't he? I say; it would be a hard job to suppose that blooming little fellow—with rags on his back, matches in his hand, and nothin' in his belly, eh? Quite as hard as to think young St. Giles was him, eh? And yet it might ha' been—might n't it?"

"Here is the future member for Liquorish," said Mr. Folder, the child having run up to him, and jumping upon his kness. "Here, sir, is your future representative."

"Well, if he keeps his looks," said Jem aside to Capstick, "you won't have nothing to complain."

"Of course, the borough will be kept warm for the young gentleman," said the muffin-man. "He may count upon my vote—yes, I may say, he may depend upon it. In the mean time, sir, I

come upon a little business in which that young gentleman is remotely concerned."

"You don't mean the shameful robbery last night!" said Mr. Folder. "A frightful case of juvenile depravity! Another proof that the world's getting worse and worse."

"No doubt of it," said Capstick, "worse and worse; it's getting so bad, it must soon be time to burn it up."

"The poor little boy who did it, sir," said Bright Jem, very deferentially, "did n't know any better."

"Know no better! Impossible! Why, how old is he?" asked Mr. Folder.

"Jist gone seven, sir, not more;" answered Jem.

"And here's this dear child not yet seven! And do you mean to tell me that he doesn't know better? Do you mean in your ignorance to insinuate that this young gentleman would do such a thing—eh?" cried Folder of the abashed linkman.

"Bless his dear, good eyes, no!" said Jem, with some emotion—"sartinly not. But then he's been taught better. Ever since he could speak—and I dare say almost afore—every night and day he was taken upon somebody's knees, and taught to say his prayers—and what was good and what was bad—and besides that, to have all that was quiet and happy and comfortable about him—and kind words and kind looks that are almost better than bread and meat to children—for they make 'em kind and gentle too—now, the poor little boy that stole that young gentleman's hat—"

"I don't want the hat!"—cried the child, for he had heard the story of the wicked boy at the playhouse—"I don't want it—he may have it if he likes—I told papa so."

"Bless you, for a sweet little dear," said Jem, brushing his eyes.

"The truth is, sir, I came here," said Capstick, "I came as a voter for the independent borough of Liguorish—to intercede with the magnanimity of the marquess for the poor little wretch—the unhappy baby, for he's no more—now locked up for felony."

"What's the use?" asked Mr. Folder, dancing the scion of St. James upon his knee—"what's the use of doing anything for such creatures? It's only throwing pity away. The boy is sure to be hanged some time—depend upon it, when boys begin to steal, they can't leave it off—it's impossible—it's against nature to expect it. I always give 'em up from the first—and, depend upon it, it's the shortest way in the end; it saves a good deal of useless trouble, and I may say false humanity. As for what children are taught, and what they're not taught—why, I think we make more noise about it than the argument's worth. You see, Mr. Capstick, there is an old proverb: what's bred in the bone, you know—"

"Why, sir, saving your presence, if wickedness goes down from father to son, like color—the only way I see to make the world better is to lay hold of all the bad people, and put 'em out of it at once; so that for the future," concluded Jem, "we should breed nothing but goodness."

"Pray, my good man"—asked Mr. Folder—"are you the father of the thief?"

"No, sir, I'm not. I wish I was, with all my heart and soul," cried Jem with animation.

"Humph, you've an odd taste for a father," shortly observed Mr. Folder.

"What I mean, sir, is this," said Jem. "I've

the conceit in me to think that then the boy would n't have been a thief at all. He'd then been better taught, and teaching's everything. I'd have sent him to school, and the devil has n't such an enemy nowhere as a good schoolmaster.* Even now I should like to try my hand upon him, if I could have him all to myself, away from the wickedness he was hatched in."

"I dare say you mean very well, my man, no doubt of it," said Mr. Folder. "Still, I think, the boy had a little taste of the jail—"

"A little taste," groaned Jem, "if he has ever so little, he's pisoned for life; I know that, I've seen it afore."

"And so, sir," resumed Capstick, "I am come as a petitioner, and as a voter for the borough of Liguorish, to ask his lordship's compassion upon this wretched child."

"Well, I'm sure, Mr. Capstick, I'll see what's to be done, I'm sure I will. Now will you,"—and Mr. Folder addressed himself smilingly to the child—"will you ask papa, for your sake, to forgive the naughty boy that run away with your hat?"

"Oh, yes, that I will," answered the child eagerly. "You know I don't care about the hat—I've plenty of hats. I'll run to papa now," and the child jumped from Folder's knee, and bounded from the room.

"There, my man," said Folder, with a smile of triumph to Bright Jem, "there you see the spontaneous work of a good nature."

"With good teaching," said Jem. "I know'd the little cretur that's now locked up—I knowed him when he was a baby, and if he'd only had fair play he'd ha' done the same thing."

"Let us hope he'll improve if he's forgiven," said Mr. Folder. "I will, however, go to his lordship, and know his fate." With this, Folder quitted the apartment on his benevolent mission.

"What a capital thought it was of you, Mr. Capstick, to come here—it had never entered my head," said Jem.

"Nothing like approaching the fountain source," said Capstick, serenely. "Besides, I know an election is near at hand; and as an election approaches, you can't think how it takes the stiffness out of some people. There's no accounting for it, I suppose, but so it is."

"A great many books here, Mr. Capstick"—said Jem, looking reverentially at the loaded shelves—"I wonder if his lordship's read 'em all."

"Humph," answered the scoffing muffin-maker, "it's not so necessary to read a library; the great matter's to get it. With a good many folks heaps of books are nothing more than heaps of acquaintance, that they promise themselves to look in upon some day."

"Well," said Jem, his eyes glistening, "I never see books all in this fashion, without think-

* I will not say a village schoolmaster is a more important person in the state than he who is peculiarly entrusted with the education of the Prince of Wales, though I think he is a far more important personage than the highest state officer in the king's household. The material he has to deal with is man, and I think it would be rather rash to venture to limit his range or capacities.—*Lord Morpeth at the York Diocesan National Education Society.* [Had a plebeian enunciated this great truth, he would, from certain quarters, have been pelted with the sounding yet harmless epithets of demagogue and revolutionist. Here, however, it is an English nobleman who places a village schoolmaster above a royal chamberlain. All honor to such nobility!]

ing that the man as has 'em is a kind of happy conjuror, that can talk when he likes with all sorts of good spirits, and never think a flea-bite of half the rubbish in the world about him."

Jem had scarcely uttered this hopeful sentence, when young St. James ran in, quickly followed by Mr. Folder. "Yes, yes," cried the child, all happiness, "papa says I must forgive him, as we ought always to forgive one another—and you 're to tell him from me that he's to be a good boy and never do so again."

"Bless your sweet heart!" cried Bright Jem, and the tears sprang to his eyes. The muffin-maker said nothing, but coughed and bowed.

"There, I think, Mr. Capstick," said Folder in a low voice, "there, I think, is a future treasure for the borough. I trust you 'll not let this little story be lost on the good folks of Liquorish. Nobody will appear against the culprit, and therefore take him, and if you can, among you make a bright man of him. Good morning, Mr. Capstick—good morning," and Folder bowed the visitors from the room. Bright Jem paused at the door, and looking back at the child cried, "God bless you every day of your life."

Jem and the muffin-maker were about to quit the house, when they were accosted by Cesar Gum in the hall. In a confidential whisper he said—"Come and take some turkey and wine for lunch: prime Madeary—den we can go to jail for tref: dreadful ting, taking oder people's goods—

come and hab some wine." And then in a still lower tone—"Give you bottle for yusef."

To this invitation, Capstick made no answer; but having looked up and down at the black, strode to the door. Bright Jem nodded—uttered a brief good morning, and followed his companion into the street, leaving Cesar Gum—who had wholly forgotten Jem's previous indignation at the peculated gunpowder—in astonishment at his rejected hospitality.

"We 'll now go to Bow-street," said Capstick; and fast as they could walk, they took their way to that abode of justice. They arrived there only a few minutes before the arraignment of young St. Giles at the bar; where he stood, in his own conceit, a miniature Turpin.

"Where are the witnesses—who makes the charge?" There were no witnesses. Again and again his worship put the question. And then he said, "No one is here who knows anything of the matter. The prisoner must be discharged. Boy, don't let me see you here again." Young St. Giles put his thumb and finger to his hair, jerked a bow, and in a few moments was free—free as the air of Hog-lane.

Jem and Capstick followed him into the street. The muffin-maker seizing him, cried—"You little rascal! What do you say for your lucky escape!"

"Say!" answered young St. Giles—"Why, I know'd it was all gammon—I know'd they could prove nothin' agin me."

DOGS' SCENT FOR GAME.—There is a notion that, dogs lose their scent or smell for game-birds during the season of incubation. That, however, says a correspondent of the Gardener's Chronicle, I consider to be wrong. I think it is more likely that the birds lose, or rather do not emit, scent or smell during the time in question; hence the notion. I mentioned this to a gentleman well acquainted with dogs and game, and he told me the following in favor of what I have advanced. He was once aware of a partridge's nest that was "hard set upon" near where a party of gipsies had fixed their abode, and although they had three dogs with them, yet the wary bird led off her brood three days afterwards. There must be some truth in what I have stated, otherwise the smell from the bird on the nest would have led the prowling dogs upon her. If my views on this subject are correct, it shows a wise provision of Nature to protect birds from harm during incubation; for if it were not so, they must often fall a prey to canine enemies. It may be asked, how does it happen that birds do not emit smell while sitting on eggs? That may be owing to the habits or conditions of birds being changed; for during the time of incubation, they lose in a great measure all thought of self-preservation.

From the Christian Observer.

WITH AN ALMANAC.

If an almanac teach us that life wears away,

It tells us how short-lived our sorrow;
If it register joys that must quickly decay,
It points out far brighter to-morrow.

For then, when the grave shall conclude the brief year

Of earth-born vexations and pleasures,
To the Christian, uprising aloft from the bier,
New worlds shall but open new treasures.

May the lot then be thine *both* portions to know,
That to mortals or seraphs are given;
On earth every blessing that earth can bestow,
With reversion of blessings in heaven.

ABBA FATHER!

"Out of the mouths of babes and sucklings thou hast perfected praise."

At an examination of a deaf and dumb institution some years ago in London a little boy was asked, in writing, who made the world?

He took the chalk and wrote underneath the words—

"In the beginning, God created the heavens and the earth."

The clergyman then inquired in a similar manner—

"Why did Jesus Christ come into the world?"

A smile of gratitude rested on the countenance of the little fellow, as he wrote—

"This is a faithful saying, worthy of all acceptance, that Jesus Christ came into the world to save sinners."

A third was then proposed, evidently adapted to call the most powerful feelings into exercise—

"Why were you born deaf and dumb, when I can hear and speak?"

"Never," says an eye-witness, "shall I forget the look of resignation which sat upon his countenance, as he again took the chalk and wrote—

"Even so Father, for so it seemed good in thy sight."

From Chambers' Journal.

MORNINGS WITH THOMAS CAMPBELL.

It was on a fine morning in May, 1840, that I first called on Mr. Campbell. He then lived in chambers, No. 61, Lincoln's Inn Fields, up two pairs of stairs. He had offered to act as cicerone, and show me the lions of London: and it was with no small pride and pleasure that I repaired to the spot, where he was so often to be seen pacing up and down in solitary meditation. He was always a great walker, and this habit continued with him to the last. I found on the outer door of his rooms, below the brass knocker, a slip of paper on which was written, in his neat classical-like hand, this curious announcement—"Mr. Campbell is particularly engaged, and cannot be seen till past two o'clock." As he had expressly mentioned that I should call between nine and ten o'clock, I concluded that this prohibition could not be meant to be universal, and resolved to hazard an application. He received me with great kindness, and explained that the announcement on his door was intended to scare away a *bore*, who had been annoying him with some manuscripts, and would neither take a refusal nor brook delay. The poet was breakfasting in his sitting-room, which was filled with books, and had rather a showy appearance. The carpet and tables were littered with stray volumes, letters, and papers; whence I inferred that his housemaid was forbidden to interfere with the arrangements of his sanctum. At this time he was, like Charles Lamb, a worshipper of the "great plant," and tobacco pipes were mingled with the miscellaneous literary wares. A large print of the queen hung near the fire-place, the gilded frame of which was covered with lawn paper. He drew my attention to the picture, and said it had been presented to him by her majesty. He valued it highly: "money could not buy it from me," he remarked. In another part of the room was a painting of a little country girl, with a coarse shawl of network pulled over her head and shoulders. The girl was represented as looking out below the shawl with a peculiarly arch and merry expression, something like Sir Joshua Reynolds' Puck. He seemed to dote upon this picture, praised the arch looks of the "sly little minx," and showed me some lines which he had written upon her. These he afterwards published; but as they are comparatively little known, and are not unworthy of his genius, I subjoin them:—

"ON GETTING HOME THE PORTRAIT OF A FEMALE CHILD, SIX YEARS OLD, PAINTED BY EUGENIO LATILLA.

Type of the cherubim above,
Come, live with me, and be my love!
Smile from my wall, dear roguish sprite,
By sun-shine and by candle-light;
For both look sweetly on thy traits;
Or, were the Lady Moon to gaze,
She'd welcome thee with lustre bland,
Like some young fay from fairy-land.
Cast in simplicity's own mould,
How canst thou be so manifold
In sportively-distracting charms?
Thy lips—thine eyes—thy little arms
That wrap thy shoulders and thy head,
In homeliest shawl of netted thread,
Brown woollen network; yet it seeks
Accordance with thy lovely cheeks,
And more becomes thy beauty's bloom

Than any shawl from Cashmere's loom.
Thou hast not to adorn thee, girl,
Flower, link of gold, or gem, or pearl—
I would not let a ruby speck
The peeping whiteness of thy neck:
Thou need'st no casket, witching elf,
No gaud—thy toilet is thyself;
Not even a rose-bud from the bower,
Thyself a magnet, gem, and flower.
My arch and playful little creature,
Thou hast a mind in every feature;
Thy brow with its disparted locks,
Speaks language that translation mocks;
Thy lucid eyes so beam with soul,
They on the canvass seem to roll—
Instructing both my head and heart
To idolize the painter's art.
He marshals minds to Beauty's feast—
He is Humanity's high priest,
Who proves by heavenly forms on earth,
How much this world of ours is worth.
Inspire me, child, with visions fair!
For children, in creation, are
The only things that could be given
Back, and alive—unchanged—to Heaven."

The verses were written on folio paper, the lines wide apart, to leave room for correction—for Campbell, it is well known, was a laborious and fastidious corrector. The passion for children which he here evinces, led sometime afterwards to a ludicrous circumstance. He saw a fine child, about four years old, one day walking with her nurse in the park; and on his return home, he could not rest for thinking of his "child sweet-heart," as he called her, and actually sent an advertisement to the *Morning Chronicle*, making inquiries after his juvenile fascinator, giving his own address, and stating his age to be sixty-two! The incident illustrates the intensity of his affections, as well as the liveliness of his fancy—for, alas! the poet had no home-object to dwell upon, to concentrate his hopes and his admiration. Several hoaxes were played off on the susceptible poet in consequence of this singular advertisement. One letter directed him to the house of an old maid, by whom he was received very cavalierly. He told his story—but "the wretch," as he used to say, with a sort of peevish humor, "had never heard either of him or his poetry!"

When I had read the lines, Mr. Campbell retired for a few minutes. "You can look over the books," he said, "till I return." Who has not felt the pleasure of looking over the shelves of a library, with all their varied and interesting associations! The library of a man of genius, too, has peculiar attraction, for it seems to admit us to his familiar thoughts, tastes, and studies. Campbell's library was not very extensive. There were some good old editions of the classics, a set of the *Biographie Universelle*, some of the French, Italian, and German authors, the Edinburgh Encyclopædia (to which he had been a large contributor) and several standard English works, none very modern. He did not care much to keep up with the literature of the day; and his chief delight was—when not occupied with any task—to lounge, in his careless indolent way, over some old favorite author that came recommended to him by early recollections. He occasionally made marginal notes on the books he read. I happened to take down the first volume of "The Beauties of English Poesy, selected by Oliver Goldsmith,"

1787. On the blank leaf of this unfortunate compilation Campbell had written the fact, that, "poor Goldy" had inserted among his "Beauties" *designed for young readers*, Prior's stories of Hans Carvel and the Ladle. "The circumstance," he added, "is as good as the tales, besides having the advantage of being true." I may here remark, that Mr. Campbell could scarcely ever read Goldsmith's poetry without shedding tears.

The poet soon returned from his dressing-room. He was generally careful as to dress, and had none of Dr. Johnson's indifference to fine linen. His wigs (of which he had a great number) were always nicely adjusted, and scarcely distinguishable from natural hair; while about an inch of whisker on the cheek was colored with some dark powder, to correspond with the wig. His appearance was interesting and handsome. Though rather below the middle size, he did not seem little; and his large dark eye and countenance altogether bespoke great sensibility and acuteness. His thin quivering lip and delicate nostril were highly expressive. When he spoke, as Leigh Hunt has remarked, dimples played about his mouth, "which nevertheless had something restrained and close in it, as if some gentle Puritan had crossed the breed, and left a stamp on his face, such as we often see in the female Scotch face rather than the male." He had, like Milton, a "delicate tunable voice," its high notes being somewhat sharp and painful. When a youth, Campbell was singularly beautiful, which, added to the premature development of his taste and genius, made him an object of great interest. A few literary persons still survive (Joanna Baillie among the number) who knew him at this period, and remember him, like a vision of youth, with great enthusiasm. He was early in flower—the fruit, perhaps, scarcely corresponding (at least in quantity) with the richness of the blossom. Campbell was quite sensible of his interesting appearance, and was by no means disposed to become *venerable*. He cared little for the artist who copied nature exactly. Lawrence painted and Baily sculptured him *en beau*. Late in life he sat to Park, the sculptor, but he would not take off his wig; and the bust (a true and vigorous one) was no especial favorite because of its extreme fidelity. In personal neatness and fastidiousness, no less than in genius and taste, Campbell, in his best days, resembled Gray. Each was distinguished by the same careful finish in composition, the same classical predilections and lyrical fire, rarely but strikingly displayed. In ordinary life they were both somewhat finical, yet with great freedom and idiomatic plainness in their unreserved communications; Gray's being evinced in his letters, and Campbell's in conversation. Gray was more studious of his dignity; Campbell often acted rashly from the impulse of the moment, careless of consequences. When the late Mr. Telford, the engineer, remonstrated with him on the inexpediency of contracting an early marriage, he said gaily, "When shall I be better off! I have fifty pounds, and six months' work at the Encyclopædia!" To these personal *nugæ* I may add, that his Scottish accent was not strongly-marked, and did not detract from his point and elegance either as a lecturer or converser.

We shortly sallied out. Mr. Campbell was rather nervous, and hesitated at the street crossings. I said the noise of London was intolerable, but that long usage must reconcile people to it. "Never with some," said he: "I have been used

to it for nearly forty years, and am not yet reconciled to it." He certainly seemed uneasy when within the full sound of the great Babel and her interminable roar. When we got to a quiet alley or court he breathed more freely, and talked of literature. He expressed his regret at having edited Shakspeare, or rather written his life for a popular edition of the dramas, as he had done it hurriedly, though with the right feeling. "What a glorious fellow Shakspeare must have been," said he; "Walter Scott was fine, but had a worldly *twist*. Shakspeare must have been just the man to live with." He spoke with affection and high respect of Lord Jeffrey. "Jeffrey," said he, "will be quite happy now. As a judge, he has nothing to do but seek and follow truth. As an advocate, he must often have had to support cases at which his moral nature revolted." Talking of Jeffrey's criticism, I instanced his review of Campbell's *Specimens of the Poets*, which is copious, eloquent, and discriminating. "You must have taken great pains with some of the lives," I said. "I did," he replied, "*yet they say I am lazy*. There is a washy, wordy style of criticism, and of telling facts, which looks specious, and imposes on many: I wanted, above all things, to avoid that." "You might perhaps have added to your specimens with advantage. Part of Thomson's *Seasons* for example, might have been given, as well as the first canto of the *Castle of Indolence*." "The *Castle of Indolence* is a glorious poem," was his only answer. It must be admitted that in his selections from the poets Mr. Campbell sometimes betrays the waywardness and caprice of a man of genius; but his criticism is invariably sound, and his style of narrative picturesque and graceful. "Spenser," he continued, "is too prolix—his allegory too protracted. Here Thomson, from the nature of his subject, had the advantage. What a fine picture is that of Spenser reading the *Fairy Queen* to Raleigh on the green beside his Irish castle! Raleigh such a noble fellow, and Spenser so sweet a poet; and the country so savage, with its Irish kerns and wild Desmonds, with their saffron-colored kilts and flowing hair!" And the kindling poet quoted some of Spenser's lines—

"I sat, as was my trade,
Under the foot of Mole, that mountain hoar,
Keeping my sheep amongst the cool shade
Of the green alders by the Mulla's shore."

"The *Mole*," said Campbell, "is the Balligowra hills, and the *Mulla* is the Awbeg river: they should change the names, making Spenser god-father. With equal poetical grace Spenser calls Raleigh the 'Shepherd of the Ocean,' and the 'Summer's Nightingale,' both fine characteristic appellations. I like the last particularly, for Raleigh was really a poet, and he planted all about his house at Youghal with myrtles and sweet-smelling plants. Spenser's place, Killecolman Castle, was only a few miles from Youghal, and no doubt they saw many sunsets together." Campbell was here on a congenial theme, and I am tempted to quote what he has said so eloquently and picturesquely on the same subject in his *Specimens*:—

"When we conceive Spenser reciting his compositions to Raleigh in a scene so beautifully appropriate, the mind casts a pleasing retrospect over that influence which the enterprise of the discoverer of Virginia, and the genius of the author

of the Fairy Queen, have respectively produced on the fortune and language of England. The fancy might even be pardoned for a momentary superstition, that the genius of their country hovered, unœen, over their meeting, casting her first look of regard on the poet that was destined to inspire her future Milton, and on the other on the maritime hero who paved the way for colonizing distant regions of the earth, where the language of England was to be spoken, and the poetry of Spenser to be admired."

This would form a fine painting in the hands of Maclise, or some other poet-spirited artist. Only a few fragments of Spenser's castle remain, matted with ivy; but the situation is still lonely and beautiful—undefaced by any incongruous images or associations. Some of Raleigh's myrtles have also been preserved, and his house still stands. The melancholy fate of both these great men deepens the interest with which we regard their residences. The poet, as is well known, was driven from Kilkolman by a furious band of rebels, who set fire to the castle, burning an infant child in the ruins, and causing, within a few months, from melancholy and despair, the death of the gifted Spenser. Raleigh was sacrificed to the cruelty and cupidity of James I. Let us drop a tear over their sad and chequered history, and thank God that genius, taste, and enterprise, now flourish under milder suns and happier influences!

Campbell was keenly alive to such impressions, and loved to tread as it were in the footsteps of the departed great. He regretted that only one of Milton's London houses should be left—one occupied by him when Latin secretary in Westminster. This house looks into St. James' Park, and is situated in York-street (No. 18), in a poor and squalid neighborhood; but it was then "a pretty garden-house, next door to the Lord Scudamore's." Milton occupied it eight years—from 1651 to 1659. We went also to Dryden's last residence, in Gerrard-street, Soho. Here "glorious John" wrote his magnificent Ode and his Fables, and here he died on May morning, 1700. The house is a respectable old-fashioned dwelling. It was formerly occupied by a comely dame—a Wife of Bath—who dealt in contraband laces, gloves, &c. The late Lord Holland often called to see the interior; but the cautious mistress, presuming that his portly and comfortable presence was that of a custom-house officer or other government functionary, kept the door in her hand, and steadily rejected the solicitations of the peer. Windmill-street, where Sir Richard Steele ran off on seeing the bailiff, is in the close vicinity, and the incidents are, in character and keeping, not unlike each other. There was also Congreve's house at Surrey-street, in the Strand; Johnson's famous residence in Bolt Court, Fleet-street, (now profaned, as he would deem it, by its conversion into a printing-office for a dissenters' newspaper,) and poor Goldsmith's chambers in the Temple, No. 2, Brick Court. His rooms were on the right hand ascending the staircase (as the faithful Mr. Prior relates in his Memoir,) and consisted of three apartments. These are now occupied by a solicitor, who pens law papers in the room where Goldy wrote his plays, or watched the rooks cawing about the time-honored court and garden.

"I have," he says in his Animated Nature, "often amused myself with observing their plan of policy from my window in the Temple, that looks upon a grove where they have made a colony in the midst of the city. At the commencement

of spring, the rookery, which during the continuance of winter seemed to have been deserted, or only guarded by about five or six, like old soldiers in a garrison, now begins to be once more frequented; and in a short time all the bustle and hurry of business is fairly commenced."

And there they still bustle and hurry in spring, while Goldsmith sleeps without a stone in the Temple burying-ground. The poet's apartments were looked upon as airy and even splendid in their day. The walls are wainscotted, but have now a dingy appearance. Their occupant was thought to have spent an unnecessarily large sum (£400) in furnishing them, yet the sale catalogue (printed by Prior) shows only one department of profuse expenditure—one highly characteristic of the poet's principle foible, personal vanity. He had only one bed, one sofa, and a moderate complement of necessaries, but he had "two oval glasses, gilt frames," "two ditto, two light girandoles," "a very large dressing-glass, mahogany frame," and "a three-plate bordered chimney-glass, gilt frame." In this multiplicity of mirrors the poet could dress and admire his little undignified person, arrayed in his bloom-colored coat and blue silk breeches. Goldsmith, though contemned and laughed at in his day, and held far inferior to his illustrious friend Johnson, now overtops the whole of that brilliant circle in real popularity and genuine fame. "The wonder is," as Campbell remarked, "how one leading so strange a life from his youth upwards, could have stored his mind with so much fine knowledge, taste, and imagery. His essays are full of thought, and overflow with choice and beautiful illustration."

"Have you been to Windsor?" asked Mr. Campbell. I replied that I had, and spoke of the magnificence of the palace and the parks. "Ay," said he, "the old oaks—the noble old oaks. Did you notice how they spread out their gnarled roots and branches, laying hold of the earth with their talons?" and he put out his clenched hand to help the expression of his vigorous and poetical image. All Scotchmen visiting London in spring should go, he said, a night or two to Windsor, Kew, or Richmond, to hear the nightingale. It was also heard in full voice in the grove around Sion House, the seat of the Duke of Northumberland. He thought Milton's description of the nightingale's note correct as well as rich—

The Attic bird

Trills her thick-warbled notes the summer long.

He maintained, also, with Chaucer and Charles James Fox, (a singular juxtaposition,) that the nightingale's note was a merry one, and "though Theocritus mentions nightingales six or seven times, he never mentions their note as plaintive or melancholy." Because it is heard in the silence of the night, generally when we are alone, and amidst the gloom of thick woods, we attach melancholy associations to it. "For pure English nature, feeling, and expression, read Dryden. He is the best informer and expositor." We must understand this as applicable to Dryden's late productions—not his rhyming tragedies and stiff quatrains, which are anything but natural or pleasing.

In the course of our ramble, we called on the poet's namesake, Mr. Thomas Campbell, the sculptor. In looking through the studio, I had occasion to notice the excessive admiration with which he regarded beauty of form and expression. A female bust absolutely entranced him. There

was no tearing him away from it. The fascination was as complete as in the instance of the "Child Sweetheart." This did not seem to be equally the case with pictures. We were afterwards in the National Gallery, and I did not notice any peculiar susceptibility to the beauties of the few very fine pictures in the collection. The charm of the rounded contour, and the effect of the lucid marble, in works of sculpture, no doubt, formed part of the spell. In his *Life of Mrs. Siddons*, Campbell has recorded his impressions on first seeing the Apollo Belvidere in the Louvre; and as the passage is one of the few really worthy of him in that memoir, and illustrates the peculiarity alluded to, I shall extract it:—

"From the farthest end of the spacious room, the god seemed to look down, like a president, on the chosen assembly of sculptured forms; and his glowing marble, unstained by time, appeared to my imagination as if he had stepped freshly from the sun. I had seen casts of the glorious statue with scarcely any admiration; and I must undoubtedly impute that circumstance, in part, to my inexperience in art, and to my taste having till then lain torpid. But still I prize the recollected impressions of that day too dearly to call them fanciful. They seemed to give my mind a new sense of the harmony of art—a new visual power of enjoying beauty. Nor is it mere fancy that makes the difference between the Apollo himself and his plaster casts. The dead whiteness of the stucco copies is glaringly monotonous, whilst the diaphanous surface of the original seems to soften the light which it reflects. Every particular feeling of that hour is written indelibly on my memory. I remember entering the Louvre with a latent suspicion on my mind that a good deal of the rapture expressed at the sight of superlative sculptures was exaggerated or affected; but as we passed through the passage of the hall, there was a Greek figure, I think that of Pericles, with a chlamys and helmet, which John Kemble desired me to notice; and it instantly struck me with wonder at the gentlemanlike grace which art could give to a human form with so simple a vesture. It was not, however, until we reached the grand saloon that the first sight of the god overawed my incredulity. Every step of approach to his presence added to my sensations, and all recollections of his name in classic poetry swarmed on my mind as spontaneously as the associations that are conjured up by the sweetest music."

We next went to the British Museum. I had previously seen the Elgin marbles and other works of art, and Mr. Campbell proposed that we should just glance at the library. He sent in his card to Sir Henry Ellis, who came and conducted us through the rooms. The poet was warm in his admiration of the large room. Sir Henry said there were about 300,000 volumes in the library. The Louvre contains 700,000 or 800,000; but single pamphlets or thin volumes are counted separately; not bound together, several in a volume, as in our national institution. The Cambridge University library consists of about 150,000 volumes—the Bodleian, I should suppose, considerably more; and the rate of increase is about 5000 a-year. It is scarcely possible for a bookish man, new from the solitude of the country, to survey these princely collections, without echoing the sentiment of James I.—"If it were so that I must be a prisoner, I would have no other prison than such a library, and be chained together with all these goodly authors!"

From the museum we proceeded to the house of Mr. Rogers, in St. James' Place. The venerable author of "The Pleasures of Memory" gave his brother bard a courteous and kind reception. He seemed delighted to see him. "Mr. Rogers," said the younger of the poets, "I have taken the liberty to bring a friend from the country to see your house, as I was anxious he should not leave London without this gratification." Mr. Rogers shook me cordially by the hand, and said every friend of Mr. Campbell's was welcome. "But, Campbell," added he, "I must teach you to speak English properly." [Here the sensitive poet stared and reined up a little.] "You must not abuse that excellent word *liberty*, as you have done on this occasion." We now looked over the pictures, and works of art—a marvellous collection for so small a depository! Mrs. Jameson, Miss Sedgwick, and others, have described the classic mansion in St. James' Place. The hospitality of Rogers is proverbial—his breakfasts are famous. Indeed, the poet has the credit of establishing the breakfast-party as a link in London society. He "refined it first, and showed its use." Mornings in St. James' Place are scarcely inferior to the "delicious lobster nights" of Pope. With the poet of memory, manners the most bland and courteous are, even to strangers, united to the fullest and freest communication of thought and opinion. His delicacy of feeling and expression, and his refined taste, are indeed remarkable; but, in place of rendering him miserable, as Byron has surmised, I should say they contributed to his happiness and enjoyment. His life has been long and prosperous, and his relish of it seems unabated: he has had a "latter spring," lusty and vigorous.

No person perhaps possesses so many literary relics and curiosities as Mr. Rogers. The beautiful manuscripts of Gray, written with a crow-quill pen, are among his treasures. In his library—framed and glazed—is the celebrated agreement between Milton and his publisher for the copyright of *Paradise Lost*. The great poet's signature, though he was then old and blind, "fallen upon evil days," is singularly neat and distinct. He has also a bust of Pope, the clay model by Roubiliac. "My father," said Mr. Rogers, "stood by the side of Pope when Roubiliac was modelling that part of the drapery." A bust of Pope, enriched by such associations, is indeed valuable. The features are larger than the common prints represent. I had seen an original painting of him, taken when he was ten or twelve years younger, by Jervas, but it is greatly inferior in expression. Here we had Pope calm, thoughtful, penetrating, somewhat wasted by age, disease and study, but still the clear fine thinker and man of genius. Mr. Rogers showed us also an original sketch by Raphael, for which, if we recollect right, he said the Marquis of Westminster had offered him as much land as would serve for a villa! Autograph letters, "rich and rare," abound in Mr. Rogers' repositories, with scarce books almost as valuable. On one of the tables lay a large piece of amber enclosing a fly, entire in "joint and limb." Mr. Campbell mentioned that Sidney Smith, who has always some original or humorous remark to make on every object, taking up this piece of amber one day, said, "Perhaps that fly buzzed in Adam's ear." After a couple of hours delightfully spent among the books and pictures, Mr. Rogers invited us to breakfast next morning. When we got to the door, Campbell broke out—"Well, now, there is a happy and enviable poet! He is about

eighty, yet he is in the full enjoyment of life and all its best pleasures. He has several thousands per annum, and I am sure he gives away fifteen hundred in charity.

Next morning Mr. Campbell called at the Tavistock hotel, where he had kindly agreed to meet me, that we might go together to St. James' Place. On the way, I mentioned that I had been reading Leigh Hunt's book about Lord Byron, which I had purchased at a stall. "There is a great deal of truth in it," said he; "but it is a pity Hunt wrote it." He thought Byron would have been a better man if he had continued to live in England: "the open light of English society and English manners would have kept him more generally right." We found at Mr. Rogers' two other guests—Major Burns, second son of the poet, and the Honorable Charles Murray. Neither of these gentlemen had seen Campbell before, and they appeared highly gratified at the meeting. In the conversation that passed, I shall of course only glance at literary or public topics, not casual or hasty remarks. Captain Murray informed the poet of the present state of Wyoming in Pennsylvania, which has lost, if it ever possessed, that romantic seclusion and primitive manners drawn so beautifully by Campbell: it is now the scene of extensive iron and coal works. The conversation then turned on Captain Murray's adventures among the American Indians. He was several months without seeing a white man. He said he fully believed the stories told in narratives of shipwrecks, of men becoming wolfish and unnatural from excessive hunger. He was at one time nearly two days without food, though undergoing severe exercise on horseback. At the close of the second day he got a piece of raw buffalo flesh, which he devoured greedily; and had it been a piece of human flesh, he was almost convinced he could not have refrained from eating it. Major Burns instanced Byron's vivid description of the shipwreck in Don Juan, which was founded on fact. "Yes," said Campbell, "Byron read carefully for materials for his poems." The manner in which Byron introduces the cannibalism of the famished seamen—their first dark hints on the subject of murdering one of their number for food—is certainly a very powerful piece of painting. As the cant phrase is—it is like a sketch by Rembrandt.

The presence of Major Burns naturally led to remarks on his father's genius. Campbell got quite animated. He said Burns was the Shakespeare of Scotland—a lesser diamond, but still a genuine one. Tam O'Shanter was his masterpiece, and he (Campbell) could still repeat it all by heart. It reminded him of a certain class of sculpture—the second or Alexandrian class—in which the figures were cast, not hewn or worked out by patient labor. Tam O'Shanter appeared to have been produced in a similar manner, cast out of the poet's glowing fancy, perfect at once. The actual circumstances attending the composition of Tam O'Shanter are not unlike this, as may be seen from the interesting account given by Mr. Lockhart. As Johnson loved to *gird* at David Garrick, but would allow no one else to censure him, Campbell liked occasionally to have a hit at his countrymen, on the score of their alleged Pharisaical moderation and prudence. Burns, he maintained, had none of the *pauciness* characteristic of his country—he was the most unscotsmanlike Scotsman that ever existed. Some of us demurred to this sally, and attempted to show that Burns had the national

character strongly impressed upon him, and that this was one of the main sources of his strength. His nationality was a font of inspiration. Mr. Rogers said nothing. Campbell then went on to censure the Scotch for their worship of the great. Even Scott was not exempt from the failing. "I was once," said he, "in company with Walter Scott, where there were many of us, all exceedingly merry. He was delightful—we were charmed with him; when suddenly a *lord* was announced. The lord was so obscure, that I had never heard of him, and cannot recollect his name. In a moment Scott's whole manner and bearing were changed. He was no longer the easy, delightful, independent good fellow, but the timid, distant, respectful worshipper of the great man. I was astonished: and, after all, you might have made a score of dukes and lords of Walter Scott, and scarcely missed what was taken away." Mr. Rogers said, if he had a son who wished to have a confidential friend, he would recommend him to choose a Scotsman. He would do so in the spirit of the old maxim, that a man will be found the best friend to another who is the best friend to himself. A Scotsman will always look to himself as well as to his friend, and will do nothing to disgrace either. Thus, in his friend, my son would have a good example as well as a safe adviser.

Mr. Campbell said he had, when a young man, an interview with Charles James Fox, which gave him a very high idea of him as a man. It was too bad, he added, in Sir Walter Scott, even in those bad times, to write of Fox as he did in his political song on Lord Melville's acquittal, Fox being at the time on his death-bed. Mr. Rogers explained that Sir Walter had in that room expressed his deep regret at the circumstance: he said he would sooner have cut off his hand than written the lines if he had known the state in which Fox then was. "This," added Rogers, "Scott told me with tears in his eyes." I mentioned having seen some unpublished letters of Sir Walter, addressed to Lady Hood (now Mrs. Stewart Mackenzie of Seaforth,) in which he also expressed regret on account of his unlucky political song, for which he had been blamed by Lady Hood and the then Marchioness of Stafford.

The poets talked of Shakespeare. Rogers said playfully that Shakspeare's defects of style and expression were so incorporated with his beauties, and we were so blinded by admiration, that we did not discover them. He instanced the construction of the fine passage—

"And the poor beetle that we tread upon,
In corporal sufferance feels a pang as great
As when a giant dies."

"The beetle feels nothing when a giant dies, but of course the poet meant that it felt at its own death a pang as great as a giant feels when he dies. Naturalists will not concede this; but I speak only of the construction of the lines; such slovenly and elliptical expression would not be tolerated in an inferior poet." "We are all taught from youth to idolize Shakspeare," said Campbell. "Yes," rejoined Rogers, "we are brought up in the worship of Shakspeare, as some foreigner remarked." The sonnets of Shakspeare were then adverted to, Mr. Rogers expressing a doubt of their genuineness, from their inferiority to the dramas. The quaint expression, and elabo-

rate, exaggerated style of these remarkable productions would not, however, appear so singular in the time of Elizabeth. Poets are generally more formal and stiff in youth than in riper years, and in the plays of Shakspeare we see the gradual formation of his taste and his acquisition of power. It is worthy of remark, however, as Mr. Campbell mentioned, that the *Venus and Adonis* (a truly fine Shakspearian poem) was written before the sonnets, as the poet, in his dedication to Lord Southampton, calls it "the first heir of his invention."

I took occasion to ask Campbell if it was true that Sir Walter Scott had got the whole of the *Pleasures of Hope* by heart after a few readings of the manuscript one evening. "No," said he; "I had not met Scott when the *Pleasures of Hope* was in manuscript; but he got *Lochiel's Warning* by heart after reading it once, and hearing it read another time: it was a wonderful instance of memory." He corrected me for pronouncing "*Lochiel*" as a dissyllable. "It is *Loch-ee-il*," said he; "such is the pronunciation of the country; and the verse require it." Rogers laughed heartily at the anecdote told by Moore, that Scott had never seen Melrose by moonlight, notwithstanding his poetical injunction—

"If thou would'st view Melrose aright,
Go visit it by the pale moonlight," &c.

"He had seen other ruins by moonlight, and knew the picturesque effect, or he could very easily imagine it." Major Burns said that Scott admitted the same to him on the only occasion he had ever met the great minstrel; and Jonny Bower, the sexton, confirmed the statement, adding, "He never got the key from me at night, and if he had got in, he must have *speeled the wa's*." Campbell was greatly amused at this.

Some observations were made on the English style of Scotch authors. It was acknowledged by both the poets that Beattie wrote the purest and most idiomatic English of any Scotch author, not even excepting those who had been long resident in England. The exquisite style of Hume was warmly praised. "He was substantially honest too," said Campbell. "He was, from principle and constitution, a tory historian, but he makes large and liberal admissions on the other side. When I find him conceding to his opponents, I feel a certainty in the main truth of his narrative. Now, Malcolm Laing is always carping at his opponents, and appears often in the light of a special pleader." "Hume has one sentence in his history," said Mr. Rogers, "which all authors should consider an excellent specimen of his style;" and the venerable poet, with great alacrity, went up to the library, and brought down a volume of Hume. He opened it at the account of the reign of James I., and read aloud with a smile of satisfaction—"Such a superiority do the pursuits of literature possess above every other occupation, that even he who attains but a mediocrity in them, merits the preëminence above those that excel the most in the common and vulgar professions." "Dr. Chalmers," continued Mr. Rogers, "went farther than this. In one of his sermons here, which all the world went to hear, he remarked, when speaking of the Christian character, that it was above that of the warrior, the statesman, the philosopher, and *even the poet*—thus placing you, Campbell, above the Duke of Wellington." "Very

good," said Campbell, laughing, "I would place his father (looking to Major Burns) above any of them." It was impossible not to think of Campbell's own lines in his *Ode to the Memory of Burns*:—

"O deem not 'midst this worldly strife
An idle art the poet brings;
Let high philosophy control,
And sages calm the stream of life,
'Tis he refines its fountain-springs,
The nobler passions of the soul."

The only instance of Mr. Rogers' severity which I noticed in the course of the forenoon, was a remark concerning a literary foreigner who had been on a visit to London, and left an unfavorable impression on his English admirers. "He made himself one evening," said he, "so disagreeable, that I had a mind to be very severe. I intended to have inquired in the tenderest tone how his wife was!" The gentleman alluded to and his wife had, it appears, separated a few days after their marriage from incompatibility of temper. The conversation now turned to the subject of marriage. Mr. Rogers said he thought men had judged too harshly of Swift for his conduct towards Stella and Vanessa. Swift might have the strongest affection for both, yet hesitate to enter upon marriage with either. Marriage is an awful step (a genuine old bachelor conclusion!) and Johnson said truly, that to enter upon it required great moral courage. "Upon my word," said Campbell, "in nine cases out of ten it looks like madness." This led to some raillery and laughter, and we shortly afterwards took our leave. Captain Murray had been compelled to leave early, and we were thus deprived of his lively and varied conversation. Four hours had sped away to my infinite delight. The poets parted with many affectionate words and congratulations, promising "oft to meet again." I walked with Mr. Campbell to the Clarence Club, and on quitting him there, he said, "Be sure to go to Dulwich in the afternoon and see the pictures: you can easily get there, and in the evening roll back to London in that chariot of fire, the railway train."

I did so, and also attempted to Boswellize our morning's talk—my first and only attempt of the kind. Let any one make a similar effort to recall and write down a four hours' conversation, and he will rise with a higher idea of Boswell than he ever previously entertained!

I had afterwards frequent opportunities of meeting the poet. He was seen to most advantage in the mornings, when a walk out of doors, in the sunshine, seldom failed to put him in spirits. He had a strong wish to "make a book" on Greek literature, taking his lectures in the *New Monthly Magazine* for his groundwork. Sometimes I found him poring over Clarke's Homer, or a copy of Euripides, on which occasions he would lay down the volume, take off his spectacles, and say, with pride, "I was at this by seven o'clock in the morning." Early rising was a favorite theme with him, though latterly he was, like Thomson, more eager to inculcate than to adopt the practice. "*Gertrude of Wyoming*" was a daylight production, written during his residence at Sydenham, near London—his first home after marriage, and the scene of his brightest and happiest days. Mr. Campbell spoke with animation one morning of a breakfast he had just had at Mr. Hallam's. "It

was the breakfast of the poets," said he, "for Moore, Rogers, Wordsworth, and Mr. Milman were there. We had a delightful talk." Campbell had very little regard for the "Lake Poets," as they were called, but he held Wordsworth to be greatly superior to the others. He admired Coleridge's criticism, but maintained that he got some of his best ideas from Schlegel. "He was such an inveterate dreamer," said he, "that I dare say he did not know whether his ideas were original or borrowed." Yet Campbell used to ridicule most of the charges brought against authors of direct plagiarism. One day the late John Mayne, the Scottish poet, accused him of appropriating a line from an old ballad—

"Adown the glen rode armed men."

"Pooh," said he, "the old ballad-writer had it first—that was all." Two well-known images in the Pleasures of Hope are taken, it will be recollected, one from Blair's Grave, and the other from Sterne. A poet, in the hour of composition, waiting for the right word, or the closing image, he once compared to a gardener or florist waiting for the summer shower that was to put all his flower-beds into life and beauty. In his own moments of inspiration, however, Campbell was no such calm expectant. He used to be much excited—walking about—and even throwing himself down. In the island of Mull, where he first felt the force of his rapidly-awakening powers, his friends, at such times, used to think him crazed. But to return to our memoranda. Moore, according to Campbell, had the most sparkling and brilliant fancy of any modern poet. "He is a most wonderful creature—a fire-fly from heaven—yet, as Lady Holland said, what a pity we cannot make him bigger!" Scott, he said, had wonderful art in extracting and treasuring up old legends and characteristic traits of character and manners. "In his poems there is a great deal about the highlands, yet he made only passing visits to the country. After his Lord of the Isles came out, a friend said to me, 'Where can Walter Scott have got all those stories about the West Highlands? I was six weeks there, making inquiries, yet heard nothing of them.' 'It is his peculiar talent—his genius,' I replied; for I was nearly six years there, and knew nothing of them either. Crabbe was a pear of a different tree. What work he would have made among the Highland bothies! His *missa severior* would have shown them up. No romance—no legends—but appalling scenes of sordid misery and suffering. Crabbe was an amazingly shrewd man, yet mild and quiet in his manners. One day at Holland-house they were all lauding his simplicity—how gentle he is! how simple! I was tempted to exclaim, 'Yes, simplicity that could buy and sell the whole of you!'"

The early struggles and ill-requited literary drudgery which Campbell had to submit to for years, gave a tinge of severity to some of his opinions and judgments both of men and things. These splenetic ebullitions, however, never interfered with his practical charity and kindness. He loved to do good, and he held fast by old friends and old opinions. Like Burns, he worshipped "firm resolve,"

That stalk of carl-hemp in man.

Among the literary opinions of Mr. Campbell, was one which he was fond of maintaining—the superiority of Smollett as a novelist, compared with Fielding. This is mentioned in the *Life of Crabbe*; and I asked in what points he considered the superiority to consist? "In the vigor and rapidity of his narrative," he said, "no less than in the humor of his incidents and characters. He had more imagination and pathos. Fielding has no scene like that in the robber's hut in *Count Fathom*: he had no poetry, and little tenderness in his nature." Yet the real life and knowledge of human nature evinced by Fielding, his wit, and the unrivalled construction of his plots, seem to place him above his great associate in English fiction. Neither was remarkable for delicacy; but Smollett was incomparably the coarser of the two. Certainly, like good wines, Fielding improves with age, and the racy flavor of his scenes and characters has a mellow ripeness that never cloy on the taste. Mr. Campbell, as already hinted, had a roving adventurous fancy, that loved a quick succession of scenes and changes, and this predilection might have swayed him in favor of Smollett. *Some things* Smollett may have done better than Fielding, but not *entire novels*.

After an interval of two years, I again met Mr. Campbell in London. He was then much changed—feeble and delicate in health, but at times rallying wonderfully. I have a very vivid recollection of a pleasant day spent with him at Dr. Beattie's cottage at Hampstead. We walked over the heath, moralizing on the great city looming in the distance, begirt with villas—

Like a swarth Indian with his belt of beads.

At Beattie's he was quite at home. The kind physician knew him well, and had great influence over him. Mr. Campbell at this time resided at Pimlico. A young Scottish niece acted as his housekeeper, and to this lady he left the whole of his little property.

His letters from Boulogne were few and short, mostly complaining of the cold weather. In a note dated 17th November, 1843, we find him remarking—"The climate here is naturally severer than in England. Joy to you in Scotland, whom Jove treats more mildly! I suppose the cold of the north has been ordered to march all to the south, and that it is to be long billeted upon us!" One cause of the poet's residence in Boulogne was the promotion of his niece's education. Mr. Hamilton, the English consul was, as usual, kind and attentive; but though Campbell now and then looked in upon a ball-room or festive party, he seldom stayed longer than an hour. Dr. Beattie generously went to succor him in his last illness, and the poet had the Church of England service for the sick read to him by the Protestant clergyman of Boulogne. He died calmly and resignedly—his energies completely exhausted. He used to say he was of a long-lived race. Sixty-seven, however, is no very prolonged span of life; yet his two favorite poets, whom he resembled in genius, died much earlier. Gray, at the period of his death, was fifty-five, and Goldsmith only forty-five. Campbell's magnificent funeral in Westminster Abbey is matter of history. *Requiescat in pace!*

ANASTATIC PRINTING.

SPEAKING of this new wonder, Chambers' Journal says:—In contemplating the effect of these astonishing inventions, it is impossible to foresee their results upon the ordinary transactions of life. If any deed, negotiable security, or other legal instrument, can be so imitated that the writer of, and subscriber to it, cannot distinguish his own handwriting from that which is forged, new legislative enactments must be made, and new modes of representing money, and securing property by documentary record, must be resorted to. A paper currency and copyhold securities will be utterly useless, because they will no longer fulfil the objects for which they, and instruments of a like nature, are employed. Again, the law of copyright as respects literary property will have to be thoroughly revised. Let us, for an instant, view the case in reference to "The Times" newspaper. Suppose an early copy of that powerful journal to be some morning procured, and anastatyped in a quarter of an hour. The pirated pages may be subjected to printing machinery, and worked off at the rate of 4000 copies in each succeeding hour, and sold to the public, to the ruinous injury of the proprietors. The government newspaper stamp would be no protection, for of course that could be imitated as unerringly as the rest. This too, is an extreme case against the imitators; for a newspaper would have to be done in a great hurry. Books, maps, prints, and music, could be pirated wholesale, and at leisure.

Let us not be understood to apply any of these remarks to the inventors, as presuming for an instant, or by the remotest hint or inference, that they would be guilty of unworthy conduct. We merely state what is, we fear, inevitable when their inventions become public property, which, according to our information, from their extreme simplicity, is likely very soon to be the case.

The new process produces all the effects of stereotyping, with the advantage of taking the duplicate from a printed impression, instead of from the metal types themselves. So far, however, as we can ascertain, one disadvantage attaches to the new process, which is, that in working off impressions from the zinc plates, a kind of press must be used different from that employed for types—one partaking somewhat of the nature of a lithographic press. Till, therefore, the inventors proceed with their improvements so far as to cause the acid to corrode the interstices of the letters sufficiently deep into the plate, as to make them stand relief of equal height with types, we do not anticipate that, as a substitute for stereotyping, it will be so extensively used as they anticipate. It may also be remarked that the economy of this invention will chiefly be seen in works of limited sale. In such as the present, the typographical arrangements sink into a bagatelle beside the enormous outlay for paper, an abolition of the duty on which would be of more use to such works than an invention doing away with every other expense whatsoever.

In another department of relief printing, there is no question that the anastatic process will cause a complete revolution, and that very speedily; namely, in illustrative and ornamental printing. Wood-engraving will be entirely superseded, for no intermediate process will now be necessary between the draughtsman and the print-

ing of his design. It is generally known that at present the artist draws in pencil his design on the box-wood, and that the engraver, with sharp instruments, cuts away all the white parts or interstices, so as to cause the objects previously figured to stand in relief, that they only may receive the ink passed over them in printing. Unfortunately, many wood-engravers, from want of skill in drawing, do not render the intentions of the designer with fidelity. Now, however, all the draughtsman will have to do will be to make his drawing on paper, and that, line for line, will be transferred to the zinc, and produce, when printed, exactly the same effect as his original draught. A pen is recommended for this purpose, which may be used "on any paper free from hairs or filaments, and well sized. The requisite ink is a preparation made for the purpose, and may be mixed to any degree of thickness in pure distilled water, and should be used fresh and slightly warm when fine effect is to be given. In making or copying a design, pencil may be used, but the marks must be left on the paper, and by no means rubbed with India-rubber or bread. The paper should be kept quite clean, and free from rubbing, and should not be touched by the fingers, inasmuch as it will retain marks of very slight touches." A drawing thus produced can be readily transferred to the zinc in the manner above described for typography.

Two pages of the Art-Union are printed upon the new plan. Besides the letterpress, from which we derive our present information, are five printed drawings and an illuminated letter. "The letterpress," says the editor, "was first set in type by the ordinary printer of the Art-Union, leaving spaces for the drawn or engraved illustrations, which having been set into their respective places on a proof of the letterpress, the whole was cast on to a zinc plate, and so printed off." Neither is it to printing of recent date only that the invention is applicable; transfers from books a century old have already been made. "Rare editions" and "Unique copies" will in a few years vanish from the counter of the book-sale and the shelves of the bibliomaniac. Now it is ascertained how exactly they may be counterfeited, not even Doctor Dibdin himself will be able to venture to pronounce upon a "genuine black-letter."

From the Jewish Expositor.

JUDÆA CAPTA.

DARK is the flow of Siloe's stream,
And Zion's walls are low;
Deserted Judah's cities seem
To mourn their children's woe.

Yet mourn not Judah, for the Lord
Will yet his arm extend,
Help to his suffering sons afford,
And Jacob's ills shall end.

From glowing realms of eastern light,
From evening's softer skies,
From where the Seven that rule the night,
In cold conjunction rise.

From southern climes, where'er they be,
Where'er thy sons may roam,
A remnant yet their Lord shall see,
And find their promised home.

CORRESPONDENCE.

From the tone of an article in the *Times*, there seems to have been some fear of a revulsion in the prosperity of England; but we hope that it was not well founded. The immense increase in the consumption of iron—for ships and houses, as well as for railroads, and upon the Continent as well as in Great Britain—sufficiently accounts for the advance of price, and the increase of business in that branch of trade. Our American iron masters will probably partake of this prosperity.

The *Times* has now its "own correspondent" regularly established at the town of Victoria in Hong-kong; and that writer makes some very interesting but by no means encouraging remarks on the state and prospects of trade. It is to be feared, he says, that much delusion has existed in England on the subject. "Although, ultimately, a new market may be found for English manufactures by the opening of additional ports, and the removal of many restrictions and charges, yet, in fact, China had previously, through Canton, taken all our goods for which there was any demand. Before we can hope for any important increase of that demand, there must be time to create among the Chinese a greater desire for our manufactures—a new order of wants; and until this is effected, this prudent people, who have but little superfluous to dispose of, will hardly expend that little upon goods which they neither appreciate nor admire, simply because they are offered for sale at five ports on the coast instead of one." "It may be well for our mercantile community at home to pause before they take it for granted that there are 300,000,000 people all ready to receive what we are ready to part with. Let them add two other considerations,—first, to introduce new goods, our merchants must be prepared to take more Chinese products in barter; for, if the Chinese enter into a cash trade for opium, we may be assured they will do so for no other product. China is most unfortunately deficient in exports; and the only obvious means, therefore, of suddenly enlarging the market, is to take more tea; and towards this consummation, however devoutly desired, the first step must be a reduction of the duty on tea at home from 220 per cent., the present rate, to something like cent per cent., or 1s. per pound instead of 2s. 2½d. Otherwise, increased imports of tea beyond the consumption only lead

to a fall in the price, which does not leave a sufficient margin for the profit of the importer, or indeed secure him from ruinous loss such as no prudent merchant would risk. The second point referred to consists in the facility with which, in piece-goods and in other important articles of commerce, the Americans can undersell us: in lead they have nearly driven the English out of the market; in cotton goods and 'domestics,' they sell at a rate which will scarcely remunerate the English manufacturer. Trade is at present, and has hitherto been, heavy in everything but opium." The tea-trade has opened inauspiciously. It has been the custom at Canton for the first sales of each season to regulate prices: while the merchants were a limited body, they settled prices deliberately; under the new order of things, brokers have risen up, with no interest beyond their commission; they have not scrupled to purchase teas at any price; prices have therefore begun at a high rate, sales have been checked, some of the finest qualities alone having been sold, and the great mass of the tea left in the hands of the native merchants, to their great disgust. "They cannot, or will not, understand the new order of things, and the necessity for departing from the custom which insisted that the upset price of the first sales should regulate the remainder. The tea-men at Canton have lately issued a truly amusing remonstrance on this subject, addressed to the foreign merchants—'How could we know,' exclaims the Woon merchant of the central flowery land, 'that all you honorable merchants should change your former way, and become crafty, capricious, merely choosing a few teas of chops of the most superior Woon-ning teas, and forthwith desisting, (from purchasing,) causing people to feel the most anxious and painful suspense—the misery of those who look to the corner of the wall and sigh after painted prunes?' However unpalatable the task, the Chinese tea-men, we apprehend, will have to learn that the old custom must be changed, and that much greater reductions than have ever entered into their calculations must be made before they can sell this year's products. The large stock which was received in England last year, to make way for the exchange of our goods on an increased scale, has led to a proportionate diminution of the prices of tea at home; and at the present rate of prices at Canton, no one can purchase without almost certainty of loss."

The Queen's Speech was transmitted, by the electric telegraph on the South-Western Railway. A copy of the Globe, containing it, was received at the London terminus at half-past-two. In two hours, the entire speech, containing 3500 letters, was received at the Gosport station, and immediately afterwards, printed and distributed through the town. A letter from Mr. Cooke at the Gosport station, acknowledging the receipt of the speech, was returned to town, and printed and published in the Globe before 7 o'clock the same evening.

At a meeting of the Polytechnic Institution, Dr. Ryan delivered a lecture for the purpose of noticing an apparatus by Mr. Phillips, called the "fire-annihilator." After explaining the theory of the earlier chemists, and the more modern views of Lavoisier and others, and the consideration of the supporters and non-supporters of combustion, he pointed out the effects of volumes from nitrogen or from carbonic acid upon the flame of coal gas; and after showing that combustion instantly ceased in an atmosphere containing but a short per centage of these gases, he proceeded to explain that Mr. Phillips used a mixture of coke, nitre and sulphate of lime, with a little water. Dr. Ryan kindled a fire in an iron house, and as soon as the combustion was complete, he introduced a small apparatus, not holding more than two ounces of the material, and in half a minute, the fire was completely extinguished.

BOOKS RECEIVED.

THE UNCEASING PRESS of *Harper & Brothers* supplies us, this week, with

NEW ORLEANS AS I FOUND IT, by H. DIDIMUS. This is an original work, we mean a copy-right; and is only the first part, which shows how the writer found it in 1835-6. The second part will show the changes of nine years.

KEEPING HOUSE AND HOUSEKEEPING. A Story of Domestic Life, edited by Mrs. Sarah J. Hale. This little book is on a subject which interests us all, and being by Mrs. Hale, is, of course, both pleasant and good.

WANDERING JEW. Nos. 9 and 10.

THE ILLUSTRATED AND ILLUMINATED BIBLE. No. 22.

VOYAGES ROUND THE WORLD. Of this delightful little book hundreds of thousands will be scattered over the land. It contains the Voyages of D'Entrecasteaux, Marchand, Vancouver, Edwards, Wilson, Fanning, Turnbull, Baudin, Freycinet, Duperrey, D'Urville, Bougainville, La Place, Krusenstern, Kotzebue, Lutk6, Hall, Ruschenberger, Fitzroy, Meyen, Wilson, Belcher and Ross. Price 50 cents!

SOUTHERN LITERARY MESSENGER, for March, 1845.

I WILL BE A LADY: a book for Girls, by Mrs. Tuthill. This is a counterpart to I'll be a Gentleman, by the same publishers, Messrs. Crosby & Nichols, Boston.

THE PRESENT.

Ox! slight not the present—the past is arrayed
In a dim and indefinite mantle of shade;
Disturb not the calm of its mist-covered plains,
Where glide the pale ghosts of lost pleasures and pains.

The future! what mortal may pierce its thick
cloud!

The future is wrapped in uncertainty's shroud;
Dark trials, keen cares, from that shroud may
arise,

Or its secrets may ne'er be disclosed to thine eyes.

The present! oh! wish not its moments away;
A talisman dwells in the might of to-day;
Past seasons are buried, the future unknown,
But the bright sunny present, at least, is thine
own.

I seek not, like vain thoughtless minstrels, to sing
Of the blossoms and warmth of life's beautiful
spring;

I woo thee not lightly, to while the fleet hours
In numbering sunbeams, and gathering flowers.

No! fain would I bid thee from knowledge im-
plore

Each day some new treasure to add to thy store;
And gently some service or kindness impart,
To glad the worn fortune, or soothe the sad heart.

Each day may thy home and its fondly-loved ties
Acquire fresh attraction and worth in thine eyes;
Yet with strengthened devotion on God may'st
thou call,

And feel that for Him thou could'st part from them
all.

Thus live, and thou wilt not in weariness cast
Thy glance from the present to picture the past,
Nor marvel what earth's mystic future may be,
Since Heaven hath in store a bright future for
thee.

Metropolitan.

BEATRICE.

With drooping eyes and drooping curls,
And drooping feather, large and white,
Proudest yet gentlest of sweet girls,
She stands beneath the evening light.

And o'er her lovely face the while,
The lingering hues of dreamy thought
Have stolen away the playful smile,
Which day and lively hours had brought.

For she hath left the jesting throng
Of friends, to feed her pensive mood,
Where leaves and streams are at their song,
In a green summer solitude.

And quiet as the scene around,
The maiden stands—with placid face,
Her dark eyes bending on the ground;
Ah! would she lift them up a space.

But no—she moveth slowly on;
She will not smile—she will not look;
For she into herself hath gone
Too deep our company to brook.

Go, lovely Beatrice, and seem
Unto thy friends like thy sweet face
To us: a thoughtful poet's dream
Of woman's dignity and grace.

Metropolitan.

From the Athenæum.

United States Exploring Expedition. 5 vols.
Wiley & Putnam.

THE second volume of this important work has now come to hand. As the first scientific expedition fitted out by the United States, we felt from the first, and continued to feel, the sincerest interest in its progress and results. In rendering an account of both, we are desirous, indeed, of abstaining from criticism, and, considering the adventure as a virgin experiment, to treat it with consideration and respect. We shall, therefore, take the account substantially as it stands, and give to the commander the benefit of his own position.

We find our explorers, at the opening of this volume, in sight of Tahiti, and are soon called upon to witness their arrival and reception. Nor is there any delay in commencing operations. An observatory, furnished with both astronomic and magnetic instruments, is at once established, and parties are sent out for the survey of the principal harbors and the intervening channels. A large body of officers and naturalists were also sent across the islands to visit Orohena, one of the highest peaks, and lake Waihera. They could not, however, reach the desired spot, but some days afterwards Captain Hudson, with his officers, succeeded in measuring the elevation of Aorai, the peak which is next in height to Orohena. This he found to be 6,979 feet; Orohena appeared to be about 1,500 feet higher. From these two peaks, ridges descend to all parts of the coast; they are precipitous and narrow, their summit being often a mere edge, where walking is not only dangerous but sometimes impossible. Here, too, we meet with the American and French Consul, and with Mr. Pritchard. The following passage introduces us to another important personage:—

"The governor of the district of Matavai, Tauga, was the first acquaintance of any distinction that we made. He had already visited the Vincennes on her anchoring. He is a fine-looking man, of huge proportions, and has a large establishment near Point Venus, where he monopolized nearly all the washing, which was performed by his numerous dependents. By this business he derives some remuneration for the cost of feeding and clothing them, putting the gains of their labor into his own pocket. Such, at least, is his own account of the transaction. Tauga's usual dress was a striped cotton shirt, nankeen pantaloons that had once been yellow, and a round jacket of blue cloth. Both shirt and pantaloons were too tight, and he had neither suspenders nor stockings, although he wore shoes. In this guise he had an awkward look, which he probably would not have exhibited in a native costume. He was profuse in offers of hospitality at his own house, and many of the officers were induced to accept his invitations. His entertainments appear to have been of the same general character with that to which I was treated, and which will, therefore, serve as a specimen of the mode in which such things are done by the 'good society' of Tahiti. We reached his dwelling in time to see the preparations for the feast. These were entrusted to his man of all work, Stephen, or as he called him, 'Stiffin.' This useful personage exhibited his dexterity, not only in cooking, but in killing the poultry. The bird selected was a cock, for the Tahitians well understand the difference in value between it and the hens; and Stephen exhibited much adroitness in

the slaying, plucking, and dressing. While this was going on, the stones for the Tahitian oven, so often described by voyagers, were heating, and when they had acquired the proper temperature, the ashes were carefully swept off—bread-fruit, taro, and plantains, wrapped in leaves, were then laid on the stones, with the fowl in the centre, and the whole covered up. In about an hour the oven was carefully opened, the contents exposed, and found to be thoroughly cooked. The dinner was then served in an earthen dish, with a knife and fork, when, although the fowl was somewhat tough, it was greatly relished. The dinner hour was one o'clock. Tauga, according to the universal opinion of the squadron, did not improve upon a closer acquaintance. His intrusive and greedy disposition, not to mention his fondness for the bottle, rendered him daily a less welcome visitor than at first. I must, however, do him the justice to say, that if he were wanting in other traits of character that ought to distinguish a chief, he did the honors of his house admirably, and that he must be seen in the capacity of a host, if a favorable opinion is to be formed of his character."

Honorable mention is made of Mr. Pritchard and his mode of conducting the schools; there are, indeed, few natives who cannot both read and write, even those advanced in years. The account of the island is altogether favorable, and so is the testimony borne to the utility of the missionaries. The latter, however, are subject to some animadversion:—

"Although much has been done for the improvement of the natives, still it appears evident that much more might have been done if the missionaries had not confined themselves so exclusively to teaching from the Scriptures. The natives, by all accounts, are extremely fond of story-telling, and marvellous tales of their ancestors and ancient gods, are even now a source of amusement. The missionaries, as I am told, possess much information in relation to the history and mythology of the island, embodied in the superstitious tales still occasionally current among its inhabitants. It is to be hoped that they will preserve a record of these, before they are obliterated by their exertions to destroy the ancient superstition. But they would have succeeded sooner in eradicating the practice of reciting these legends, had they provided a substitute in works of fiction, inculcating moral or religious lessons, or teaching useful knowledge. So also, while it was indispensable to put down those amusements which were the means or incentives to debauchery, this measure ought to have been accompanied by the introduction of innocent modes of recreation. For want of the first resource, much time is now spent in unmeaning gossip, and the necessity for the other is often shown in a listless idleness. No attempt has been made by the missionaries to introduce the mechanic arts, or improvements in agriculture, yet it cannot be doubted, that to have taught them even the simplest of these, would have materially aided the progress of civilization, and reacted favorably upon that of religion. The failure of a cotton manufactory, with expensive machinery, which was erected on the island of Eimeo, affords no argument against the probable success of less complex arts. The natives were not prepared to pass at once from habits of desultory exertion, to the regular and stated occupation of the mill. But the spinning-wheel, the hand-loom, and the plough, would not have re-

quired such a decided change in the number of hours of labor, and would have served as a preparation for more continuous industry. The two former implements have at length been introduced by other hands, and have already been adopted with eagerness by some of the natives. The change of dress which has been introduced by the missionaries and other foreigners, has, on the contrary, had an injurious effect on the industry of this people. While they wore their native tapa, the fabric, though of little value, gave employment to numbers of women; and this change of dress, though intended as an advance in civilization, has had the effect of superseding employments which formerly engaged their attention, and occupied their time. The idleness hence arising, and the artificial wants thus created, have no little influence in perpetuating licentiousness among the females, to whom foreign finery is a great temptation. The European dress, at least as worn by them, is neither as becoming, nor as well adapted to the climate as that which it has almost superseded. Many of the missionaries now see these things in their true light, and informed me that they were endeavoring to pursue a more enlightened course."

We shall now follow our explorers to the harbor of Papieti. There the commander invited the great chiefs on board:—

"The ship was dressed for the occasion with flags, and they were received with every mark of respect. Luncheon was prepared for them; and when they were all seated at it, it struck me that I had never seen such a collection of corpulent persons. Previous to eating, one of the oldest chiefs said grace. Their appetites were good; none of the food appeared to come amiss. They seemed heartily to enjoy themselves, and conducted themselves with a propriety that surprised us all. They were cautious in partaking of the wine which was set before them, and seemed evidently upon their good behavior. This was the case with the high chiefs, who, to the number of about fifteen, had been invited; but, besides these, about an equal number of others contrived to get on board without invitation; the latter thrust themselves forward with eagerness to occupy places at the table, but were compelled to give place to those of higher rank. A second table was, however, prepared for them, at which they took their seats, and did ample justice to what was set before them. The variety of costume which was exhibited at this banquet was amusing. The princesses were dressed in white frocks, shoes and stockings, and chip bonnets, but looked awkwardly in them, and appeared more like boys in girls' clothes than women. Some of the men wore full suits—coats, vests, and pantaloons—of a variety of colors; others had sailors' round jackets; others again had only shirts and pantaloons, all too small, both in breadth and length. Some had black felt hats, of all possible fashions, and others wore them of straw; some had shoes on their feet, others had none. Paofai's son attracted attention by his ridiculous appearance: he wore a red check shirt, light white pantaloons, that reached only half way down his legs, coarse shoes without stockings, and a short-skirted drummer's coat of blue, plentifully faced with scarlet. The latter was so small for him, that no force would make it button upon him. To finish all, he had a high-crowned conical felt hat stuck upon the top of his head."

Another attempt was made to reach the top of

Orohena, by Dr. Pickering and Mr. Conthouy. By nine o'clock in the morning they had, after a walk of about six miles, attained a higher point than any on their former journey, about 3,500 feet:—

"When they had reached the altitude of fifteen hundred feet they no longer found any paths; on arriving at this point, they halted for some time to make collections of land-shells, and some very interesting specimens were obtained of *Helices*, *Patulas*, *Cyclostomas*, *Curocollas*, and *Pupas*; after this they continued ascending, the ridge gradually becoming narrower, until they reached a spot on the ridge where there was not room for one person to pass by another, and where they could look down a precipice on each side to depths of two thousand feet. Plants that were below of small size here grew into large woody shrubs: among them a species of *Epacris* was found growing luxuriantly along the crest of the ridges, and magnificent arborescent ferns on the mountain sides, some of them forty feet in height; another species was seen whose fronds were more than twenty feet in length. Their path was much impeded by the tangled ferns and wiry grass (*Gleichenia*) which it was impossible to get through without the aid of a knife or a hatchet. They had now reached four thousand five hundred feet, the highest point yet attained, according to the guide, by white men; two o'clock had arrived, and as there was no place where they could encamp, or any chance of reaching a point suitable for passing the night in, by the advice of Vahaore [their guide] they allowed him to look for one. The mountain top was still estimated to be six miles distant; they had little doubt that it could be ascended by following the ridge, and it was thought that they could accomplish the task if time permitted. The day was fine, and they enjoyed a view of the whole mountain, which appeared as if it were the centre, from which the different ridges of the island radiate in ten or twelve directions towards the coast, having deep and narrow valleys between them, through which the mountain torrents rush; these valleys spread out as they approach the coast, and the ridges become more rounded and accessible. After reconnoitring the ground for some time, Vahaore recollected a place where they might pass the night, which he thought was not far distant. He therefore immediately began to break a road, which he continued for about a quarter of a mile along the ridge. He then reached a place where the descent might be made, which, however, to all appearances, presented as few facilities for the purpose as any they had before looked at. They, however, tried it, and after a hard scramble reached, about sunset, the place he sought. The descent was estimated to be about two thousand feet, and was performed partly by leaping from tree to tree, and partly by lowering one another by ropes over precipitous ledges from ten to twelve feet in height. In the words of Sacket, 'No man in his senses ever went down such a place before, and none but a fool would attempt to do so again.' At the foot of the descent lay the first valley, and they found themselves among groves of the wild banana (*fahies*.)"

It having been determined to make a thorough examination of the group of the Samoan Islands, Tutulia, as the most central, was selected for their station:—

"The men of Tutulia, are a remarkably tall,

fine-looking set, with intelligent and pleasing countenances. In comparison with the Tahitians, they would be called sedate. The women are far from being good-looking, with the exception of some of the younger ones. They are remarkably domestic and virtuous, exhibiting a strange contrast to those of Tahiti. Here there is no indiscriminate intercourse; the marriage tie is respected, parents are extremely fond of their offspring. The inhabitants are disposed to be hospitable to strangers, although they expect remuneration for it. Travelling is generally believed to be safe throughout the island of Tutuila, and the natives, as far as our experience goes, are not the blood-thirsty race they have been reported to be. The unfavorable estimate of their character has, I presume, been derived from those who first knew them, and particularly from their attack upon the expedition of La Perouse. Of this conflict I obtained the following particulars from the Rev. Mr. Murray, who had them from an old man, who was a witness of the affray. The latter is the only individual now alive in the settlement who was present when it occurred, and his testimony was corroborated by others who had heard of it from those who witnessed the scene. On the morning of the massacre, the vessel stood in towards the land. About noon the boats went ashore, as recorded by La Perouse, and while on shore, a number of canoes, belonging to the island of Upolu, (to which Tutuila was at the time subject,) went from the shore, and proceeded directly to the vessels. When these canoes were alongside, a young man in one of them laid his hand on an iron bolt in some part of the ships, with the intention, it was supposed, of stealing it. He was fired upon by the French. The ball passed through his shoulders, and mortally wounded him. The natives, on seeing the effect of the shot on one of their number, were greatly enraged, and immediately left the vessels, and hastened to the shore, where they found the boats that had gone to get water. On reaching them, they began the attack, which resulted in the massacre of M. De Langle, and of those who were with him on shore. When the natives began this attack the great body of the French were absent from their boats; some were in the bushes gathering plants, and others talking to the females. On the commencement of the disturbance, they all rushed towards their boats, and the confusion became general. The minute circumstances of the affray, farther than the above, cannot now be ascertained from the natives. They are, however, very clear in reference to the cause, and to those who were the actors in it, viz., the natives of Upolu. The Tutuilians maintain that they endeavored to save the lives of the French; and, on the following day, as soon as they dared to venture from the mountains, whither they had fled during the massacre, they collected the bodies, which they found in a state of nudity, dressed them in native cloth, and buried them in the beach, as they were accustomed to bury their own chiefs. The actors in the massacre proceeded at once to Upolu, which will account for their having been afterwards seen there, and recognized by the French. Our inquiries relative to the spot where they had buried the bodies, were not satisfactorily answered. How the carpenter's son escaped is not known. He is said to be still living at a village on the eastern part of the island. There appears to be mention made of a boy among the missing, in La Perouse's account. Levasii, a chief

of the district of Faleletai, was at the massacre of the party of La Perouse. He was then a boy of thirteen years of age. He remembered the occurrence, and that three of the Papalangi were killed. The perpetrators of the deed were some young chiefs from the district, who were on a 'malanga' to Tutulia. At that time Aana district had the rule, or was the 'Malo' party, and domineered over the inhabitants of the other islands and districts."

The following incident, which took place at Upolu, is suggestive:—

"At noon we descried the Peacock lying in the harbor of Apia, and shortly afterwards I received a message from Captain Hudson, saying that my presence was required on shore. In the hope that it was not a business of such a nature as to cause detention, I left the Vincennes in the offing, while I went ashore in my boat. On reaching the land, I found the chiefs engaged in the trial of a native called Tuvai, who had killed an American named Edward Cavanaugh, a native of New Bedford. It appeared that on Captain Hudson's arrival the murderer was pointed out to him in the village, upon which he very properly determined to have the offender punished, and gave orders to have him arrested. He was in consequence seized in a house near the water, and carried on board the Peacock. Being taken by surprise, he offered no resistance to his capture. Captain Hudson then requested a conference with the neighboring chiefs, who in consequence had assembled on the 27th. The fono, as such assemblies are called, was held in the council-house, or fale-tele, where the chiefs were collected. The Rev. Mr. Mills acted as interpreter on the occasion. Captain Hudson, through him, stated that the object of his having requested them to assemble was to bring the accused to a trial before them, in order that if his guilt were established, he might be brought to condign punishment: he then pointed out to them the guilt and consequences of the crime of murder, and declared the course he had considered it his duty to adopt. The chiefs listened attentively to this address, and in reply, through the principal one, admitted that the man taken was in reality the guilty person, a fact known to every person upon the island. Captain Hudson then stated to them that it was absolutely necessary that Tuvai should be promptly punished, in order that others might be deterred from the commission of the same crime. He suggested, however, that in spite of the universal belief in Tuvai's having committed the crime, it was proper that he should undergo a trial, or at least an examination, in order that he might have the privilege of being heard in his own defence. This suggestion being approved, Tuvai was brought on shore under a military guard, and placed in the centre of the building. He was an ill-looking fellow, of about twenty-eight years of age, and manifested no fear, but looked about him with the greatest composure. The trial was simple enough; he was first asked by the chiefs whether he was guilty of the crime, to which he answered that he was; being next asked why he had committed it, he replied that he had done it in order to possess himself of the man's property (clothes and a knife.) The chiefs, among whom was Pea, of Apia, to whom the criminal was distantly related made every effort in their power to save his life: stating that he was in darkness, and therefore unconscious of the guilt of the action, when he committed the murder; that as they had

but just emerged from heathenism they ought not to be subjected for past actions to laws they knew not; that these laws were made for people who occupied a more elevated station; that Tuvai was a poor man of no account, and was not a person of sufficient importance to be noticed by a great people like us; that faa Samoa (the Samoan fashion) did not allow men to be put to death in cold blood, but that after so long a time had elapsed, as in the instance before them, it admitted of a ransom. Pea went on to say, that many bad acts had been committed upon natives by white men, with impunity, and asked whether the Christian religion sanctioned the taking of human life. He then appealed to our generosity to pardon the present crime, and assured us that no such offences should be committed in future. Pea had one of those countenances which exhibits all that is passing in the mind. It was amusing to see him at one time exhibiting a picture of whimsical distress at the idea of being compelled to put his kinsman to death, and immediately afterwards laughing at something ludicrous which had occurred to him. Pea was seconded in his endeavors by Vavasa, of Manono, one of the finest-looking of the chiefs, whose attitudes and movements were full of grace, and his manner exceedingly haughty and bold. In reply to their arguments, Captain Hudson stated, that however freely other sins might be forgiven, in consideration of their late benighted state, even the darkness of Paganism could not extenuate the crime of murder. He told them the Scriptures said, 'Whoso sheddeth man's blood, by man shall his blood be shed;' that nothing but the life of the offender could satisfy the demands of justice, and that they must execute the criminal themselves. This announcement caused much excitement; the chiefs again asserted that they knew no such laws; that by the customs of Samoa, the anger of the friends and relations of a person who had been killed was to be appeased by a present from the criminal or his relations, and by a form of submission, which consisted in knocking their heads three times on the ground. To this it was replied, that the guilt of the prisoner had been proved and admitted—he must die. The chiefs, after much reluctance, consented, but expressed great repugnance to an immediate execution. They urged in the most strenuous manner, that the criminal should be carried on board ship, and executed there, or that he should be taken to some uninhabited island and left. These alternatives were refused by Captain Hudson, and the chiefs seemed in great distress. At this point of the discussion, the Vincennes was announced as being in sight, and the proceedings were suspended. An officer was immediately despatched, who, as has been already mentioned, boarded that vessel off the harbor. When I landed, I found the assembly anxiously awaiting the result of my arrival. Captain Hudson and myself had a private interview, in which he detailed all the facts, and stated that it had been his intention to compel the chiefs to make all the preparations for the execution, but before it was carried into effect to come forward and relieve the criminal, at the same time requesting Mr. Mills to make an appropriate speech, stating the reasons for the pardon. After a full discussion of the whole subject, we came to the conclusion, that it would be best to transport the criminal to some other island; for it appeared probable that this would have a better effect than even his execution, as it would be longer remembered, while to cause him to be put

to death might naturally excite a desire of revenge. This decision was at once communicated to the chiefs, with a statement, that in conformity with the laws of Tahiti in such cases, Tuvai should be transported to a desert island where he would never again have an opportunity of killing a white man. The chiefs, though evidently relieved from the most intense part of their distress, were still much affected by this decision. The prisoner was then ordered to be taken on board the Peacock, whither he was followed by a crowd of natives, with many tears and lamentations, among whom his wife was the most affected. Among others, Pea, the chief of Apia, to whom, as has been stated, the prisoner was related, was very much distressed and excited. Unable to vent his rage and trouble in any other manner, he spent it upon the crowd around him, striking in all directions with a huge stem of a cocoa-nut leaf, by which he soon dispersed them. I felt a curiosity to see what effect the sentence would have upon the prisoner. Death he would have suffered without uttering a murmur; but when he heard he was to be taken from his native land, his firmness was overcome, and he was observed to shed tears. He made no resistance to his being removed on board ship, but after he got there he said he would rather be put to death and buried in his own native island, than banished to a desert one. After this difficult business was arranged, they brought their own grievances before me, and particularly their complaints against the American whalers. They said that some of them had evaded their port-charges, and refused to pay for the provisions with which they had been furnished. To this I replied that I was ready to indemnify them for their losses, and should ask no other proof of them than their own statement. They appeared struck with the unexpected liberality of this offer; but, after consultation, as if to manifest a corresponding feeling, declined to accept it. I then informed them that their port-charges for the squadron should be paid, which gave much satisfaction, particularly to old Pea, who would derive the principal benefit from them. The fono then broke up in great good humor. Pea and some of the other chiefs were very anxious to hear from me what sort of an island Tuvai was to be put upon. They asked many questions in relation to it, and always among the first, whether there would be any cocoa-nut trees, Nature's first and best gift to them, upon it. Wishing to make the intended punishment as terrible as possible to them, I always replied that there would be none whatever. After Tuvai was again on board ship, old Pea paid him a visit, in the course of which the former melted into tears, howled bitterly, and begged that he might be taken on shore to be put to death, in order that his body might be buried in his native soil. It appeared from information that we received, that this was a part of a concerted plan to obtain a farther commutation of his sentence, and that this affecting interview was got up in order to excite our sympathies. Finding it did not produce the desired effect, old Pea went about the ship with a doleful visage, exclaiming, 'Eoloia-ia-tu-Tuvai'—have compassion on Tuvai."

As we proceed with the volume before us, we are constantly provoked to be critical; but shall, except on one topic, persevere in our original intention, of giving the commander the unquestioned benefit of his own statements. Our next extract is of a legendary character:—

"Messrs. Dana and Couthouy visited a lake

called Lauto, which lies to the westward of this pass, and in the centre of an extinct crater. The edge of the crater was found to be two thousand five hundred and seventy feet above the sea, and the descent thence to the water of the lake is one hundred and twenty feet. These gentlemen succeeded in obtaining a line of soundings across the lake, by cutting down trees, and forming a raft of them. They found the depth, in the middle, nine and a half fathoms, decreasing thence gradually in all directions to the shore. The form of the lake is nearly circular, and it has a subterranean outlet. The hill in which this crater is situated is conical, and there is a low knoll at some distance to the south of it, which is the only other elevation in the neighborhood, above the general height of the ridge. The border of the crater is clothed with the usual forest foliage of these islands, which, however, exhibits here more than usual beauty, being decorated with the finely-worked fronds of the arborescent ferns, in widely-spread stars, and the graceful plumes of a large mountain palm. The poets of the island have appreciated the beauty of the place, and allude to the perpetual verdure which adorns the banks of the lake, in the following line :

Lauto'o e le toi a e lau mea.
Lauto, untouched by withered leaf.

There is a legend connected with this lake, that has more of poetic beauty and feeling than one would have supposed to exist among so rude a people. It is as follows. Many generations since, during a war between Upolu and Savaii, a number of war-canoes, from the latter island, crossed over to attack Ulatamoa, (or, as it is now called, Ulu-moenga,) the principal town in the district of Aana. At the time of their approach, two brothers, To'o and Ata, chanced to be paddling their canoes in the channel between the reef and the shore, and before they could reach the land, were attacked by a party of Savaiians. After a valiant defence, Ata was overpowered and slain, while To'o narrowly escaped the same fate. Overwhelmed with sorrow at the loss of a brother whom he tenderly loved, To'o retired to a neighboring mountain, and burying himself in the darkest recesses of its forests, made them resound with his bitter lamentations. At length, in his wanderings, he came to the summit, where, stooping down, he scooped out with his hands a vast hollow, and, leaning over its brink, suffered his tears to fall in until it was filled. The lake thus formed, has ever since borne the appellation of Lauu-to'o. The regard of To'o for his brother was further evinced by his adoption of Ata's name, conjoined to his own, as his family title, and the appellation of Teoomata, a contraction of To'o-ma-ata, is retained by his descendants, who are still chiefs of note in Upolu, and from whom the tradition was derived. The lake of Lauto is regarded with superstitious dread by the natives, who believe it to be the abode of the spirits, who, in former times, were regarded with great veneration, and worshipped. These were supposed to inhabit the waters of the lake, in the shape of eels, as thick as a cocoa-nut tree, and two fathoms long. The attempt of our gentlemen to explore it, was looked upon as such a profanation, that their native guides left them, and regarded them as persons doomed to accident, if not to destruction. The eels were represented as so savage and fierce, that they would bite a person's leg off.

No eels, however, nor any other fish, were seen in the lake."

We have also an account of a new faith :—

" In the different jaunts across the island, many of the 'Devil's,' or unconverted, towns were visited, where our parties were always treated with great hospitality. At the town of Siusinga, the chief who entertained our party was a priest of the *Gimblet* religion. This new faith has made some progress among these islands, and has the following singular origin : A native of Savaii, by name Seeovedi, was taken from that island by a whale-ship, and did not return for several years. During his absence he visited several ports, where it would seem he obtained some notions of the forms and ceremonies of the Roman Catholic church. Possessed of considerable natural shrewdness, he founded on this knowledge a plan to save himself from labor for the future, by collecting followers at whose expense he might be maintained. During his absence, and while on board the whale-ship, he had received, as is usual in such cases, instead of his native name, that of Joe Gimblet ; and this cognomen is now firmly attached to the sect of which he was the founder. Having formed the plan of founding a sect, he did not scruple as to the means of carrying it into effect ; for he boldly claimed a heavenly mission, professing to hold converse with God, and asserting that he possessed the power of working miracles, raising the dead, &c. He soon gained many proselytes, and had attained great consideration and authority, when, unfortunately for him, he was called upon to exert his pretended power of raising the dead, by restoring to life the favorite son of a powerful chief called Lelomiava, who had been murdered. Joe did not hesitate to undertake the accomplishment of this miracle. He, in the first place, directed a house to be built for the reception of the body, and when it was finished, he required that it should be supplied with the best provisions. In conformity with this requisition, the choicest articles of food that could be obtained were regularly handed to Joe for the use of the defunct, upon whom he alone waited, while every other person, except the chief and himself, was excluded from the building. The food thus regularly supplied, as regularly disappeared, and Joe assured the chief that his son had eaten it, and, under this bountiful allowance, would soon recover his strength, and walk forth. In this way time wore on, until the patience of the old chief began to show symptoms of being exhausted. This somewhat alarmed Joe ; but as he was a fellow of infinite resources, he contrived to evade inquiry and procrastinate, hoping, no doubt, that some lucky incident might turn up, by which he should be enabled to extricate himself from the dilemma. Unfortunately for him, however, after another month of anxious suspense, the old man's pigs and taro fell short, notwithstanding the chief's dependents had for a long time been restricted from using them. All of them were in fact much reduced by their compulsory fast, with the exception of Joe, whose rotundity of form seemed to indicate that he at least ran no risk of starvation. Whether it were owing to the suspicions which his jolly appearance excited, or that he began to entertain doubts of Joe's supernatural powers, is not known ; but one day old Lelomiava determined to satisfy himself of the progress making in the restoration of his son. With this design he entered the house, and was shocked with the sight of his son's body in a state of loathsome putridity.

He immediately summoned Joe, and informed him that it was time that the promised miracle should be accomplished adding, that it must be done by morrow's dawn. Joe immediately redoubled his exertions, and prayed hastily to all the saints of his calendar. He, however, knew full well what would be his fate if he remained to encounter on the morrow the anger of the savage chief. He therefore effected his escape during the night, and made his way to his native island. There he remained, for some time, incog., but now ventures to appear openly, practising his impositions boldly, and is the worst antagonist the missionaries have to deal with. This story was related by the old chief himself, who, instead of finding his son restored to life, was compelled to bury his body, which he did, with the exception of the head. This he put in a box, and suspended beneath the peak of the roof of his house, where it remains, a witness of his credulity, and of the gross imposition that was practised upon him. While the party remained at Siusinga, a sick native was brought from the coast to a neighboring house, and their host, the Gimblet priest, was called upon to pray for him. This afforded them an opportunity, that might not otherwise have occurred, of learning some facts in relation to the ceremonies of this sect. On this occasion, the priest approached the house where the sick man lay, and when upon the stone platform, in front of it, he drew forth a book from the folds of tapa in which it had been carefully enveloped. He then called upon Jehovah, returning thanks for the many blessings which had been conferred on his people, and asked for a continuance of the same, invoking the name of Jesus. He ended by inquiring the divine pleasure concerning the sick man, and begging mercy for him. The nature of the book could not be distinctly seen, as it was again carefully enclosed in the tapa as soon as the ceremony was over; but so far as it was visible, it bore an unquestionable resemblance to a blank note-book! The proselytes of this sect, in case of sickness, confess their sins to one another, and have a number of fast-days, which are rigidly kept. Their Sabbath occurs only once a month, and is celebrated by the firing of guns, and the puerile mummery in which their worship consists."

The work contains an elaborate chapter on the Samoan group, which, though interesting, is too long for quotation and incapable of analysis. On arriving at Wallis Island, they landed there the prisoner Tuvai, conceiving that their purpose would be thus sufficiently answered; since the course of the wind is such, for the greater part of the year, as to prevent canoes proceeding from Wallis Island to the Samoan group, and on that account his fate would remain a mystery to his countrymen. New South Wales is now too familiar to present much novelty; the following account, however, of the natives is marked with some traits which distinguish it from others:—

"The natives of New South Wales are a proud, high-tempered race: each man is independent of his neighbor, owning no superior, and exacting no deference; they have not in their language any word signifying a chief or superior, nor to command or serve. Each individual is the source of his own comforts, and the artificer of his own household implements and weapons; and but for the love of companionship, he might live with his family apart and isolated from the rest, without

sacrificing any advantages whatever. They have an air of haughtiness and insolence arising from this independence, and nothing will induce them to acknowledge any human being as their superior, or to show any marks of respect. In illustration of this, Mr. Watson, the missionary, is the only white man to whose name they prefix 'Mr.,' and this he thinks is chiefly owing to the habit acquired when children under his authority. All others, of whatever rank, they address by their Christian or surname. This does not proceed from ignorance on their part, as they are known to understand the distinctions of rank among the whites, and are continually witnessing the subservience and respect exacted among them. They appear to have a consciousness of independence, which causes them, on all occasions, to treat even the highest with equality. On being asked to work, they usually reply, 'White fellow work, not black fellow;' and on entering a room, they never remain standing, but immediately seat themselves. They are not great talkers, but are usually silent and reserved. They are generally well-disposed, but dislike to be much spoken to, particularly in a tone of railery. An anecdote was mentioned of a gentleman amusing himself with a native, by teasing him, in perfect good-humor, when the man suddenly seized a billet of wood, threw it at him, and then in a great rage rushed for his spear. It was with great difficulty that he could be pacified, and made to know that no insult was intended; he then begged that they would not talk to him in that manner, as he might become wild and ungovernable. They look upon the whites with a mixture of distrust and contempt, and to govern them by threats and violence is found impossible. They are susceptible of being led by kind treatment, but on an injury or insult they immediately take to the bush, and resume their wandering habits. They do not carry on any systematic attacks, and their fears of the whites are so great, that large companies of them have been dispersed by small exploring parties and a few resolute stockmen. Though they are constantly wandering about, yet they usually confine themselves to a radius of fifty or sixty miles from the place they consider their residence. If they venture beyond this, which they sometimes do with a party of whites, they always betray the greatest fear of falling in with some Myall or stranger blacks, who they say would put them to death immediately. Their great timidity has caused a false estimate to be put upon their character, by ascribing to it great ferocity; and, as an instance of it, it is mentioned, that if a party of natives be suddenly approached in the interior, who are unacquainted with white men, and taken by surprise, supposing that they are surrounded and doomed to death, they make the most furious onset, and sell their lives as dearly as possible: this arises from the panic with which they are seized, depriving them temporarily of reason. They have not, properly speaking, any distribution into tribes. In their conflicts, those speaking the same language, and who have fought side by side, are frequently drawn up in battle-array against each other, and a short time after may be again seen acting together."

But though New South Wales presents little novelty to us, it does to the American in the United States, and accordingly the commander values highly the information which he has ob-

tained. He enters into a full account of its history and government, and testifies to its progress. The district of Illawarra in particular he states to be very prosperous. A Mr. Plunket is said to have sold his farm for £14,000, which but two years before, he had bought for £700. We fear, from the last reports received from the colony, that Mr. Plunket might have his estate back again, or take his choice amongst his neighbors' without expending one quarter the sum thus realized.

The volume concludes with observations made during the Antarctic cruise of 1840 and an account of New Zealand; with the latter we are already sufficiently familiar. But we cannot pass by the cruise, technical as the chapter is, without observing that, although in a mitigated form, the commander still assumes the existence of an Antarctic Continent; nay, he gives an engraved illustration of it as something actually visible. The account in the text follows:—

"Feb. 13. At 9 A. M. we made sail to the southwest, in order to close with the barrier, which we found retreated in that direction, and gave us every prospect of getting nearer to it. Our course, for the most part, was through icebergs of tabular form. In the afternoon we had the land ahead, and stood in for it, with a light breeze until 6 P. M., when I judged it to be ten or twelve miles distant. It was very distinct, and extended from west-southwest to south-southeast. We were now in longitude $106^{\circ} 40' E.$, and latitude $65^{\circ} 57' S.$; the variation was $54^{\circ} 30'$ westerly. The water was very green. We sounded in three hundred fathoms, and found no bottom. The weather having an unsettled appearance, we stood off to seek a clearer space for the night. The land left was high, rounded, and covered with snow, resembling that first discovered, and had the appearance of being bound by perpendicular icy cliffs.

"14. At daylight we again made sail for the land, beating in for it until 11 A. M., when we found any further progress quite impossible. I then judged that it was seven or eight miles distant. The day was remarkably clear, and the land very distinct. By measurement we made the extent of the coast of the Antarctic Continent, which was then in sight, seventy-five miles, and by approximate measurement, three thousand feet high. It was entirely covered with snow. Longitude at noon $106^{\circ} 18' 42'' E.$, latitude $65^{\circ} 59' 40'' S.$, variation $57^{\circ} 05'$ westerly. On running in, we had passed several icebergs greatly discolored with earth, and finding we could not approach the shore any nearer, I determined to land on the largest ice-island that seemed accessible, to make dip, intensity, and variation observations. On coming up with it, about one and a half mile from where the barrier had stopped us, I hove the ship to, lowered the boats, and fortunately effected a landing. We found embedded in it, in places, boulders, stones, gravel, sand, and mud or clay. The larger specimens were of red sandstone and basalt. No signs of stratification were to be seen in it, but it was in places formed of icy conglomerate, (if I may use the expression,) composed of large pieces of rocks, as it were frozen together, and the ice was extremely hard and flint-like. The largest boulder embedded in it was about five or six feet in diameter, but being situated under the shelf of the iceberg, we were not able to get at it. Many specimens were obtained, and it was amusing to see the eagerness and desire of all

hands to possess themselves of a piece of the Antarctic Continent. These pieces were in great demand during the remainder of the cruise. In the centre of this iceberg was found a pond of most delicious water, over which was a scum of ice about ten inches thick. We obtained from it about five hundred gallons. We remained upon this iceberg several hours, and the men amused themselves to their hearts' content in sliding. The pond was three feet deep, extending over an area of an acre, and contained sufficient water for half a dozen ships. The temperature of the water was 31° . This island had been undoubtedly turned partly over, and had precisely the same appearance that the icy barrier would have exhibited if it had been turned bottom up and subsequently much worn by storms. There was no doubt that it had been detached from the land, which was about eight miles distant. The view of the land, ice, &c., taken from this ice-island, is exhibited in the plate, and gives a correct representation of these desolate regions."

Now, certainly we have the words "Antarctic Continent" here used fluently enough—but the only things actually met with are icebergs and ice-islands. The land, too, is said to have been "very distinct;" but we shall soon find that this "very distinct land" is an object not of observation but of mere reasoning. To be sure, the argument is somewhat modified by the question thus tauntingly put by Lieut. Wilkes:—

"Who was there prior to 1840, either in this country or in Europe, that had the least idea that any large body of land existed to the south of New Holland! and who is there that now doubts the fact, whether he admits it to be a vast continent or contends that it is only a collection of islands?"

According to this, if what is now termed the Antarctic Continent should turn out to be only "a large body of land" or "a collection of islands," we must be content, and accept the American case as proved. So be it:—only let the precise statement be understood, and, we repeat, we are willing to give the commander the benefit of his own position. We must of course pass over the instances in which certain appearances were supposed to be indications of land; because these merely register individual opinions, requiring the after corroboration of actual discovery. It is our duty, however, to give the commander the benefit of the statement that these appearances were confirmed by the crew on one occasion finding soundings. Nevertheless, this can only form one item in the argument favoring the assumption of land existing—to say nothing of a continent. "Ice," Lieut. Wilkes asserts, "requires a nucleus, whereon the fogs, snow and rain may congeal and accumulate; this the land affords." As an hypothesis this is reasonable enough—but is not the discovery of an Antarctic Continent. The conclusions from this supposition are ingeniously deduced, and agree with the relative phenomena to a considerable extent; but the frequent and necessary use of the words "may be" shows that the whole matter was doubtful. Thus says Lieut. Wilkes—

"The icebergs found along the coast afloat were from a quarter of a mile to five miles in length; their separation from the land may be effected by severe frost rending them asunder, after which the violent and frequent storms may be considered a sufficient cause to overcome the attraction which holds them to the parent mass. In

their next stage they exhibit the process of decay, being found fifty or sixty miles from the land, and for the most part with their surfaces inclined at a considerable angle to the horizon. This is caused by a change in the position of the centre of gravity, arising from the abrading action of the waves."

On the whole, however, the commander is in favor of a continent; for he tells us in a note, that "the fact of there being no northerly current along this extended line of coast, is a strong proof in his mind of its being a continent instead of a range of islands." Here follow some other reasons for the same conclusion:—

"The evidence that an extensive continent lies within the icy barrier, must have appeared in the account of my proceedings, but will be, I think, more forcibly exhibited by a comparison with the aspect of other lands in the same southern parallel. Palmer's Land, for instance, which is in like manner invested with ice, is so at certain seasons of the year only, while at others it is quite clear, because strong currents prevail there, which sweep the ice off to the northeast. Along the Antarctic Continent for the whole distance explored, which is upwards of fifteen hundred miles, no open strait is found. The coast, where the ice permitted approach, was found enveloped with a perpendicular barrier, in some cases unbroken for fifty miles. If there was only a chain of islands, the outline of the ice would undoubtedly be of another form; and it is scarcely to be conceived that a long chain could extend so nearly in the same parallel of latitude. The land has none of the abruptness of termination that the islands of high southern latitudes exhibit: and I am satisfied that it exists in one uninterrupted line of coast, from Ringgold's Knoll, in the east, to Enderby's Land, in the west; that the coast (at longitude 95° E.) trends to the north, and this will account for the icy barrier existing, with little alteration, where it was seen by Cook in 1773. The vast number of ice-islands conclusively points out that there is some extensive nucleus which retains them in their position; for I can see no reason why the ice should not be disengaged from islands, if they were such, as happens in all other cases in like latitudes. The formation of the coast is different from what would probably be found near islands, soundings being obtained in comparatively shoal water; and the color of the water also indicates that it is not like other southern lands, abrupt and precipitous. This cause is sufficient to retain the huge masses of ice, by their being attached by their lower surfaces instead of their sides only."

Thus, notwithstanding the testimony of other navigators, and particularly that of Captain Ross, in relation to "great Southern Land" discovered by him, and extending from the 70th to the 79th degree of latitude, and that of D'Urville, the celebrated French navigator, in reference to a small point of rocks, called by him Clarie Land, and which the commander of the American squadron claims to have passed three days prior to the French landing—and, notwithstanding the apparent reasonableness of the supposition—we are compelled to report that so far as investigation has proceeded at present, the existence of the Antarctic Continent is only an hypothetical assumption, and that no claim to its discovery can be maintained by any party. It is only natural that a commander of his country's First Scientific Expe-

dition should wish to make the most of it; but science is so august in her nature, and so severe in her rules, that she declines recording in her archives any sentence as Truth on which there rests the slightest liability of doubt;—in all such cases she prefers the Scotch verdict, "Not proven."

From Chambers' Journal.

LIFE IN THE SEWERS.

Few who walk along the streets of London, and see mile on mile of carriage-way and foot-pavement stretching out before them, and branching off on every side, reflect upon the vast and wonderful schemes of sewerage that extends underneath. From the remotest district of London to the river, small sewers flow into larger ones; and these again, after a long course and many windings, into the Thames. Were a map executed of these subterranean currents, so intricate, yet so regular, like the large veins and arteries of the body, it would convey a grander idea of the civilization of the capital than even the magnificent streets, filled with the productions of the world, that extend above ground. Formed of substantial brick-work, well arched and secure, they represent a sunken capital which has been variously estimated at the enormous sum of from one million and a half to two millions sterling. It is an interesting sight when any one of the main sewers is under repair in a principal thoroughfare, to see how deep the excavation is, and how many lines of gas and fresh water pipes have to be traversed before the strong current of foul water, running in its capacious brick channel, is reached by the workmen. Several of these main sewers were open streams, meandering through the fields, before London became so gigantic as it is now; and among the number may be cited the Fleet, running from beyond Islington, through Bagnigge Wells, Clerkenwell, Fieldham, Holborn, and Farrington street, into the Thames, once capable, it appears, of bearing merchant vessels as far as Holborn; the Wallbrook running from Moorfields past the Mansion-House, and by the church of St. Stephen, Wallbrook, and by Dowgate, into the Thames; and the Lang or Long Bourne, which still gives name to one of the wards of London.

Any one who has walked over Blackfriars or Waterloo Bridge when the tide is down, may have observed men and boys, and occasionally women, walking upon the shores of the river, knee deep in the slime, with baskets upon their backs, or slung over their arms, picking up pieces of wood that have been left behind by the tide, or bits of coal that have fallen from the numerous coal barges that come up laden from the pool, where the collier vessels are moored, to discharge their cargoes at the wharfs further to the west. These "mud-larks," as they are sometimes called, bear generally a bad character, being accused of not contenting themselves with the prizes they find on the shore, but of robbing the coal barges or other vessels, on board of which they can creep at nightfall without detection. However this may be, their functions do not end with the shore, but in the sewer. With torch in hand, to preserve them from the attacks of numerous large and ferocious rats, they wade, sometimes almost up to the middle, through the stream of foul water, in search of stray articles that may have been thrown down the sinks of houses, or dropped through the loop-

holes in the streets. They will at times travel for two or three miles in this way—by the light of their torches, aided occasionally by a gleam of sunshine from the grating by the wayside—far under the busy thoroughfares of Cornhill, Cheap-side, the Strand, and Holborn, very seldom able to walk upright in the confined and dangerous vault, and often obliged to crawl on all fours like the rats, which are their greatest enemies. The articles they mostly find are potatoes and turnips, or bones, washed down the sinks by careless scullery-maids; pence and half-pence, and silver coins; occasionally a silver spoon or fork, the loss of which may have caused considerable distress and ill-will in some house above; and not unfrequently more valuable articles, which thieves, for fear of detection, have thrown down when they have been hard pressed by the officers of justice. It might be thought that a life amid the vilest filth, and amid so much danger and unpleasantness of every kind, would allure but few; but the hope of the great prizes sometimes discovered in this miserable way deprives it of its terrors, and all the principal sewers that branch into the Thames have their regular frequenters. Were it not that the tide gives them too little time for that purpose, they would extend their researches to the extremities of London; but two or three miles inland is the utmost bound of their peregrinations. Those who value their lives will not be tempted to extend their researches further, lest they should be drowned by the rising waters of the river.

About two years ago, these and some other particulars of their mode of life were first elicited in consequence of the following circumstance:—An old man who had long pursued this calling was suddenly missed. Every search was made for him by the few to whom he was known; and his wife and family, not without many fears that he had lost his way in the sewers, or had been surprised by the tide, and drowned in his efforts to escape, made anxious inquiries at every police office in London; but without receiving any tidings of his fate. Months elapsed, and his name was passing from the remembrance of all but those who had lost their husband and father by his disappearance, when a young man, passing with his torch up the Fleet, at nearly a mile distant from the place where it discharges itself into the Thames, was startled at seeing the figure of a man amid the darkness sitting at the junction of a smaller sewer with the main current of the Fleet. He shouted, but received no answer, and heard nothing but the rolling of the black and feid water, and the splash or squeak of the numerous rats which he had alarmed. Advancing nearer, he held the light to the face of the silent figure, and beheld the ghastly countenance of a skeleton. He was not a man of strong mind, and losing his self-possession in his horror, he stumbled against it and fell. His light was extinguished. His situation was now sufficiently awful; but the added horror of the total darkness recalled his startled faculties instead of scattering them entirely. He knew his way by the number of iron gratings at intervals above, and groped along cautiously, shouting as loudly as he could, to keep up his own courage, and to startle the rats from his path, lest he should tread upon one which would turn upon him and fasten on his flesh. Grating after grating was thus passed, and he heard the carriages rattling above whenever he came near, and at times the conversation of people. Once he stopped

under a grating, by the side of which an old woman sat at her apple-stall, and overheard her discourse with her customers, and was tempted to give the alarm, that he might be drawn up. This, however, would have been a work of time, and he therefore decided to go on. He proceeded accordingly, and arrived at the Thames without accident, and immediately informed his companions of the discovery he had made. It was surmised at once that the skeleton was that of the man who had been so long missing. Information was given to the police, and a constable was despatched to see the issue. He would not, however, venture up the sewer, but remained by the river side to await the return of the three "mud-larks" who went up with torches and a basket to bring out the remains of the dead man. They found, on reaching the spot, that the discoverer, in his fright, by falling against the skeleton, had overturned it from its sitting position. A skull, a mass of bones, with a few buttons, and a portion of his shoes, alone remained—his flesh and his attire having been devoured piecemeal by the rats. The remains were collected and brought out without accident. A coroner's inquest was held on the following day, and the identity was established by the buttons, the only means by which it could be proved. Of course it could never be known to a certainty how the life of this unfortunate being had been lost; but the general supposition was, either that he had been suffocated by foul air, or that he had been seized with a fit of apoplexy in that darksome sewer. The simple verdict, "found dead," was returned by the jury.

Such is the romance of common things; and such is one of the many marvels that lie around us and beneath us, observable only by those who are disposed to study the manners, the habits, and the struggles of the poor.

From Chambers' Journal.

THE ROYAL OBSERVATORY AT GREENWICH.

It is fair to suppose that but few persons in this country are ignorant of the existence of the institution whose name stands at the head of these columns. Some, during a visit to London, and while sauntering in Greenwich Park, may have seen its exterior. Others, again, have read of it in books of voyages, or seen the words printed in the margin of maps, as the point from which longitude is reckoned. But very few possess any definite ideas as to the nature of the operations carried on within it; of the patient watching, amounting to severe labor, in conducting the extensive, various, and delicate observations for which it has long been celebrated; or of their high importance in a scientific and commercial point of view.

These points are, however, ably elucidated in the annual report for the present year of G. B. Airy, Esq., the astronomer royal, which, while it explains the satisfactory state of the scientific proceedings, contains also some general notices that may enable the great body of readers to comprehend the more than national value of such an establishment.

It would not be out of place to give, before proceeding farther, a brief history of the building, which is erected on the top of a gravelly hill in Greenwich Park, on the site of the ancient tower built by Duke Humphrey in the reign of Henry VI., commanding a fine and impressive view over

the smoke-shrouded city, the flowing river alive with vessels, and the fertile plains of Essex. It was built by order of Charles II., who, with all his levity, seems to have been aware of the importance of science: the first stone was laid by Flamsteed, who had been appointed astronomer royal in August, 1675, and no delay took place in its completion and furnishing it with accurate instruments. By the words of Flamsteed's commission, he was directed "to apply himself with the utmost care and diligence to the rectifying the tables of the motions of the heavens, and the places of the fixed stars, in order to find the so-much desired longitude at sea, for perfecting the art of navigation." With what success this has been done, may be inferred from the remarkable words of Delambre, who, writing on the four volumes of observations by Maskelyne, astronomer royal at the commencement of the present century, observes, "that if by a great revolution, the sciences should be lost, and that this collection only were saved, there would be found in it materials sufficient to rear almost an entire new edifice of modern astronomy."

The whole establishment comprehends two principal buildings, one the observatory, the other the dwelling-house; the former is a low oblong erection, placed east and west, with four principal apartments on the ground floor, in which the most important observations are carried on; in one of these, which has a double sloping roof fitted with sliding shutters, for convenience in observing transits, is the transit instrument, eight feet in length, resting on two stone pillars, and interesting from having been used by the astronomers royal from the days of Halley. In an adjacent apartment is the magnificent mural circle by Troughton, which was placed on its stone pier in 1812, and although it has a diameter of nearly eight feet, such is the accuracy with which it has been constructed, that its position may be ascertained to the tenth of a second. In the other rooms are other circles, and a variety of astronomical instruments, as well as a library containing many scarce scientific books.

It is, however, beyond our province to attempt a description of the splendid and complicated instruments contained within the observatory, which we should scarcely succeed in making intelligible to the general reader; suffice it to say, that the establishment is supported at the expense of government, and is under the direction of the lords of the admiralty.

Astronomical time is not divided, like civil time, into two periods of twelve hours, but is counted regularly from one to twenty-four. Now, it is one of the most important objects in the duties of the observatory to find the *true* time; this is ascertained at Greenwich by accurate determination of the places of various stars, and their transit over the meridian. From these observations the mean solar time is computed; and this once known, the finding of the longitude of any place is comparatively easy. A knowledge of the true time being of the highest importance in keeping the reckoning of a ship on a voyage, the lords of the admiralty determined, about ten years since, on a means for making known daily the hour of one o'clock. Such is the skill displayed in the observations, that this hour is now ascertained with the utmost nicety, and from the summit of the building has been made known with the greatest regularity from the time the plan was first adopted.

Every day, at five minutes to one, the captains of vessels in the river, within sight of the observatory, may be seen directing their telescopes towards a black ball slowly rising on a pole fixed on the roof of its north-western angle; they then prepare their chronometers, and keeping their attention fixed on the ball, which has become stationary at the top of the pole, they note the instant when it begins to descend; at that instant it is one o'clock; and it will be obvious that the mariner has then the opportunity of knowing whether his chronometer is fast or slow; he may set it to the true time, and, by daily observation of the descent of the ball, ascertain its rate of going.

There is an apartment in the building appropriated to chronometers. It is the custom with makers of those instruments to send them to the observatory for correction and trial. Their daily rate is then observed, and noted down for the use of the owners; the same course is followed with the chronometers of ships lying in port. Visitors to Greenwich Park may frequently see a captain descending the hill with his time-keeper in a handkerchief under his arm. The present number of chronometers on trial exceeds one hundred, many of them being from government ships paid off, and thirty in preparation for the determination of the longitude of Valentia in Ireland.

Another very important object in the institution and maintenance of the observatory, is the observations of the moon, and the determination of the places of fixed stars necessary for ascertaining instrumental errors arising in those observations. In the early history of the building, these were regarded merely as secondary, but they appear to have been followed up with the greatest regularity, even when all others were neglected. The effect of this regularity is most honorable to the institution; for the existing theories and tables of the moon are everywhere founded on the observations at Greenwich, which is looked to as that from which alone adequate observations can be expected; and it is fair to predict that, while the duties are as efficiently performed as at present, lunar tables will always be founded on the same authority. To seafaring men lunar tables are of little less importance than true time; relying on their correctness, they sail away into the broad ocean, over which the calculations made thousands of miles distant serve as finger-posts. In order to render this branch of the observations still more efficient, an additional building is being erected, in which the moon may be observed through her entire passage. Owing to the construction of the portion of the building at present devoted to this purpose, one half of her course is very imperfectly observed, and one fourth is quite lost. When the new part is completed, it is anticipated that the observations on our satellite may be made almost every night; at present, from the cause above alluded to, they do not exceed one hundred in the year. Some idea of the patience necessary on the part of the observer, may be inferred from the fact of his being required to watch from moon-rise to an hour or more after sunrise, or from an hour before sunset to moonsetting.

Of late years, in addition to the astronomical, a series of magnetic and meteorological observations have been conducted at the observatory. For the observation of the magnetic dip, and some other points which could not be carried on near the great magnets, or other disturbing influences, a small outbuilding has been raised of wood, the

greatest care being taken that no particle of iron should be used in the construction. Such is the extreme delicacy and susceptibility of some of the instruments in this apartment, that they are suspended by skeins of fibrous silk, enclosed, in some instances, within tubes of glass. These skeins are prepared at Manchester expressly for the purpose; the fibres consist of seven or eight threads, as when reeled off in readiness for spinning; the slightest twist would render them unfit for use; and it is essential that they should be of uniform thickness.

There are three magnetometers, the magnets for which were made at Göttingen; they are of polished steel, each two feet in length, one inch and a half in width, and one quarter of an inch in thickness. In reading off the results, allowance is made for the presence of iron in the apparatus which supports them, or in other parts of the room. These instruments, with the barometer, and the wet and dry thermometers, are observed every two hours, day and night (except on Sundays;) the dew point four times every day; the magnetic dip is observed on the forenoon and afternoon of each of two days in every week; on one particular day in every month, previously determined for the observatories in various parts of the world, and known as a term day, magnetic observations are made at every five minutes; on one day in each month, hourly observations of the barometer are made; observations with the actinometer, an instrument for ascertaining the radiation of solar rays, are made when circumstances are favorable; electrical and extraordinary observations of any kind, when circumstances require them. The indications of the self-registering instruments are regularly preserved or read off; the rain gauges, &c., which are cumulative, but not self-registering, are read, some once in a day, some once in a week.

In addition to these instruments, there are an atmospheric electrometer, a galvanometer, and an anemometer. The last registers of itself the force, direction, and duration of winds. There are also self-registering thermometers, which are suspended from the side of the Dreadnought hospital ship, for ascertaining the temperature of the water of the Thames, with the object of assisting the registrar-general in the meteorological report affixed to his weekly sanitary report.

In astronomical science, everything depends on the precision with which the longitude of a place is determined as regards any other fixed place; by the transmission of chronometers from one point to the other, this may be ascertained. An operation of this nature is now in progress to determine the difference of longitude between Greenwich and Pulkowa, in Russia. As it is necessary that the observers as well as the instruments should be interchanged, M. Struve, astronomer at the latter place, has come over to make his observations from this point, for which purpose a transit instrument has been placed at his disposal.

The Nautical Almanac is generally printed three years in advance, for the benefit of those who go long voyages; the volume for the year 1847 is now published. The list of stars for this work has a first claim in the astronomical observations; and it is a rule that each star shall be observed at least twenty times in every three years. Besides these, there are observations of stars for refraction; of those selected for the moon-culminating list of the almanac: of those compared with

comets, and others observed in trigonometrical survey. The sun, moon, and planets are observed at every practicable opportunity, the latter through all hours of the night, (except on Sundays,) when the moon only, with accompanying stars, is observed. Occultations, diameters, and the eclipses and movements of Jupiter's satellites, complete a catalogue which, for scope and detail, reflects the highest credit on those concerned in its execution.

The electrical apparatus is attached to a pole 80 feet high, fixed in the garden; a wire connected with this is led into one of the rooms of the building, where pith balls, suspended near a bell, are attached to it. When the apparatus is excited by the electric state of the atmosphere, the balls become violently agitated, and striking against the bell, cause a ringing, which immediately attracts the attention of the attendant.

In Flamsteed's time, a well was sunk in this garden 100 feet in depth, with steps leading to the bottom, for the purpose of observing the stars in the daytime; but this has long since been arched over, as the improvements in the construction of telescopes render it unnecessary.

The whole mass of observations, both meteorological and astronomical, is regularly printed, a quarto volume of some thousand pages appearing once in the year. Most of these are distributed amongst the observatories all over the world, with a view to assist the cause of science, and to facilitate the great series of observations, undertaken at the expense of government, which have now been carried on for four or five years, and are expected to be brought to a conclusion in the present year. In order to have some security that the assistants, of whom there are nine regularly on the establishment, are in attendance to take their observations at the time appointed, a clock, commonly termed "the watchman's clock," is fixed in the ante-room; it has no hands, but a series of knobs, to which cords are attached on the dial-plate, which turns round; this is secured by a door with a lock and key, so that the only external communication is by the cords, one of which being pulled by the assistant when he leaves, a knob is displaced, the dial-plate turns round, and thus a complete check is kept upon the attendance of the subordinate officers.

Among the extraordinary scientific operations to which the observatory has contributed its aid, was that of instructing the officers of the corps of Royal Engineers, who were appointed to trace the Canadian boundary; one portion of which, a straight line of a distance of 70 miles, was to connect two defined points. The country through which this line was to pass is described as surpassing in its difficulties the conception of any European. It consists of impervious forests, steep ravines, and dismal swamps. A survey of the line was impossible; a plan was therefore arranged by the astronomer royal, founded on a determination of the absolute latitude and difference of longitude of the two extremities. The difference of longitude was determined by the transfer of chronometers, by a very circuitous route, from one end to the other; after which the necessary computations were made, and marks laid off for starting with the line from both extremities. One party, after cutting more than 42 miles through the woods, were agreeably surprised on the brow of a hill at seeing before them a gap in the woods on the next line of hill, which opened gradually, and proved to be the line of the opposite party. On

continuing the lines till they were abreast of each other, their distance was found to be 341 feet, a difference which arose in an error of only a quarter of a second of time in the difference of longitude. The performance of this operation reflects the highest honor on the officers engaged. Transits were observed, and observations made, on whose delicacy everything depended, when the thermometer was lower than 19 degrees below zero, and when the native assistants, though paid highly, deserted on account of the severity of the weather.

Such is a brief outline of an establishment which, whether we consider the nature and utility of its operations, or the comparatively small expense at which they are conducted, has great claims on our respect. We trust that our necessarily brief sketch will tend to diminish the stupid wonder with which the unpretending structure is regarded by thousands who climb the hill on which it stands. Let them think over its historical associations, and its importance not merely nationally, but in connexion with the whole world.

From Chambers' Journal.

SEVENTEEN FORTY-FIVE AND EIGHTEEN FORTY-FIVE.

THE arrival of the year forty-five in this century has produced a slight sensation—in Scotland particularly—over and above what the commencement of a new year generally occasions. We are all set a-thinking of that former forty-five in which such a remarkable series of domestic occurrences took place, deciding the fate of a dynasty with which an obsolete system of government and of faith was connected, and determining the current of public affairs and of social progress into a channel which it has never since left. We also recollect the extraordinary character of the transactions of the last forty-five, so highly calculated to take hold of the imagination and feelings; a piece of mediæval romance, as it were, which had by chance wandered into the age of whiggery and hoop-petticoats: sounding, amidst hosts of the commonplaces by which we are still surrounded, the expiring trumpet notes of chivalry. That great round in the markings of time, a century—impressive because it is just the first grand period which living man must all but despair of seeing accomplished in his own life—has now been completed since a disinherited prince, tartanned, targetted, pedestrian, but an Apollo of youthful grace and natural dignity, trailed his cloud of self-devoted Highlanders through Lowland Scotland and Central England, to regain the crown of a hundred ancestors, (the faith made it a reality,) or die in the attempt. How much was there concentrated in that strange pageant!—divine right breaking its head in madness against the impregnable walls of popular privileges—the Celt, in his dress and arms older than Romulus or Pericles, perishing in a last attack upon the overwhelming force of the higher-endowed Goth—generous feelings, eagerness to redress what were thought personal wrongs, unselfish worship of an ancient idea almost identified with religion, meeting a murderous rebuke from the cannon-mouth and the scaffold, and, in the inexorable sternness of human contentings, ridiculed as folly and condemned as crime! Since all this happened, a hundred years have passed, and laid everything but a memory

beneath the sod. "It will be all the same a hundred years hence," some rustic philosopher might have said at the time, as he heard the shouts of strife and the wailings of woe; and behold those hundred years have passed, and it is the same in the sense he meant it. We are only a few historical chapters the richer.

But the recurrence of a "forty-five" is not to awaken these romantic associations alone. We are also called upon as a nation to reflect with grateful feelings upon the progress which has been made by our country since the last of our civil wars, showing, as the retrospect powerfully does, the benefits which flow from intestine peace. The England, and still more particularly the Scotland, of 1745, how different from those of 1845! Hardly in any one particular is there not an improvement; while, taking the whole together, and considering it either by itself absolutely or relatively towards other states, an advance of a most remarkable nature is apparent. In that time Great Britain has acquired India, and planted far more colonies than are required to make up for the few New England states of 1745, which she has since lost. She has bound Ireland to her in incorporating union, making a United Kingdom, which probably contains not less than three times the population which existed on the same space in 1745. The national debt of 1745, has indeed increased from fifty, to be now not less than eight hundred millions; a somewhat alarming fact at first sight; and yet it cannot be doubted, considering the relative population and wealth, that the debt of a hundred years ago was a heavier burden than that of the present day. David Hume prophesied that when the national obligations came to a hundred millions, England must be ruined; but that sum has been multiplied by eight without insolvency, and no one would now expect that an advance to a thousand millions would be fatal to our national fortunes. The annual expenditure is now somewhat above the whole amount of the debt in 1745—a fact which may be partly to be deplored; but does it not indicate also a vast increase in the national resources! Since 1745, the productive powers of the soil, especially in the northern section of the island, have been more than doubled, in consequence of improved methods of agriculture and husbandry; but the improvement in this respect is small compared with that which has taken place in other branches of industry. The cotton manufacture has been created since 1745, and all the other great manufactures have been prodigiously increased. The shipping of the country has gone on in equal paces. See the best exponents of these facts in the rise of Manchester, Liverpool, Leeds, Birmingham, Glasgow, from the small towns which they were in 1745 to what they now are. Liverpool was not so important a town in 1745, as to have a newspaper. Manchester had only one. There were but twenty-eight in all provincial England, two in Scotland, and four in Ireland (in the two last cases, confined to the respective capitals.) London was then a town of under half a million of population—about one and a half of the present Manchester. Edinburgh had forty, and Glasgow twenty thousand; now the latter is computed to have 311,000. Lancashire has since then added just about one million to her population! The whole annual revenue of the country from customs in 1745, (about a million and a half) was not a *third* of what is now drawn on that account in

Liverpool port alone. The entire annual revenue of the empire during the reign of George II. (about eight millions on the average of thirty-three years,) is now considerably exceeded by the amount of customs received in the port of London. Since 1745, England and Scotland have been overspread with canals and railways, immensely facilitating the transit of merchandise. Enormous sums have also been spent on the construction of roads; and the principal public buildings of the three kingdoms have been reared in that time.

The advance has been much greater in North than in South Britain; and, indeed, we might affirm, with little chance of contradiction, that no country out of America has made a greater progress within the last century, or ever in one century made a greater progress, than Scotland has done in that time. In 1745, this ancient kingdom, at the distance of forty years, had not forgotten an unpopular union. There was a large party, including a considerable proportion of the gentry, decidedly disaffected to the reigning family. Some old sores, such as the Glenco massacre and Darien expedition, still rankled in the Scottish bosom. Thus the spirit of the nation was distracted. It was impossible, in such circumstances, that there could be any hearty application to courses of industry, or to enterprises promising general advantage. But when the claims of the Stuarts were finally quelled on Culloden moor, a new era seemed to commence, and from that time the pursuits of peace acquired a decided ascendant. Scottish historians usually conclude their narratives in 1707, saying that after that time their country has no history: a most surprising blunder indeed; the fact being, that our history before that period is merely curious and romantic—hardly in any degree instructive—while the subsequent period would possess for the political philosopher the highest value. A history of the country from that time to the present would be the history of human energies applied to their best purposes, and achieving the most admirable results. Most interesting is it, truly, to see this little nation, with their sterile mountains and moors, and only patches of good land between, setting themselves to overcome all difficulties, and, by dint of pure mental force—a perseverance which knows no tire, a sagacity hardly ever at a loss, ingenuity not to be baffled, prudence never to be lulled asleep—working out what we now see, a land made blithe with plough and harrow, firths whitened with merchant fleets, streams persuaded, since they are making falls at any rate, to fall for the benefit of huge mills planted upon their banks, and splendid cities rising where once there were only little towns. The agriculture of Scotland was, in 1745, but the agriculture of cottagers, embracing not one mode calculated to favor the powers of simple nature. Now its farming is an economical and scientific application of principles; not yet what it may be, but in the mean time a notable example to all other portions of the empire. Manufactures worthy of the name did not exist in 1745. Look now to the busy banks of the Clyde and Tay, not to speak of many other minor scenes of industry. In 1839, there were 676 "factories" in Scotland. Of the commerce of the country in 1745, we have an idea from the fact that Leith, the principal port, then had shipping under two thousand aggregate tonnage. The amount in 1840 was 19,954 tons. At Dundee, the writer of these pages played at whist two

years ago with a hale elderly gentleman, who said he had once farmed the shore dues of that port at £300: they had reached, in 1839, the large sum of sixteen thousand pounds! This town has risen from a population of 5302 in 1746, to 62,794 in 1841. A story is told that the mail bag from London arrived one day in Edinburgh, a short time after the year 1745, with one letter, being a missive addressed to the British Linen Company. It is hardly necessary to remark how huge the mail bags now are each day. The revenue of Scotland was at the Union £110,694; in 1788, it was £1,099,148: that collected last year was above five millions; being about what the revenue of the whole state was in the reign of George I. It may also be mentioned that the Scottish coin, when called in at the Union, was found to amount to little more than eight hundred thousand pounds. An old lady worth exactly double that sum of money died in Edinburgh about three years ago! There is perhaps nothing which more emphatically marks the national progress than the history of its banks. Of these establishments, there were two on the joint-stock principle in Edinburgh in 1745, and one private establishment in Glasgow; none at Aberdeen, Dundee, Perth, or any other town. The Bank of Scotland had, it seems, tried a branch at Aberdeen, but it failed to obtain sufficient business to make it worth while, and the money was quickly withdrawn, being brought, it is said, to Edinburgh on the backs of horses, the only mode of carriage which was then practised. At the present time, there are twenty-three joint-stock banks in Scotland, having three hundred and thirty branch establishments. The aggregate capital employed by the two Edinburgh banks in 1745 was £200,000: that now employed in joint-stock banks somewhat exceeds eleven millions. And here it may safely be remarked, that no banking concerns in the world have ever been managed with better success than those of Scotland—a fact mainly attributable to the caution which forms so conspicuous a feature of the national character. There has not been, within the memory of the living generation, a declaration of insolvency from more than four banks, and three of these were comparatively small provincial concerns; and the public, as distinguished from the shareholders, did not lose one farthing by them.

The progress of the capital forms a good criterion of that of the country, and no city assuredly could well show a greater change in a century than Edinburgh has done during that time. This city was, in 1745, one of 40,000 inhabitants—antique and inconvenient in structure, and pent up within walls capable of being defended against an enemy unprovided with artillery. The accommodations possessed by families of good figure were generally limited to three or four rooms, not more than one of which would be unprovided with a bed. Of the middle ranks, most lived in bed-rooms. Arrangements now deemed indispensable for cleanliness and delicacy were unknown. There was much homely comfort, but little elegance. It is entirely since 1767, that Edinburgh has burst from the limits of the Old Town, and spread herself in matchless beauty over the adjacent fields. Now we see the streets, which are devoted to the domestic accommodation of the middle and upper ranks, almost uniformly elegant, and houses occupied by shopkeepers which a judge or a landed gentleman could not have obtained eighty years

ago. And the whole habits of life of these parties are equally improved. It is common to hear old people praising the easy good-humored life of their young days; but it was in reality full of inconveniences, which either must have been constantly giving vexation, or were overlooked solely because of the low state of mind of those exposed to them. We learn from Sir Walter Scott's memoirs, that his parents lost all their children in infancy while they lived in the Old Town, and that he only escaped by being sent to the country. Another literary man born in Edinburgh, Mr. Kerr, editor of a well-known collection of voyages and travels, was the eighth or tenth child of his parents. All his predecessors had perished in consequence of the narrowness of the domestic accommodations, and his preservation was owing to the same cause as Scott's. Can we wonder at such results when we learn that Mr. Bruce of Kennet, a gentleman of estate, who, being in the law, became a judge of the supreme court, occupied with his family, about the beginning of the reign of George III., a house of one floor, rented at fifteen pounds, and containing three rooms, one of which was employed partly as his study, and partly as a bedroom for his children? When we know such things, we can hardly be surprised at Mr. Creech telling us, about 1790, that a French teacher left, for want of accommodation, the house which thirty years before sufficed for Lord Drummore. There cannot be a doubt that, built as Edinburgh now is, many a man of income exempt from property-tax is lodged better than men of rank and fortune were in 1745.

Since that period, the changes in the moral and intellectual character of the people, in their manners, customs, and language, have been equally great. Farmers then sat at the same table with their servants. It looks an amiable custom; but the sole cause was, that the farmers had no education or taste superior to their servants, and were in reality laboring people themselves. Gentlemen and ladies spoke broad Scotch; the former swore a good deal; the latter snuffed. Their meetings were rare, and without refinement. Female accomplishments, by which such a charm is now given to home, were then unknown. Few women could even write a letter; fewer still spell one correctly. The savagery still surviving in the national mind, even in cities, is shown strikingly in the execution of *Lynch law* upon Captain Porteous in 1736. The bigotry is shown in the Catholic riots of thirty years later. We have to go back but twenty-three years from 1745, to come to the last burning of a witch in Scotland. Then the state of public sentiment respecting the natural liberty and dignity of man, what an idea do we get of it from such facts as this—that, in 1755, while a press was going on for the Seven Years' War, a man who had been committed to the guard-house in Edinburgh "for swearing," was sent on board the tender, and, though earnest petitions were presented to the Court of Session to procure his liberation, the lords refused to interfere—or this, that, on the 30th of August, 1766, the Edinburgh Courant advertised a female negro slave for sale. At the latter fact we need hardly be surprised, when we recollect that, for thirty years after 1745, the whole class of colliers and salters in Scotland were bondmen. We hear more now of the miseries among the humbler classes than our fore-

fathers did in 1745; but this is not to prove that miseries were then unknown in that class. Groan as the poor might formerly, their voice was never heard; no inquiry was ever made into their condition. In the very fact of the groans being now heard, and their causes zealously sought for with a view to redress, it might be argued that we see something in favor of the present time. The spirit of the Scottish representatives of the former period was most abject. Their gross servility to the minister of the day was perhaps what mainly depreciated the national character in the eyes of the English, and produced the satires of Foote and Churchill. In reality, they were not a representation of the people of Scotland; but this our southern neighbors had no reason to suppose. Now, the Scottish members are fully as independent as any equal number taken at random out of the parliamentary lists; and, if we are not much misinformed, their election is conducted with an exemption from corrupting influences which is not paralleled in any other part of the United Kingdom. That the Scottish people, amidst all their changes, have not in any degree lost the peculiar religious spirit which distinguished them of old, recent events have fully shown. On a subject of some delicacy, it is not necessary to say more; but what is said is much.

Upon the whole, it appears to us that the British empire has made an advance in all the prime elements of greatness during the last hundred years, such as cannot be found paralleled on the same scale in any history. If we look into the past, we nowhere see such a bound forward made by any country; so that we may fairly say that here is a new exemplification of the power of a naturally well-endowed race to advance in national greatness when circumstances of a greatly unfavorable kind, such as a war, are not allowed a strong operation. It is very clear that no person living in 1745, and looking abroad upon his past and present, could have seen grounds for supposing that a century later was to commence such a period as we now see closing. Does not that period argue a degree of *national improbability* to which it might be difficult to set limits? Does it not show that, if no worse catastrophe than has marked the past century shall mark the future career of this empire, the condition at which it shall have arrived in 1945, in physical and moral greatness, must be something of which we would vainly at present endeavor to imagine the particulars? Why, this great and still increasing London may in 1945 be a town of eight millions of inhabitants—a phenomenon which the world has not heretofore witnessed. A vast amount of the waste and barbarous parts of the earth—perhaps all Asia, excepting that belonging to Russia—shall have then yielded to a British sway, and begun to adopt the manners, language, and moral ideas of this people. To how many of the distresses of the sons of earth will remedies have then been applied! How many great questions in physical science and ethics will then have been solved! How sweetly will the wheels of the social machine, as well as the current of individual life, then move! Alas, why have we been condemned to live in the early part of this darkling century, streaked but with the dawns of so much glory! How enviable those who shall be born unto our children's children!

From the *British Quarterly Review*.

THE PILGRIM FATHERS.

History of the Colonization of the United States.
By GEORGE BANCROFT. Vols. i., ii., iii. Boston and London.

It is instructive to observe how much is done in the government of the world by the ignorance of men more than by their knowledge. What we do from design is of small amount compared with what we do beyond our forethought. In all our plans we prophesy in part. The action of to-day generates the action of to-morrow. The scheme widens as it advances from purpose towards accomplishment. The one thing intended, brings along with it a host of things not intended; and as our vision takes a wider compass, consequences and contingencies are seen to multiply. One man creates the void, and another gives it occupancy. One agency unlocks the stream, and a multitude are in waiting to affect its course and issue. Evil comes from good, and good comes from evil. Thus mockery is cast over all human foresight. In this twilight of perception the greatest men have labored—Wycliffe and Luther, Columbus and Bacon. Much that was in their heart they have done, but much more which their heart never conceived have they accomplished. Being dead, they still speak and they still act—but the further the undulations of their influence extend, the less is the semblance between the things which are realized and the things which were expected. They have done less than they hoped, and more—much that they would have done, and much that they would not have done. In short, in the providence of our world, enough is plain and fixed to give pulsation to virtue and hope in the right-hearted; but enough is obscure and uncertain to rebuke impatience, and to suggest many a lesson of humility.

It was the pleasure of Elizabeth, and of her successors James and Charles, to take upon them the office of the persecutor. In that honorable vocation they found coadjutors, of suitable capacity and temper, in Whitgift, Bancroft and Laud. The sovereign and the priest gave themselves to such employment, in the eagacious expectation that the opinions of men were matters to be shaped according to the royal pleasure, with little more difficulty than the order of a court ceremonial. But the policy intended to secure an abject submission at home, became the unwilling parent of an enlightened independence abroad. Intolerance of freedom forced it upon new experiments, and proved eminently favorable to its development and power. The seed cast out found a better lodgment, and sent forth a richer fruit. The new world afforded space for its germination and growth which the old could not have supplied; and the new world has reacted upon the old, in the cause of freedom, as the old could not have acted upon itself. Even now, also, we are only in the beginning of that great outburst of enterprise and improvement which we trace to those memorable times, and, in great part, to the narrow and selfish policy of the agents above named.

The mind of the people of England, two centuries since, teemed with thoughts and excitements, of which the men of our time have no just conception. Our knowledge in this respect must depend on the force of our imagination, hardly less than on the extent of our reading. The great questions, both in politics and religion, which then

agitated society, were comparative novelties. The wonders of the new world, and of the whole southern hemisphere, were discoveries of yesterday. National questions, accordingly, were debated with a degree of passionateness and earnestness, such as we seldom feel; while distant regions loomed before the fancies of men in alliance with everything shadowy, strange and mysterious. The old world seemed to be waking at their side, as from the sleep of ages; and a new world rose to their view, presenting treasures which seemed to be inexhaustible. The wonder of to-day was succeeded by the greater wonder of to-morrow, and the revelations seemed to have no end. At the same time, to very many, their native land had become as a house of bondage, and the waters of the Atlantic were the stream which separated between them and their promised home.

That feeling is now among the bygone in our social history. But the traces of it are still at times discoverable. The broader and deeper stream, now rolling on, leaves its nooks and eddying points, where something of the past still retains a place, and still secures to it some influence over the present. It is now about twice seven years since we passed a few pleasant weeks in one of the less peopled districts of Dorsetshire—that county which Charles II. is said to have described as the only county in England fit to be the home of a gentleman. What the qualities were which, in the estimation of royalty, gave so much of the air proper to the home of gentle blood to the county of Dorset, it will not be difficult to conjecture. Dorsetshire is remarkable for the almost total absence of the usual signs of trade and manufactures. It is no less remarkable, as a natural consequence, for the absence of any considerable middle class to separate between the serfs who till the ground, and the lords who own it. Even agriculture is prosecuted within such limits as may consist with leaving an ample portion of its surface in the good feudal condition of extended sheep-walks and open downs. Such Dorsetshire has ever been, such it still is; but, thanks to projected railroads, such we trust it is not always to be.

On the occasion adverted to, we were indebted for a season to the hospitalities of an honest yeoman, whose residence had been occupied, in other days, by personages of much higher pretension than our host. It was an ancient mansion on a hill-side, overlooking an extended valley, which, from the corresponding forms of the hills fronting each other, resembled the bed of some departed Ganges, or St. Lawrence. The lower part of the valley was cultivated and wooded, but the high slopes of the hills were treeless and shrubless, except on the spot where the dwelling of our yeoman friend presented itself. That structure, with its somewhat castellated front, with its long ascent of half-decayed steps, its mutilated balustrades, and its ample terrace, rose amid lofty elms and chestnuts, forming a picture, not the less pleasant to look upon, from its contrast with the surrounding barrenness. Altogether this Dorset mansion was of a sort to work powerfully on that superstitious feeling and credulity, which are so deeply rooted in the mind of every rural and secluded population. The sounds which came after night-fall, in the autumnal and winter season, across that valley, from the distant sea, and which passed in such wild and strange notes through the branches of those ancient trees, and through the crazy apertures of that more ancient building, did

not fall upon the ear without some awakening effect upon the imagination. The dead, who once had paced those ferrasse walks, were not forgotten; and where could there be a more fitting haunt for those sights which "we, fools of nature," shrink from, than the spaces covered with the deep shadows of those overhanging trees—the living things, which budded and grew in the times of other generations, and which seemed to lift themselves aloft, as in a proud consciousness of being more associated with what has been than with what is. Within, also, there was much to strengthen fancies of this complexion. There were the gloomy stairs, with their dark walls, their long worn steps, and their railwork of massy oak. Apartments, with their antique panellings, their faded tapestry, and their concealed doorways. At night, the birds, who chose their lodgment amidst the ancient masonry of the chimneys, failed not to send their tokens of inquietude into the chambers below, as the gale from the neighboring channel came with tumultuous force upon the land. Part of the building, also, had become a ruin, thickly mantled with ivy, where owls might have pleaded their long holding as a right of tenantry, and from which they sallied forth at such times, as if glad to mingle their screams with the night storm, or to flap their wings against the casement of the sleeper.

To one apartment in that interior a special mystery attached. It bore the name of the book-room. Of that room the master of the house always retained the key. It was a part of his tenure that the contents of the book-room should on no account be disturbed. Among those contents, beside a curious library, were many other curious things—such as a bonnet, said to have been worn by Queen Elizabeth when visiting those western parts of her dominions; also a fan, which had been wielded by that royal hand; a whole suit of kingly apparel, reported to have been worn by Charles II., and to have been left at the mansion by its royal visitor. Above all, a skull was there. It was the skull of a murdered man. The mark of the death wound was visible upon it. Tradition said that the victim of human violence was an African—a faithful servant in the family which once found its stately home beneath that venerable roof. Amidst so much pointing to the dim past, we may be sure that the imagination of the dwellers in the old hall on the hill-side was not by any means unproductive.

Of course we must not confess to any participation in such susceptibilities in our own case. It was, however, a dark night, and a rough one too, when we obtained our first admission to the mysterious book-room. By the aid of our lamp, we explored the matters of virtue which it contained; examined the dreaded cranium, and found the mark of the wound upon it, strictly as reported. But our attention was soon directed from the curiosities to the literature. The contents of the library we found in no very orderly condition, and not a few of its treasures had evidently suffered much from the state of uselessness to which the whole had been for so long a time reduced. The books were partly on shelves and tables, and partly in heaps upon the floor. Among them were many existing in all the venerableness of the times before the invention of the printing-press. One of these sets proved to be an illuminated vellum transcript of the epistles of Innocent III.—a pontiff who, in common with many of his race, during the middle

age, conducted a correspondence, exceeding that of all the princes of Europe taken together. Many such works were there, and many learned volumes which had strayed from their fellows, and which bore upon them the marks of having suffered much in their wanderings. But the point which has brought the old Dorset hall on the hill-side, in this manner to our memory is, that, among the printed works in this long-neglected library, was a number of tracts, and pamphlets, and small publications, relating to the countries of the new world, and to the marvels of recent voyaging. Some of them bore date as far back as the times of Elizabeth, but most of them were of the time of James I., and a little later.

Some hours passed, and we were still beguiled by the perusal and comparison of these remains, which, like some newly-discovered fossil bed, pointed our imagination to a former condition of society, if not to a former world. We felt as though drifted back to those times. We thought we saw good Mr. White, the puritan minister of the neighboring town of Dorchester, as he went forth the spiritual leader of the little band, who, more than two centuries since, sought their spiritual as well as their natural home on the shores of New England. We seemed to listen to the talk of such men as the brave John Smith, and the Governor Winthrop; and to be witnesses to the conferences of such men as the Lords Say and Brooke, Harry Vane, and John Hampden, as they cogitated their schemes of settlement for injured and free-hearted men on the other side the Western Ocean. We remembered Queen Elizabeth, too—the grave men who were honored as her counsellors, her own stately presence, her own pliant but masculine temper, and the skill with which she dispensed the tokens both of her pleasure and of her pride. Her arts of cajolery to-day, her haughty invective to-morrow, her ambition—her innate love of rule at all times, and in all things. Her successor, also, we remembered—the king whose flesh gave signs of fear at the sight of a drawn sword. One of the most timid among men, having the place of chief over the bravest of nations. The monarch who presumed that he was born a great king, and who supposed that he had made himself a great clerk. The ruler whose soul was below all feeling of enterprise, presiding among a people with whom that feeling was strong, irrepressible, almost boundless. The frivolous imbecile, whose days were spent at the chase or at the cock-pit, and whose nights were given to court gambols, sensuality, and drunkenness; while around him were minds teeming with principles of the most solemn import, and with feelings of the purest and loftiest aspiration. The king who hated the name of freedom, and who strained his feeble and tremulous nerves to curb the genius of a people determined to be free. The least manly of all the sovereigns of Europe, claiming to be honored as a demi-god by a nation animated with the stern thought, and full-grown feeling of manhood, beyond any other nation in Christendom, and perhaps beyond all the nations of Christendom collectively in that age.

In all this we see a large amount of the unnatural, and the source of much inevitable mischief. But this mischief fell with its greatest weight on religion, and on the consciences of devout men. Many of the restless spirits of the time—the gallants as they were called—manifested their inquietude beneath this uncongenial control;

and no scene of action being open to them, either as soldiers abroad, or as inviting them to do some fine thing at home, they many of them turned their attention to the newly-discovered regions of the earth, and to plans of colonization. But your gallants are not good at colonization. That sort of enterprise demands something more rare than courage, and something more valuable than ordinary worldly sagacity. Social virtue is nowhere tested as in infant settlements. Men who go upon such experiments need rooted principle, no less than stoutness of heart, and a spirit of patient endurance.

In England, at the time to which we refer, it was on minds of this better order that the pressure in favor of emigration came with its greatest force. Elizabeth was the sovereign of a double empire. She claimed dominion over the soul as truly as over the body. By her ecclesiastical supremacy, she took under her jurisdiction, not only the things which belonged to Caesar, but the things which belonged to God. Her prescriptions on the matter of religion, embraced all that her people should believe, and all that they should do. From her pleasure they were to receive every article of their creed, and every direction, even the minutest, in regard to worship. No pontiff had ever exercised a more rigorous domination in this respect, when seated in the midst of his cardinals, than was exercised by Elizabeth, when presiding in her assembly of ecclesiastical commissioners. The men who should deny the right of the pope to assume such powers might be burned before St. Peter's. The men who made the same denial in respect to Elizabeth were hanged at Tyburn. The queen, indeed, was head of the church in a more intimate degree than of the state, her ecclesiastical functionaries being generally much more manageable in relation to the one, than her parliaments were found to be in relation to the other. Her power in this department was greater than in any other; and by her proud Tudor temper it was guarded with proportionate solicitude, and exercised with proportionate freedom. In her view, to deny her right to rule the conscience of her subjects, was to deny her right to rule at all, and therefore treason, and an offence to be punished as treason.

In stating thus much, we are not venturing upon ground open to debate. We merely refer to the unquestionable facts of history—facts deplored, we presume, by the modern churchman as sincerely as by the modern dissenter. The quarrel between Elizabeth and the puritans did not involve any direct impeachment of the ecclesiastical supremacy of the crown. The complaint of the puritan was, not that the queen had presumed to meddle with church affairs, but that she had not exercised her authority in such matters after the puritan fashion. It was deemed just that the sovereign, as such, should uphold sound theology, and scriptural discipline and worship; but the puritan claimed to be the judge as to the doctrine, regimen, or ritual, which should be so regarded. Hence conflict ensued between the royal-conscience and the subject-conscience. Opinions which the crown had ruled as being scriptural, the puritan denounced as erroneous; and regulations enjoined as seemly and devout by the one, were described as superstitious or profane by the other.

In the ecclesiastical history of England, the genius of presbyterianism has never proceeded beyond this point. In Scotland, of late years, it

has been otherwise. But in our own earlier history, the adherents of that system, while they claimed exemption in some things from the interference of the civil power, in other, and in greater things, they have clung to the aids of that power with a marked tenacity. The history of English presbyterianism, accordingly, has been too much a struggle for ascendancy, and too little a struggle for freedom. But ascendancy, not based on right, must not be expected to work rightly. It is the rule of the strongest, and it must be sustained by mere strength, more than by principle, virtue or goodness.

Even in the age of Elizabeth, however, there were men who had passed beyond the point adverted to—men who could draw the line, not with an infallible, but certainly with a vigorous hand between the secular and the spiritual—men who maintained that membership in a Christian church should be restricted to persons of Christian character; that the ministers of churches so constituted should be Christian men, approved as such by the persons to whom they minister; and that the worship and discipline of those voluntary assemblies should be determined wholly by themselves, and not at all by the secular power. In the reign of Mary, an act of state had set forth the whole people of England as constituting a popish church. On the accession of Elizabeth, an act of state had set forth the same nation as constituting a protestant church. In both cases the people were the same, and the priesthood for the most part remained the same. The bold men to whom we refer demurred to this manner of proceeding. The mixed multitude of people so spoken of, no doubt included many enlightened and sincere Christians, but could not, it was alleged, be described in any sober sense as being truly a church. In like manner, the ministry of such a church might include many devout men; but the validity of a ministry so appointed must rest on moral grounds, and not in any degree on the state sanctions which might be urged in its favor.

These principles, simple and harmless as they may now seem, struck at the root of the ecclesiastical supremacy then claimed by the crown. Elizabeth saw that if such doctrines became prevalent, the one half of her empire, and the half which she especially valued, must pass to other hands. Opinions of this nature, accordingly, were in her view treasonable—treasonable in the worst sense. They embraced that very principle of divided allegiance which had caused Romanism to become so obnoxious. The catholic gave his conscience in religious matters to his particular church. This new sect of protestants gave their conscience immediately to God. In either case, the body and the outward only were reserved in allegiance to the throne, the soul and the inward were given to another. In the judgment of Elizabeth, the man holding such a doctrine could be only half a subject, and its natural tendency was to reduce every crowned head to the condition of being only half a sovereign.

Robert Brown, a clergymen by education and office, and a kinsman to the great Lord Treasurer Burleigh, distinguished himself, about the middle of the reign of Elizabeth, as the promulgator of such opinions. This divine was a personage of ready, earnest, and impassioned utterance, and in his pulpit exhibitions was eminently popular. Crowds assembled to hear him at Cambridge, and

subsequently at Norwich, where he was benefited. As a preacher he was well known through great part of England, and with his itinerant and irregular services in that capacity, he connected the publication of his opinions from the press. One seal of an apostle was not wanting in his instance. In prosecuting his vocation, he found that bonds and imprisonment commonly awaited him. These he bore through many years with the most dogged obstinacy, if not with the most exemplary patience. It was his boast that he had been committed to more than thirty prisons, in some of which his hand could not be seen at noonday. To escape from this inconvenient usage, and from some more severe treatment with which he was threatened, Brown fled to Middleburgh in Zealand, and instituted a church in that city after his own model. But the pastor soon found occasion of disagreement with his new charge, and returning to England, he submitted to the authorities to which he had been so much opposed, and again became a benefited clergyman. Brown lived to an extreme old age, but the last forty years of his life were the years of a sorry worldling, and his death is said to have been brought on by one of those fits of passion and self-will to which he was liable.

The story of this unhappy man is instructive. He was one of a class—a zealot in religion, without being religious. His hatred of some real or supposed Christian abuses, was presumed to be evidence of his own Christian character; but while doing so much to mend the religion of other men, it was ere long to be manifest that he had no religion of his own. Passionate opposition to error is not the surest way to truth. Piety is self-government in its highest form. It is the Christian temper which must regenerate Christian institutions.

It was natural that the men who embraced the principles once avowed by this apostate should be solicitous not to be called by his name. But their enemies were no less solicitous to fasten that reproach upon them. To call them Brownists, was to identify them with the extravagant, the fickle, and the base in the career of Robert Brown. What theologian, or what philosopher even, could be expected to forego so felicitous an occasion of using a nickname. The principles of the said Brown were one thing, and the character of the man another. But how much was to be gained by not seeming to perceive that distinction? The learned and the vulgar—philosophy and Billingsgate—are found, on such occasions, to possess much more in common than is commonly supposed.

But whatever may have been the case with their persecutors, the conscientious men holding the principles which Brown had abandoned, were philosophers enough not to allow themselves to be scared from great truths by the accident of an infelicitous association. They held their secret assemblies. They possessed a private printing-press, and issued tracts and treatises, sometimes grave and sometimes satirical, impugning the order of things in the established church, and inculcating their own widely different views on such subjects. In some of these pieces the language employed was not always the softest which might have been chosen. But men perishing under the weight of hard blows, may be excused if they sometimes use hard words. Proclamations

were issued to suppress these irregular proceedings, and many of the alleged delinquents were made to feel that these intimations of the royal pleasure were not so much empty threatening.

Two Brownist ministers, named John Copping and Elias Thacker, were imprisoned in Bury St. Edmund's, on the charge of dispersing books opposed to the ecclesiastical supremacy of the crown, and acknowledging the authority of the queen in civil matters only. Within our own memory, confinement in a jail, especially in some provincial districts, has been connected with enough of the loathsome and the horrible. But of the miseries of such a duration in the age of Elizabeth, we have little conception, except as suggested by some of those painful descriptions which have reached us from the cells of such sufferers. Copping and Thacker might have obtained their liberty on renouncing their errors, and promising conformity. During five long winters their wants and wretchedness were made to plead on the side of submission, but though examined once and again, they wavered not. At length they were apprised that their life would be the cost of their further contumacy. On the 4th of June, 1583, Thacker was led to the place of execution. The books which he had been convicted of dispersing were burned in his presence, and the injured man gave noble proof that his religious principles were stronger than his fear of death. Two days afterwards, Copping was conducted to the same spot, and having witnessed the same proceedings, died with the same martyr firmness. It is something to meet death as the soldier meets it, when multitudes share in the common peril; it is more to submit to it in the comparative solitariness of martyrdom, when nothing can come from man except the influence of distant sympathy or admiration; but these sufferers bade adieu to earth amidst circumstances which left them no sustaining power, beside their simple hope of heaven. The scattered and bleeding remnant who would honor their memory, were a people despised as much as they were wronged. The heart is formed to crave a sympathetic power from other hearts, and can be strong without it only as strength shall come to it from a much higher source. Man becomes superior to the terrors of this world, in such circumstances, only as he can take firm hold on a better.

The houses of persons suspected of embracing the opinions professed by these men were often rigorously searched. The officers employed on those occasions frequently ill-treated even the women and the children of such families, and, under various pretences, often added the spoiling of their goods to insult and oppression. In 1592, fifty-six men of this sect were apprehended while holding a secret assembly for religious worship in a large room in the parish of Islington. The place of meeting was that in which the persecuted protestants had often worshipped during the reign of Queen Mary. These persons were committed to the dungeon in Newgate, the Fleet, Bridewell, and other prisons in the metropolis. One of their number states that their persecutors "would allow them neither meat, drink, fire nor lodging, nor suffer any, whose hearts the Lord would stir up for their relief, to have any access to them; purposing, belike, to imprison them to death, as they have done seventeen or eighteen others, in the same noisome jails, within these six years." Most of these men were needy persons, with fami-

lies dependent for subsistence on their industry. Their offence was declared to be unbailable, and according to the bad usage of those times, a jail delivery, in place of coming at brief and certain intervals, as with us, was an event which the government managed to evade in particular cases, so as to punish, by means of imprisonment, to any extent, denying to the imprisoned their right to an open, a legal, and a speedy trial. Many, accordingly, died in prison, and the prayer of the men who had been apprehended at Irlington was—“We crave for all of us but the liberty either to die openly or to live openly, in the land of our nativity; if we deserve death, it becometh the majesty of justice not to see us closely murdered, yea, starved to death with hunger and cold, and stifled in loathsome dungeons; if we be guiltless, we crave but the benefit of our innocence, that we may have peace to serve our God and our prince, in the place of the sepulchres of our fathers.”

Among the persons apprehended in 1592, were Henry Barrow and John Greenwood. In the records of the proceedings against these recusants, the former is described as “gentleman,” the latter as “clerk.” Barrow was the author of a petition to parliament on behalf of himself and his suffering brethren, from which the above extracts are taken. The indictment against Barrow and Greenwood charged them with holding and promulgating opinions which impugned the queen’s supremacy; with forming churches, and conducting religious worship contrary to law; and with having indulged in libellous expressions concerning some eminent persons. On these grounds sentence of death was passed on them; and in pursuance of that sentence, they were both conveyed from Newgate to Tyburn.

The rope was fastened to the beam and placed about their necks, and in that state they were allowed for a few moments to address the people collected around them. Those moments they employed in expressing their loyalty to the queen, their submission to the civil government of their country, and their sorrow if they had spoken with irreverence or with improper freedom of any man. They reiterated their faith in the doctrines on account of which they were about to suffer death, but entreated the people to embrace those opinions only as they should appear to be the certain teaching of Holy Scripture. When they had prayed for the queen, their country, and all their enemies and persecutors, and were about to close their eyes on the world, the proceedings were suddenly stayed, and it was announced that her majesty had sent a reprieve. The revulsion of feeling which ensued may be imagined. Consciousness of life suddenly flowed back to hearts from which it seemed to have passed away, and men as good as dead again began to live. The breathless people shared in this reflux of emotion. The condemned men gave expression to their joy as became them—the people did so in loud acclamations; and, as the victims were re-conducted from the suburbs of the metropolis to Newgate, the populace in the lanes and streets, and from the windows of the houses, hailed their return as a happy and righteous deliverance. On that day, Barrow sent a statement of these occurrences to a distinguished relative, having access to Elizabeth, pleading that, as his loyalty could no longer be doubtful, he might be set at liberty, or at least be removed from the “loathsome jayle” of Newgate. But early on the following morning the two prisoners were again

summoned from their cells. All that had taken place on the preceding day proved to be mockery. It was not true that the bitterness of death had passed. They had again to gather up the strength of nature which might enable them to meet that stroke from the hands of a public executioner, and thus, mentally at least, it was their hard lot to undergo the penalty of a double dissolution. They were now conveyed to the same spot with more secrecy, and were there disposed of in the manner in which society has been wont to dispose of marauders and cut-throats.

The case of John Penry was similar to that of Barrow and Greenwood, but, in some respects, is a still more affecting illustration of the tyranny of the times. Penry was a native of Wales. He had studied at Cambridge, and had taken his degree at Oxford. He was a young man of considerable scholarship, of sincere and fervent piety, and in the warmth of his religious zeal he ventured to publish a treatise, in which he complained, with some vehemence, of the pride, and secularity, and popishness of the state of things in respect to religion, with which the English nation appeared to be so well content. A warrant was issued for his apprehension, which he eluded, by seeking an asylum in Scotland. But returning to London soon after the execution of Barrow and Greenwood, he was speedily apprehended; and he appears to have foreseen from that moment all that would follow. Lord Chief Justice Popham passed sentence of death upon him, on the ground of certain papers found in his possession, which were construed as seditious. It was pleaded by the accused that no public use had ever been made of those papers, that some of them were not his own, and had not even been more than very slightly examined by him. But defence was vain. He was admonished that his case admitted of no plea that could avail him. From his prison Penry addressed protestation to the lord-treasurer, containing the following characteristic passages:—

“I am a poor young man, bred and born in the mountains of Wales. I am the first, since the last springing of the gospel in this latter age, that publicly labored to have the blessed seed thereof sown in those barren mountains. I have often rejoiced before my God, as he knoweth, that I had the favor to be born and live under her majesty for the promoting of this work. And being now to end my days before I am come to the one-half of my years in the likely course of nature, I leave the success of my labors unto such of my countrymen as the Lord is to raise after me. An enemy unto any good order or policy, either in church or commonwealth, was I never. All good learning and knowledge of the arts and tongues I labored to attain unto, and to promote unto the uttermost of my power. Whatsoever I wrote in religion, the same I did simply for no other end than the bringing of God’s truth to light. I never did anything in this cause (Lord, thou art witness!) for contention, vain-glory, or to draw disciples after me, or to be accounted singular. Whatsoever I wrote or held beside the warrant of the written word, I have always warned all men to leave. And wherein I saw that I had erred myself, I have, as all this land doth now know, confessed my ignorance. Far be it that either the saving of an earthly life, the regard which in nature I ought to have to the desolate outward state of a poor friendless widow, and four poor fatherless infants which

I am to leave behind me, or any other outward thing, should enforce me, by the denial of God's truth, contrary to my conscience, to sell my own soul. The Lord, I trust, will never give me over to this sin. Great things in this life I never sought for, not so much as in thought. A mean and base outward state, according to my mean condition, I was content with. Sufficiency I have had, with great outward troubles, but most contented I was with my lot, and content I am, and shall be, with my undeserved and untimely death, beseeching the Lord that it be not laid to the charge of any creature in this land. For I do, from my heart, forgive all those who seek my life, as I desire to be forgiven in the day of strict account, praying for them as for my own soul, that although upon earth we cannot accord, we may yet meet in heaven, unto our eternal comfort and unity. Subscribed with the heart and the hand which never devised or wrote anything to the discredit or defamation of my sovereign Queen Elizabeth, I take it on my death as I hope to have a life after this. By me, John Penry."

Penry wrote in terms equally noble-hearted and devout to the brethren of the fugitive church adhering to his principles, and still existing in London. On the eighth day after his trial, a warrant was issued for his execution; and on that same day, preparations were made for giving it effect. He was taken in a cart from the Queen's Bench prison, Southwark, to St. Thomas Waterings, the place where the gallows then stood. All had been done with indecent haste. No crowd had assembled to stimulate him to manhood by their presence, or to greet him with their sympathies. No friend stood near to drop one word of counsel or encouragement. He had his place alone. To God only—the last refuge of those deserted by man—could he look. The life in his veins flowed in its full vigor, for he was still in the thirty-fourth year of his age. But the power to which he was subject had no pity; the rope was placed about his neck; the signal was given, and for a cause which scarcely merited punishment at all, he hung there until dead—the scholar, and the man of piety, consigned to the same doom with the murderer.

But the good people of England, and especially of the metropolis, had their musings and speeches about these proceedings. The men so dealt with were known to be sound protestants—men of piety, loyalty, and learning; and concerning the government, the prelates, and, above all, concerning Whitgift, the Archbishop of Canterbury, and the great patron of these measures, much was said, which conveyed a meaning that could not have been welcome in those quarters. From this time the punishment of such alleged offences by hanging was deemed inexpedient. It was accounted more safe to pursue the same course by means of imprisonment or banishment. The instincts of humanity have often risen up in this form, as a monitory and controlling power, which even the strongest despotism has not reckoned it prudent wholly to disregard. The most successful tyrants have been thus made to learn that there is a point beyond which outraged humanity must not be expected to be silent or submissive.

But imprisonment in those times, from its duration and its miseries, was hardly less terrible, to those who really knew what it meant, than capital punishment; and the long-harassed people to whom we refer began to think very generally of

voluntary exile as their wisest expedient. Even this course, however, was beset with difficulty. They could escape only by secret means; to be detected was to fall into the snare they were so much concerned to avoid. But the thought of the religious freedom which might be enjoyed in Holland was so welcome, that for that object numbers became willing to bear the pains of separation from their native land, and to brave the dangers of attempting to withdraw from it. Many made that attempt with success, but some were less fortunate. An instance of the latter kind is recorded in the history of Robinson, a clergyman, who had embraced the principles of the Brownists, but who so far modified those principles on some points as to bring them more into the form of modern congregationalism, and who, on that account, is generally regarded as the father of the English Independents. Robinson, and a large company, contracted with the master of a ship for a passage to Holland. They were to embark at Boston, in Lincolnshire, on a certain day, and from a point agreed upon. The captain was not punctual. At length, however, the vessel arrived and, under cover of the night, the men, and women, and children, all reached the ship in safety. But the captain was a villain. He betrayed them to the officers of the port. The passengers and their goods were immediately removed from the vessel to several boats in waiting to receive them. All their property was turned over and examined, and not a little of it rifled. The persons of the men were searched "even to their shirts," and the women were treated with indelicacy and rudeness. When these unhappy people reached the town, crowds assembled to gaze upon them, and many mocked and derided them. Nor was their condition improved when brought before the magistrates. Several were bound over to the assizes, and all were committed to prison. Some were released after the confinement of a few weeks, others after a longer period.

This happened in 1602. In the following spring, Robinson and his friends resolved on making a second attempt of this nature. They made an arrangement for this purpose with a Dutch captain; and their plan now was, that the men should assemble on a large common, between Grimsby and Hull, a place chosen on account of its remoteness from any town; while the women, the children, and the property of these parties, were to be conveyed to that point of the coast in a barque. The men made their way to the place of rendezvous, in small companies, by land. But the barque reached its destination a day before the ship. The swell of the sea was considerable, and as the females were suffering greatly from that cause, the sailors ran the barque into the shelter of a small creek. The next morning the ship arrived, but through some negligence on the part of the seamen, the vessel containing the women, their little ones, and the property, had run aground. The men stood in groups on the shore, and that no time might be lost, the captain of the ship sent his boat to convey some of them on board. But by this time, so considerable a gathering of people in such a place, and in a manner so unusual, had attracted attention; information had been conveyed to persons of authority in the neighborhood; and as the boat which had taken the greater part of the men to the ship was proceeding again towards the shore, the captain saw a large company, armed with swords and muskets, and com-

sisting of horse and foot, advancing towards the point where the barque was still ashore, and where the few remaining men had grouped together. Fearing the consequences of his illicit compact, the captain returned to the ship, hoisted sail, and was speedily at sea. Robinson—honest and able general as he was in every sense—had resolved to be the last to embark. He was a witness, accordingly, of the scene of distress and agony which ensued. The outburst of grief was not to be restrained. Some of the women wept aloud, others felt too deeply, or were too much bewildered, to indulge in utterance of any kind; while the children, partly from seeing what had happened, and partly from a vague impression that something dreadful had come, mingled their sobs and cries in the general lamentation. As the sail of that ship faded away upon the distant waters, the wives felt as if one stroke had reduced them all to widowhood, and every child that had reached the years of consciousness, felt as one who in a moment had become fatherless. But thus dark are the chapters in human affairs in which the good have often to become students, and from which they have commonly had to learn their special lessons. The ship soon encountered foul weather, and after being driven far along the coast of Norway, all hope of saving her being at one time abandoned, she at length safely reached Holland. In the mean while, persecution at home was found to have become a more tedious and odious affair than formerly, and it so happened, in consequence, that by the year 1608, Robinson and the remainder of his company succeeded in leaving their native country, and in obtaining a quiet settlement in Leyden.

In that city the church under the care of Robinson increased until it numbered more than three hundred members, consisting almost wholly of English exiles. Robinson himself was greatly respected: by the clergy of Leyden, and by the professors in the university, and on more than one occasion the pastor of the Congregational church in that city gave public proof that his piety, his amiableness, and his eminently practical understanding, were allied with sound scholarship, and with much intellectual vigor and acuteness. He succeeded, also, in communicating much of his own well-regulated temper to his charge. We have good reason to believe that no church in Europe in that age exhibited more of the wise simplicity of a primitive church, or more of that correctness of habit by which we suppose the primitive churches to have been distinguished.

But there are affinities between certain seeds and certain soils, and where these are wanting, the husbandman may labor never so wisely, and still reap only a small return. It is with the mental in this respect as with the physical. This fact is illustrated in the history of Independency in Holland. In the hands of Robinson that system was exhibited with every advantage, but the Hollanders were not to be attracted by it. On the contrary, the intermarriages between the exiles and the Dutch, the necessity laid upon many of the young to quit the homes of their parents, and some other causes, tended to diminish the number of the Independents, so that, after the lapse of ten years, it began to be apprehended that if some new course were not taken, the principles of the settlers, so far, at least, as Holland was concerned, were likely to become extinct; and, which was more painful still, there was as little prospect as ever of

those principles finding any friendly shelter in England. It was this state of things which suggested the expediency of attempting a settlement in the New World. Persecution in England, and apathy in Holland, seemed to point to that course. Nor were the feelings of loyalty without their influence in this matter. Even in the land of the stranger, this much-injured people never failed to evince some pride in speaking of King James as their "natural prince;" and they manifestly shrunk from the thought of seeing their children cease to be subjects of the British crown. England was still their mother-land; its institutions were the bequests of their own noble-hearted fathers; and, after all their ill treatment, to no spot on earth did the generous nature of these exiles turn with so much force of affection. Their fear, they say, was, "that their posterity would in a few generations become Dutch, and so lose their interest in the English nation;" while their own desire rather was, "to enlarge his majesty's dominions, and to live under their natural prince." Moreover, "a great hope and inward zeal they had of laying some good foundation, or, at least, to make some way thereunto for the propagating and advancement of the gospel of the kingdom of Christ in those remote parts of the world—yea, although they should be but as stepping-stones unto others for the performance of so great a work." These reasons in favor of such an enterprise were first debated in private. The more they were weighed, the more did obedience to them appear to be a duty. At length they were propounded in public. Solemn days of humiliation were then appointed, that the Divine will might be known. Some of those days were given to private meditation and prayer. On others, the heavenly guidance was sought by conjoint supplications in the house of God. In the end it was agreed—"that part of the church should go before their brethren into America, to prepare for the rest. And if in case the major part of the church should choose to go over with the first, then the pastor should go along with them; but if the major part stayed, that he should then stay with them."

Our own age is not likely to appreciate the spirit which prompted to this movement in the age of which we are writing. Our philosophy, in connexions of this sort, vain as we sometimes are of it, is, for the most part, a very superficial affair. Our greatest pretenders to sagacity in this shape, judge too much of other times by their own, and of other men by themselves. The theology of the Congregationalists in Leyden was that of all the reformed churches, but their principles in relation to church polity and religious worship were peculiar to themselves. These principles, moreover, were not adopted as so many points of the expedient or the seemly, but were regarded as taught in the Scriptures, and as taught there no less certainly than the doctrines of their theology. In their judgment, the hand from which they had received the one had given them the other. The polity had come with the theology, because the former was in its nature the best adapted to secure the ends of the latter. Ages of darkness had obscured both, but the time had come in which the influence of the spirit of the Reformation should be extended equally to both. Care about the one was as truly a religious duty as care about the other. Churches constituted as those maxims required, were churches which must cease to be

of the world, and must stand forth as the manifest work of God. In them, the power of the worldly, which had done so much to obscure the religion of the gospel, could have no place. In their instance, the religious must be fully emancipated from the control of the secular; and the church, possessed of her proper freedom, be prepared to enter on the discharge of her proper mission. Every such church is an enfranchised body, vested with the full power of self-government. It is the government of the religious in the church, adumbrating the just government of the virtuous and the state. It exhibits man religiously as man should be socially. It exacts a moral fitness, preparatory to the conferring of this franchise, and it confers the franchise wherever that fitness is realized. It is a polity devised by Infinite Wisdom to conserve religious truth and religious order; and it contains many suggestive lessons, which, if wisely applied, might suffice to regenerate the condition of the world. Among the means of human improvement, accordingly, these principles are entitled to the highest place. Men have done well in having done so much to rescue from threatened oblivion the remains of ancient literature and art. But in these religious principles, so long buried amidst the ruins of the middle age, there were treasures of much greater worth. The precious things of the scholar or the virtuous were so many fragments recovered from the past genius of man, but these elements of spiritual government were so much wisdom recovered from the lost revelation of God—the former might contribute to embellish the present, the latter possessed a power to embellish and ennoble the present and the future.

Robinson and his coadjutors may not have been accustomed to express themselves in these precise terms, but the thoughts which these terms convey were all familiar to them; and it was with views thus devout and expanded, that they contemplated their removal to the distant regions of the west. Seed so precious was not to be lost, and how best to conserve it until its wider diffusion should place its extinction beyond all danger, was their great solicitude. It is manifest, from their subsequent history, that in some respects they still needed further light concerning the province of the magistrate in regard to religion, but to the extent above stated they had fairly proceeded. It may be said, indeed, that all this was so much delusion; the notions so valued are not taught in the New Testament, nor can they be shown to be pregnant with any such marvellous tendencies as are thus ascribed to them. Our answer is, that we are not concerned just now with the question of the truth or falsehood of these opinions, nor with their real or supposed tendencies. We look to these principles simply as having been entertained; and as having been thus viewed; and in this matter of fact alone, we find enough to impart to the conduct of the pilgrim fathers the strictest consistency, and, withal, a dignity—a high moral heroism, which has not been surpassed, and which can hardly be said to have been equalled, in the history of ancient or modern nations.

Until 1614, the whole extent of country from Florida to Canada bore the name of North and South Virginia. From that year the northern division began to be known by the name of New England. James had chartered two companies of merchants, the one in London and the other in Plymouth, empowering them to make and regu-

late settlements along that extended coast, and to the distance of a hundred miles inland.

The Plymouth company had made little use of their patent, until occasion was afforded them of doing so by the project of the congregation at Leyden. So many of those persons as had resolved to become colonists sold their property and threw the proceeds into a common stock, and their first expenditure from that fund was in the purchase of a small vessel of sixty tons, which bore the name of the Speedwell. In that vessel several of the brethren, who were deputed to make some requisite negotiations in England, performed their voyage and returned. But the Mayflower, a ship of one hundred and eighty tons, was hired in London, to sail in company with the Speedwell. The former vessel was secured for the voyage only, the latter, the colonists meant to retain for the service of the settlement. When the Speedwell reached Delft Haven, the brethren of the deputation proceeded inland to Leyden, and reported faithfully to the congregation the result of their embassy. They had obtained a document which secured to them liberty of worship, and had made the best terms they could, in other respects, with the company of merchant adventurers at Plymouth.

And now came the season for separation. He was a bold man who was the first to commit himself to a passage across that world of waters which has been since found to separate between the shores of Europe and Africa, and those of the great western continent. We have sometimes thought, that of all the tests which have been applied to the courage and firmness of the human spirit, that must have been the greatest. Nor was it soon that the dangers and hardships of such a voyage began to be thought inconsiderable. Pirates, and the ships of hostile nations, generally infested those seas. The vessels of those times, also, were few of them of a structure adapted to brave the perils of such a voyage; and the interior economy of ships, if we may so speak, down to a comparatively recent period, left those who made long voyages subject to inconvenience, want, and disease, in a degree happily little known to us. It was from these causes that so long an interval passed after the discovery of North America, and so little was done towards establishing any important relation between that continent and Great Britain. We can excuse the pious men and women of the congregation at Leyden, if when they looked forward to such a voyage, and to the possible beyond it, they had their moments in which the prospect awakened in them something like dismay. But with them, prayer had always been the antagonist of fear. To look to their God in the time of trouble was to become strong. On this memorable occasion, accordingly, they gave themselves to religious exercises of special solemnity. A day of humiliation was appointed. On that day their pastor addressed them from the language of the prophet Ezra—"I proclaimed a fast there at the river of Ahava, that we might afflict our souls before God, to seek of him a right way for us and for our little ones, and for all our substance." Many suitable counsels were given to them, of the nature of which some judgment may be formed from the following passage:—

"Brethren," said Robinson, "we are now quickly to part from one another, and whether I may ever live to see your face on earth any more, the God of heaven only knows; but whether the Lord has appointed that or no, I charge you, before

God and his blessed angels, that you follow me no further than you have seen me follow the Lord Jesus Christ.

"If God reveal anything to you by any other instrument of his, be as ready to receive it as ever you were to receive any truth by my ministry; for I am verily persuaded the Lord has more truth yet to break forth out of his holy word. For my part, I cannot sufficiently bewail the condition of the reformed churches, who are come to a period in religion, and will go at present no further than the instruments of their reformation. The Lutherans cannot be drawn to go beyond what Luther saw: whatever part of his will our good God has revealed to Calvin, they will rather die than embrace it. And the Calvinists, you see, stick fast where they were left by that great man of God, who yet saw not all things.

"This is a misery much to be lamented, for though they were burning and shining lights in their times, yet they penetrated not into the whole council of God; but were they now living, would be as willing to embrace further light as that which they first received, for it is not possible the Christian world should come so lately out of such thick anti-christian darkness, and that perfection of knowledge should break forth at once.

"I must also advise you to abandon, avoid, and shake off the name *Brownist*. It is a mere nickname, and a brand for the making religion and the professors of it odious to the Christian world."

There is enough in the enlightened candor and vigorous perception evinced in this passage, to justify the highest praise bestowed on this eminently gifted man. In the religious service adverted to, instruction was followed by prayer, prayer became that of deep feeling, and deep feeling found its vent in abundance of tears. The majority of the congregation determined to remain for the present in Leyden, and Robinson, as before provided in that case, was to remain with them. The number of the colonists was about one hundred and twenty. Most of their brethren, especially the more aged, accompanied them from Leyden to the neighboring port of Delft Haven; and thus, says their own historian, "they left that good and pleasant city, which had been their resting-place about eleven years." They found the ship in readiness for departure. Some of their friends, who could not accompany them on their leaving Leyden, now contrived to join them; others came from Amsterdam, all being desirous of seeing them once more, and of deferring their farewell to the last moment in which it might be uttered. One night still remained to them. It was a night, we are told, of little sleep; and was employed "in friendly entertainment and Christian discourse, and other real expressions of true Christian love. The next day they went on board, when truly doleful was the sight of that sad and mournful parting; to hear what sighs, and sobs, and prayers did sound among them; what tears did gush from every eye, and pithy speeches pierced each others heart; that sundry of the Dutch strangers that stood spectators could not refrain from tears!"

But the tide now seemed to rebuke these delays. Separation, however painful, could be deferred no longer. Robinson fell upon his knees, the whole company around threw themselves into the same posture, and while every cheek of man, of woman, and of their little ones, was bedewed with tears, the man of God sent up his parting prayer from their midst for the much needed blessing of Hea-

ven upon them! Mutual embraces followed, and that leave-taking came, which, to the greater number, was a last leave. The wind was fair. The ship now glided from her place; all her canvass was spread, and soon the eye, straining to retain the sight of the faint and cloud-like sail, saw nothing save the blue line of the distant sea!

The Speedwell soon reached Southampton, where the Mayflower, with some brethren on board who had not returned to Holland, was awaiting her arrival. The colonists being all now assembled, expressed their mutual congratulations, and directed their thoughts more intently towards their new home. Several weeks, however, were still occupied in making the necessary provisions for so responsible an undertaking. At length, on the 5th of August, in the year 1620, the Speedwell and Mayflower sailed from Southampton. But they had not proceeded far, before Reynolds, the master of the Speedwell, complained of that vessel as being in an unsound state, and insisted that it would be perilous to venture across the Atlantic in her, without considerable repairs. Both ships, accordingly, put in at Dartmouth, from which place, after the Speedwell had been caulked, they again set sail. But when they had run about a hundred leagues, Reynolds again complained of the ship, and both vessels returned to Plymouth. The Speedwell was there abandoned, and the whole company committed themselves to their voyage in the Mayflower. It proved afterwards that Reynolds was treacherous, either fearing that the provisions would not be adequate, or that the expedition from other causes would be a failure. The Speedwell performed several voyages subsequently without danger. These delays were the more to be regretted, as the summer was now past, and the prospect was that of a winter voyage. On the 6th of September, the Mayflower sailed from Plymouth, and made her way, with a fair wind, to the southwest, until the faint headlands of Old England became to the pilgrims like so much faded cloud, and at length wholly disappeared. They had most of them sighed farewell to the coast of their mother country before, when they had fled from her shores in search of a resting-place in Holland. But this farewell must have been uttered with a deeper feeling, as being more like their last!

The voyage was long, rough, and painful, and at more than one time perilous. In the ninth week the pilgrims came within sight of land, which, on a nearer approach, proved to be that of Cape Cod. The Hudson River, their place of destination, lay farther southward. But the weary voyager, on regaining the sight of the green earth, is eager to plant his foot upon it. The pilgrims yielded to this impulse, and as they reached the shore, "fell upon their knees, and blessed the God of heaven who had brought them over the vast and furious ocean, and delivered them from many perils and miseries." It is not too much, to say, that in that first prayer from the soil of the New World, ascending from so feeble a brotherhood amidst a wilderness so desolate, there were the seeds of a new civilization for mankind, the elements of all freedom for all nations, and the power which in its turn shall regenerate all the empires of the earth. Half a day was thus spent. The pilgrims then urged the captain to pursue his course southward. But the Dutch had resolved to establish settlements of their own in those parts, and had bribed the commander to frustrate the

purpose of the colonists in that respect. This he did by entangling the ship amidst shoals and breakers, instead of putting out to sea, and foul weather coming on in the early part of the second day, they were driven back to the Cape. It was now the middle of November. The shelter offered at the Cape was inviting. The captain became impatient to dispose of his company and return. He admonished them that nothing should induce him to expose himself and his men to the hazard of wanting provisions. Unless they meant, therefore, that he should at once set them and their goods on shore and leave them to their course, it would behove them to adopt their own measures and to act upon them without delay. They knew that the documents they had brought with them from England gave them no authority to attempt a settlement on the land now before them. But the plea of necessity was upon them, and was more than enough to justify them in selecting a home wherever it might be found. The voyage had reduced most of them to a weak and sickly condition. The wild country, as they gazed upon it from their ship, was seen to be covered with thickets and dense woods, and already wore the aspect of winter. No medical aid awaited them on that shore, no friendly greetings, but hardship and danger in every form. They felt that their safety, and such poor comfort as might be left to them, must depend in their power to confide in God and in each other. Hence, before they left the *Mayflower*, they constituted themselves as subjects of "their dread sovereign lord King James," into a body politic, and bound themselves to such obedience in all things as the majority should impose. The men all signed the instrument drawn up for this purpose, but they did not exceed forty-one in number, themselves and their families numbering one hundred and one.

Mr. John Carver was chosen as their governor for one year, and the first act of the new chief was to place himself at the head of sixteen armed men for the purpose of exploring the country. When they had extended their inspections to somewhat more than a mile from the coast, they discovered five Indians, whom they followed several miles further, in the hope of bringing them to some friendly communication, but without success. Directing their steps again towards the shore, they came to a cleared space, where some families of Indians had been not long since resident. But no spot proper to become their home presented itself. One of their number saw a young tree bent down to the earth, apparently by artificial means, and being curious to know what this thing meant, the white man ventured near, when on a sudden the tree sprung up, and in a moment our good pilgrim was seen suspended by the heel in the air. He had been caught in an Indian deer-trap, and we can suppose that even so grave a company would be somewhat amused at such an incident, especially when they had fully extricated their incautious brother without further mischief.

The Bay of Cape Cod is formed by a tongue of land, which juts out from the continent for thirty miles directly eastward into the sea; it then curves to the north, and stretches as a still narrower strip in that direction to about the same extent. The bay itself, accordingly, is somewhere about thirty miles across either way, being bounded by the main land on the west, by a curved tongue of land on the south and east, and being open to the sea, in its full width, on the north. The second

exploring expedition from the *Mayflower* was made with a boat, under the direction of the master, and consisted of thirty men. They sailed several leagues along the coast without discovering any inlet which could serve the purpose of a harbor. In running up a small creek, sufficient to receive boats, but too shallow for shipping, they saw two huts, formed with stakes and covered with mats, which, on their approach, were hastily deserted by the natives who inhabited them. Some of the company would have attempted a settlement at that point, the ground being already cleared, and the place being such as promised to be healthy, while it admitted of being put into a posture of defence. The setting in of winter, of which the colonists were made more sensible every day, manifestly prompted this counsel. But others advised that an excursion should be made twenty leagues northward, where it was certain they might secure good harbors and fishing stations. The boat however, returned, and a third expedition, which should go round the shores of the whole bay, was resolved upon.

The chief of the colonists were of this company; Carver, Bradford, Winslow and Standish—all afterwards men of renown—were of the number, with eight or ten seamen. It was the sixth of December, when they descended from the deck of the *Mayflower* to the boat. So extreme was the cold, that the spray of the sea as it fell on them became ice, and was shaken in heavy fragments from their apparel, which at times was so overlaid as to give them the appearance of men clad in mail. The landscape, as they coasted along, presented little to attract them. Its forests were black and leafless, and its open spaces were covered with snow more than half a foot deep. As they looked round on that scene, they had to remember that they were five hundred miles from the nearest English settlement, and that Port Royal, the nearest French colony, was at a still greater distance. In prospect of such a region, they might well have prayed that their landing might not be in winter—but such was their lot. That day they reached the spot now known by the name of Billingsgate Point, at the bottom of the bay. Landing in the evening, they passed the night on shore without disturbance. In the morning, they divided their company, and directing their course westward, some coasted along in the boat, and others explored the land, crossing its snow-covered hills, and threading its dells and forests with no little difficulty. But this second day was as barren of discovery as the preceding. In the evening, they ran the boat into a creek, and constructing a barricade of trees and logs, they all slept on shore.

They rose at five in the morning, and continued in their prayers till daybreak, when suddenly loud and strange cries were heard, and a shower of arrows was poured in upon them. The Indians had attacked them. They seized their arms, but had not more than four muskets with them, the remainder being left in the boat. The assailants did not disperse on the first fire. One of them, with great courage and dexterity, took his position behind a tree, withstood three volleys, and discharged three arrows in return. But the object of the enemy was to scare rather than to conquer; and when they had retired, the pilgrims again bowed themselves in prayer and thanksgiving before God. They now committed themselves to their third day of search.

Nearly fifty miles of coast they inspected, but the long-sought good—a convenient harbor—was still undiscovered. The pilot, however, had visited those regions before, and assured them, that if they would trust themselves to his guidance, they would reach a good haven before night. But the elements did not seem to favor this prediction. The heavens become dark. Heavy rain and snow begin to fall; the wind becomes boisterous; the sea swells; and in the tossings which follow, the rudder is broken, and the boat must now be steered by oars. The men look with anxiety to the sky, the sea, and the land; but all is gloomy, pitiless, and menacing. The storm increases; it is perilous to bear much sail, but all that can be borne must be spread, or it will be in vain to dream of reaching the expected shelter before night. A sudden wave throws the boat upon the wind; in a moment, her mast is rifted into three pieces—mast, sail and tackling are cut away with the utmost speed, and are seen floating on the distant waves. The tide, however, is favorable, but the pilot, in dismay, would now run the boat on shore in a cove full of breakers. The moment is as the hinge of life to all on board. A stout-hearted seaman exclaims—“If you are men, about with her, or we are gone!” The words are electric; the prow of the boat is again turned to the elements; they make their way through the surf; and within an hour, they enter a fair sound, and shelter themselves under the lee of a small rise of land. It is now dark; the rain beats furiously; that dimly-seen shore is the home, probably, of savage men; to descend upon it and to kindle a fire must be perilous—may be fatal. But the men are so wet, so cold, so exhausted! They resolve to land. With difficulty the newly-gathered wood is made to send forth its welcome glow; and then they make such provision as they may for the night.

As the day began to dawn, they found the place on which they had landed to be a small island within the entrance of a harbor. This day was Saturday, and many of their company were so weak and sickly, that the greater part of it was given to rest, and to such preparations as were necessary for exploring the country. But the next day, being the Sabbath, could not be so employed. The pilgrims felt the advancing season, knew the haste of the captain and crew to return, and remembered the suspense of their families and brethren, from whom they had now been absent three days; but nothing could induce them to overlook the claims of the Christian's day of rest. On the morning of Monday, the 11th of December, old style, these fathers landed at a point, to which they gave the name of New Plymouth, in grateful memory of the hospitality shown them in the last English port from which they sailed. On that spot they resolved to fix their settlement. The anniversary of their landing still calls forth the gratitude and reverence of their posterity, and the rock on which they first planted their foot, may be seen, within an appropriate inclosure, in front of a building of the modern town, which bears the name of the Pilgrims' Hall.

In a few days, the *Mayflower* entered the harbor of New Plymouth. But the shore was such, that in landing their goods, it was necessary the men should wade considerably in water, which added greatly to the subsequent sickness among them. On the 19th, all quitted the ship, and were immediately employed in building a storehouse, in

raising small dwelling-houses, and in disposing of the adjacent ground. In respect to religion, everything had been determined before their embarkation, and in respect to civil affairs, they had already adopted their polity. Popular government, in its fullest extent, was the element both of the civil and of the ecclesiastical constitution, which they had before approved, and which they now confirmed. Their state polity, indeed, was the pure and natural result of circumstances; but their religious polity, as that of an independent or congregational church, they ascribed to a higher source—the authority of Holy Scripture. Had New England been colonized at an earlier period in our history, or had its first successful settlement originated in almost any other manner than that we have described, everything in its social condition would have derived a strong impression from the older institutions of the mother country. But now, all was free, and the great advantage of *beginning well* was secured.

But, intent as the settlers were on raising their places of abode, their labor in that respect proceeded slowly. The season of the year left them only short days, and often on those days only brief intervals, between the storms of sleet and snow, that could be so employed. Nearly all were suffering from fevers, and coughs, and general sickness, brought on by long exposure to unwonted hardships. As the cold increased, disease strengthened, and deaths became frequent. The comparatively healthy were little able to bestow the required attention on the sick, and every funeral was as if the dying had been called to the burying of the dead. At one season, there were not more than seven persons capable of performing such offices. Amongst those who were the earliest cut off, was a son of Carver, the governor. His own sickness and death soon followed; and then his affectionate wife sunk broken-hearted to the grave. Carver was a man of a noble and generous nature. He had sold considerable estates, and had assigned the whole value to the benefit of his companions. In all their trouble, no man descended more readily to the humblest service in behalf of the meanest. The mourning colonists buried him with such military honors as they could command, discharging several volleys of musketry over his grave. William Bradford, the subsequent historian of the colony, was chosen his successor. But in the course of this melancholy winter, of the hundred and one settlers, fifty were removed by death!

In March, the cold abated, the wind came from the south, and “the birds sung pleasantly in the woods.” The *Mayflower* now left the harbor, and returned to England. But after so many had fallen victims to exposure and climate, the remainder were in danger of perishing from want. In the autumn new emigrants arrived. They came without provision. The pilgrim families could not see them die of hunger, and during six months they all subsisted on half allowance only. “I have seen men stagger,” says Winslow, “by reason of faintness for want of food.” At one juncture, it appeared to be their doom that famine should destroy them. They were saved by the compassion of fishermen, whom foul weather had driven to their coast. Nor did these things soon end. Even in the third year of their settlement, their provisions were so far spent, that, in their own language, “they knew not at night where to find a bit in the morning.” It is said, that in the spring of 1623, they were reduced to the last pint

founding a new empire in the New World—an empire not only additional to all that had gone before, but different in its spirit, its institutions, and its religion, from all that had hitherto obtained a place in history.

While many of the exiled independents removed from Holland to New England, many remained in the former country, in hope that the posture of affairs at home might become such as to allow of their return. It was pleasant to think that their ashes might still be laid in the land of their fathers, and that something might still be done by them towards the enlightenment, the freedom, and the happiness of their native country. These hopes were not indulged in vain. In 1649, just about two centuries since, the change came which had been so devoutly wished, and from that time Independency has never ceased to be one of the forms of Christianity professed in this country. But what has been its history!—what is its present condition! During the times of the civil war and the commonwealth, the sagacity and energy allied with that system were not altogether unworthy of it—but what has it done since! We admit that almost everything around it has been uncongenial. Its greatest foes, however, have been from within. It has too often fainted in the face of rebuke—it has not always folded its vesture about it, and fronted the storm as it should have done—it has been wanting, too, we think, in some graver matters. Indeed, in all the points in which the Pilgrim Fathers were strong, modern independency has shown itself weak.

Nothing is more marked in the character of the devout men who found their home at New Plymouth, than the clearness with which they apprehended their distinctive principles, and the importance which they attached to them. It was that they might save those principles from again falling into oblivion that they had become exiles, and that, having become exiles, they still committed themselves to the perils, and hardships, and griefs, of becoming colonists—colonists in one of the most distant and inhospitable regions of the known world. Men who hold principle with a grasp of this order, always hold it to some purpose. The truth thus embraced, is truth that may not die.

Then there were the children of these people. The good most valued by the parents, it was natural they should be most concerned to bequeath to their offspring. Every father in the memorable forty-one who embarked in the *Mayflower* was as the father of Hannibal—the war against error being committed as a legacy to his children. It was the fact, that some of these were seen falling from their steadfastness by reason of their connexion with strangers, and the hope that such danger would be effectually precluded by such removal, that prompted the heads of the pilgrim families to their memorable expedition westward.

But these plain, thoughtful men looked not to their immediate children only; they looked to a distant posterity, to the future church of God—the future generations of mankind. There was magnanimity in them, largeness of thought and largeness of feeling. In their instance, professions of this nature were not so much mere sentimentality—not a selfish vanity taking the guise of better affection. Their conduct towards the settlers of New Weymouth is evidence that they were men

superior to littleness of soul—men of exalted and generous sentiments. They lived not to themselves. It was their study that their path might be that of benefactors to the living and to the unborn.

But strong as was the attachment of these confessors to that order in church government and worship which they were so careful to observe, all principle of that nature was viewed as subordinate to piety, and was valued in proportion to its supposed conduciveness to piety. What feeling inferior to that of a most conscientious homage to the Invisible, could have led these people to expose themselves to so much suffering, or could have sustained them under the pressure of that suffering! In all their ways they sought a higher guidance than that of mortals. The day of fasting and prayer went before every step of moment in their history. Their first act on touching the soil of the New World, was to prostrate themselves in the exercise of their spiritual priesthood before God; and when exploring the winter shores of that region, you see them employed hours before day in presenting thanksgiving and supplication to their Maker. They believed in God; they were assured of his presence; they confided in him with the fear and the affection of children. The elements were of him—men were of him—and could do no more than his bidding. They loved their polity because it aided their piety. In their case it was not a barren framework, thrust into the place of piety. It was valued because it gave them a real Christian fellowship, and because in so doing it strengthened their Christianity.

Hence it happened, that the strength of their adhesion to their principles as congregationalists, was not more remarkable, than the catholicity of their spirit towards devout men of all other communions. "Their residence in Holland," it is said, "had made them acquainted with various forms of Christianity; a wide experience had emancipated them from bigotry, and they were never betrayed into the excesses of religious persecution." Such is the testimony of Bancroft, whose work on this interesting department of modern history is the most authentic and able in our language. But this result, so little to have been expected in those times, may be traced to the personal character of Robinson, fully as much as to residence in Holland. In respect to certain great principles, that excellent man concluded that he had arrived at certainty; but in many things, as we have seen from his own language, he supposed that both himself and others were still in need of further light. Independency in his hands was fixed in regard to its great principles, but was left to a candid latitude in respect to lesser things. Hence, Mr. Edward Winslow, some time governor of New Plymouth, speaks of the rule of this first proper congregational church in respect to communion in the following terms:—"It is true we profess and desire to practise a separation from the world and the works of it, and are willing to discern an appearance of the grace of God in all we admit to church fellowship. But we do not renounce all other churches; nay, if any joining to us formerly at Leyden, or here in New England, have, with the confession of their faith, held forth the duty of an entire separation from the church of England, I have divers times heard either Mr. Robinson our pastor, or Mr. Brewster our elder, stop them forthwith, showing that we required no such thing at their hands, but only to hold forth

faith in Christ Jesus, holiness in the fear of God, and submission to every ordinance and appointment of God."

Such, then, were the elements of character most observable in the Pilgrim Fathers. Do modern independents possess them? In many they may no doubt be seen—seen in a degree marking a true spiritual lineage. But too commonly we see the obscure in knowledge in place of clearness, and the cold in feeling in place of ardor; or else the substitution of a zeal for polity in the place of a zeal for piety, allied too often with an intolerance of temper, incompatible with a just estimate of the better qualities which belong to the devout of every communion, and leading, not only to one-sidedness and misconception, but to an indulgence in misrepresentation, invective, and personalities little consistent with loud professions of attachment to the principles of general freedom. We know that early independency had its faults of this nature in other connexions; but Robinson of Leyden and the men whose character he moulded were nobly free from them. We venture to say, that if modern independents would be the powerful body in this country, which two centuries should have made them, it must be by a more general return to that model of temper and action which is before them in the history of the Pilgrim Fathers. Their wisdom will be found in looking thus to the standard they should follow, much more than to those wrongs and provocations—a plentiful crop, no doubt—which naturally dispose them to indulge in the spirit of retaliation. Temptation comes to all, but while some men fall into the snare, others know how to turn it to advantage.

SCROFULA.*

THE startling facts brought forward as to the *creation*, we may call it, of scrofulous affections by impure air, are new, and present some of the gloomiest features of the volume, inasmuch as they prove the fatal effects of the pernicious influences complained of, in the existence of a deteriorating population, diseased in themselves, and bequeathing disease to a still more wretched posterity. Joseph Toynbee, Esq., one of the witnesses examined, appears to have devoted special attention to this part of the subject: on being asked as to his observation of "the effect of defective ventilation," he replies—"The defective ventilation appears to me to be the principal cause of the scrofulous affections, which abound to an enormous extent amongst our patients. When I have had a scrofulous patient come before me, I have always been able to trace this as one of the agents." He cites the work of a French physician, M. Baude-logue, in which it is stated "that the repeated respiration of the same atmosphere is the cause of scrofula; that if there be entirely pure air, there may be bad food, bad clothing, and want of personal cleanliness, but that scrofulous disease cannot exist." The following facts are further quoted:—"The development of scrofula is constantly preceded by the sojourn, more or less prolonged, in air which is not sufficiently freshened. It is impossible to deny that hereditary disposition, the lymphatic temperament, uncleanness, want of clothing, bad food, cold and humid air, are of themselves circumstances non-effective for the production of scrofula.

* From an article in Chambers' Journal, upon the first volume of the Report of the Health of Towns Commission.

"When it is seen, on the other hand, that this disease never attacks persons who pass their lives in the open air, and manifests itself always when they abide in an air which is unrenewed, and this whatever may be the extent of other causes, it appears evident that the non-renewal of the air is a necessary condition in the production of scrofula. Invariably, it will be found on examination, that a truly scrofulous disease is caused by a vitiated air, and it is not always necessary that there should have been a prolonged stay in such an atmosphere. Often a few hours each day is sufficient; and it is thus that persons may live in the most healthy country, pass the greater part of the day in the open air, and yet become scrofulous, because of sleeping in a confined place, where the air has not been renewed. This is the case with many shepherds. It is usual to attribute scrofula, in their case, to exposure to storms, and atmospheric changes, and to humidity. But attention has not been paid to the circumstance, that they pass the night in a confined hut, which they transport from place to place, and which protects them from wet; this hut has only a small door, which is closed when they enter, and remains closed also during the day; six or eight hours passed daily in a vitiated air, and which no draught ever renews, is the true cause of their disease. I have spoken of the bad habit of sleeping with the head under the clothes, and the insalubrity of the *classes* where a number of children are assembled together."

An instance is adduced in corroboration: "At three leagues from Amiens lies the village of Oresmeaux; it is situated in a vast plain, open on every side, and elevated more than 100 feet above the neighboring valleys. About sixty years ago, most of the houses were built of clay, and had no windows; they were lighted by one or two panes of glass fixed in the wall; none of the floors, sometimes many feet below the level of the street, were paved. The ceilings were low; the greater part of the inhabitants were engaged in weaving. A few holes in the wall, and which were closed at will by means of a plank, scarcely permitted the air and light to penetrate into the workshop. Humidity was thought necessary to keep the threads fresh. Nearly all the inhabitants were seized with scrofula, and many families, continually ravaged by that malady, became extinct; their last members, as they write me, died *rotten with scrofula*.

"A fire destroyed nearly a third of the village; the houses were rebuilt in a more salubrious manner, and by degrees scrofula became less common, and disappeared from that part." Other facts are brought forward, all tending to prove the fatal effects of vitiated air, and the beneficial results of a constantly pure atmosphere, not only on the health, but on the morals of the people. Other authorities—Dr. Blacke, Dr. Blakely Brown, Dr. Duncan, and Professor Aksen—fully confirm these statements; in addition to which, we are informed that "defective ventilation may be considered one great cause of all the diseases of the joints which we so frequently meet with, as well as of the diseases of the eye and skin—shingles, lepra, and *porrigo*, or ringworm. Besides the eye, the ear is injuriously affected by vitiated air, which thus becomes the cause of many cases of deafness. It is a fact, that at least two times more of the children of the laboring-classes are affected by earache and deafness, than of children of the rich and better-conditioned classes, less exposed to the like influences."

founding a new empire in the New World—an empire not only additional to all that had gone before, but different in its spirit, its institutions, and its religion, from all that had hitherto obtained a place in history.

While many of the exiled independents removed from Holland to New England, many remained in the former country, in hope that the posture of affairs at home might become such as to allow of their return. From the Edinburgh Tales.

LITTLE FANNY BETHEL.

THERE is not a more weather-proof man in all London than myself, though I say it; nor one who, in all seasons, has more contempt for the cockney comforts of omnibuses, cabs, and all chance lifts whatsoever; from the dignity of "a friend's carriage," to a "set down" in the family apothecary's snug one-horse chaise. Yet, in one or two days of every year—those few days which have a sensible effect in thinning the rolling human tide which sets in from Temple-Bar, through Fleet-street and the Strand—I am sometimes—in spite of the protective powers of my famous umbrella—induced, knowingly, to give Nurse Wilks' remonstrances the credit of a temporary confinement; and to remain for a whole morning in my apartment, with no better society than a good sea-coal fire, nor more amusing companion than my old "Diaries." My readers know that these are kept in useless ledgers, crossed and re-crossed in choice hieroglyphics of my own invention. I trust none of my admiring friends—to vindicate the credit of their own sagacity in having distinguished me—will, after my death, present these tomes to the British Museum. They would assuredly puzzle future antiquaries more than the celebrated Rosetta stone. The key to that has, I believe, been found; but I defy any future Champollion to discover that the violet and the oak sapling, which illuminate my page 486, signify Little Fanny Bethel and somebody else.

In running over this aforesaid ledger, I am sometimes tempted to believe that I shall have a long account one day against my thriving brother James, the rich solicitor, for trouble taken and anxiety endured in his matters. He gets off by alleging that I never undertake any *job* for him unless I first take a fancy to it myself. He would insinuate that, in business affairs, I am little more than an amateur performer, and that I will play nothing save my own favorite pieces, and those in my own time; and that, in the particular case of the little Allahbad Bethels, upon which I raised a special claim, I was certainly a volunteer. It may have been so. The protracted silence of the relatives of two very young orphan creatures gave scope and leisure for anxiety upon their account to any one who chose to take interest in them. I had undertaken to communicate to their uncle, Mr. Bethel, then at Baden, the death of his brother in India. This event had been followed, in a few days, by that of Captain Bethel's widow; and the children, through the kindness of friends in the regiment of their father, had been sent to England by a private subscription. They were now on the high seas, *consigned* to the care of their late father's agent in London, Mr. James Taylor. The gist of my epistle was:—"Rich and powerful elder brother, what is to be done with your younger brother's orphan children? You are head of the house; its fortunes have devolved to you in consequence of your rights of birth; but you have the feelings of a Christian and a brother, and the principles of an honorable man. You know your duty."—It was a well-worded epistle enough; but having been three times read and admired, and having received the praises of my sister Anne, I had the discretion to burn it, notwithstanding; and to adopt, with slight alteration, that concocted officially by my brother's clerk, George Roberts, which con-

tained only the needful. I was aware of being upon ticklish ground with Mr. Bethel.

While he was pondering our information at Baden, the *Indiaman*, by which the little orphans were coming home, was encountering heavy gales in the channel; and, though not absolutely wrecked, the vessel was so much damaged, that it was found necessary to lighten her, as she lay off Margate. As many of the passengers as could get off in the pilot boats had landed; and the captain and subordinate officers, too much occupied by their onerous and responsible duties, had sent their little passengers to a hotel in Margate, together with their *Ayah*, or Hindoo nurse-maid; and, by a hasty note, informed my brother that they must immediately be taken away! *Ay*, taken away! But whither? Baden was mute; and the Rectory of Stockham-Magna gave no sign. In it resided another family of Bethels—"more than kin and less than kind."

"No independent provision for the poor little things at all!" sighed my ever good-hearted, indulgent sister-in-law. "But military men can now save so little in India, with reduced allowances and increased expenses."

"I shall never forgive Tom Bethel, though, for not ensuring his life," said my brother. "I urged him to it before he embarked, five years ago. Were it but a thousand pounds, it might have educated the boy at some cheap Yorkshire school; and surely the friends will take the little girl!"

"The *friends!*" I repeated; for this name for the aggregate Bethels of the hall and the rectory sounded at this time oddly to me, in relation to the children at Margate. But they must be taken away; and I was upon the road in the next hour.

The Bethels of —shire were one of those stanch, far-descended families of wealthy English commoners, who, from pride of birth and Jacobite politics, had disdained to veil a name so long distinguished in county annals under a modern title. They had even shunned the alliance of new-made nobility. But they had been much less successful in warding off the inroads of modern habits of expense. Notwithstanding their large estates, their church livings, and their West India property, the Bethels had been a struggling family for two generations; and, in the third, this began to be severely felt. It had been a family custom—existing from the reign of Henry VIII., which had brought the Bethels a liberal share of the general "spoliation" of that period—to reserve the best of the *family*-livings for the younger sons of the *family*—the second son being, in general, preferred. But, in the last generation, my gay acquaintance, Tom Bethel, between admiration of a dragoon uniform and saddle, and some compunctious doubts about his own vocation to the church, had committed the indiscretion—as his college friends called it—of allowing the third brother, John, to take orders, and step into the living of Stockham-Magna, which, of itself, was worth above a £1200 a-year.

"Indiscretion," and "great indiscretion," were the phrases of Tom's mother and sisters, with whom his fine temper and handsome person made him a favorite. This act was afterwards called in the family, "Tom's generosity;" for John, though much more cautious, had imprudently married a young woman of birth equal to his own, with exactly nothing between them, save the hopes

derived from Tom's vocation to glory. In due time, the Reverend John, who, his mother soon discovered, had a decided call, settled soberly down in the rectory; gave up fox-hunting, to which, as a —shireman, he had been born; exchanged the trifle of chicken-hazard, into which he had been seduced by his elder brother's fashionable guests, for a quiet, earnest rubber of whist, with a few pleasant neighbors; and, had the family interest been as good as in the reign of the Charleses, bade as fair to die a bishop as any preceding Bethel of the stock.

The Dowager Mrs. Bethel informed those of her Cheltenham correspondents who were of a serious character, that her son, John, was a most exemplary and pious clergyman; and they reciprocated, that he was, indeed, an ornament to the Church of England, and one who, by his piety and learning, would adorn the mitre. His sermon at Brighton had made the proper impression in the proper quarter.

When Captain Bethel, about two years after his love-match, visited his relations previous to embarking for India, his young wife, who, though she still thought Tom "divinely handsome" in his dragoon uniform, had also felt the slightest possible pinch of poverty, exclaimed, as they drove from the rectory, "What pity, dear Tom, that you conceived such an aversion to the church!—Stockham-Magna would have been a paradise to us—and so near all our friends!"

"I chose rather to die a general—and to plunder the enemy, instead of fleecing my flock, Frances," returned Lieutenant Bethel. And, with hopes of being a general, he did die a captain. Mrs. Bethel gave a long, lingering, farewell look to that charming place, where she could willingly have left her little girl, the infant Fanny; but, as she told us in passing through London, neither her mother-in-law, the dowager, nor Mrs. John Bethel, had once spoken of her infant, dead as India was to children.

People will die in England as well as in India, even though living in a comfortable rectory, drawing great tithes and small, and in momentary expectation of golden prebends. The family vault was again opened to receive the Rev. Dr. Bethel, shortly after he had followed his mother to that resting-place, and some months before the death of his brother in India. His wife, though she had rashly entered the family, had gained the esteem of its leading members, Mr. Bethel and his lady; and, when she was left a widow with three young children, things were arranged pleasantly for her, by the appointment of the same young cousin to the living, who had preached Dr. Bethel's funeral sermon. She continued to reside at the rectory, as before; and the intimacy between the family at Bethel's Court and that at the parsonage, became more cordial and intimate than it had ever been during the life of the excellent and venerated person, as he was called in the funeral sermon, who had formed the bond of union. It was whispered in the tea and card circles of Wincham—the neighboring market town, a place of great ecclesiastical antiquity, and, until the era of schedule B, of great political consideration—that Mrs. Dr. Bethel had a still deeper concern in the great and small tithes of Stockham-Magna, than arose from her continued residence in the rectory. But this amounted nearly to that ill-defined crime called simony; and the rumor had clearly originated with one or other of the five Misses Roach, sis-

ters of the whilom principal surgeon of Wincham, who, when attending the lady at the hall in a sudden illness, had, as the reward of his skill and assiduity, obtained a half promise of the living for his son and their nephew:—it was, therefore, liable to question, if not to doubt. No one in Wincham would or could believe that Mr. Bethel, with his high-church principles and high gentlemanly feelings, could wink at an arrangement which spared his own purse, by fixing his brother's family upon the new incumbent. It was not to be credited. But, at the same time, it was agreed, on all hands, that Mr. Whitstone, the new rector, was the most generous of cousins, and that Mrs. Dr. Bethel and her children still lived in the same comfort and elegance which they had enjoyed during the life of her husband.

Sales by piecemeal, and mortgages by wholesale, had nearly eaten up the family estates of the Bethels; but Mr. Bethel still derived a very large income from the estates which his lady, also a Bethel, of a younger branch, had brought into the family; though the tenure by which they were held constituted the greatest cross which he and his wife were destined to bear. At her death, without children, they went to yet another branch of this far-spread stock; and Mrs. Bethel had given no heir to the united properties. The want of children, in a great and ancient family, like that of the Bethels, is always a subject of infinite interest to the kindred, and of concernment to the whole neighborhood. In ordinary circumstances, Mrs. Dr. Bethel, of the Rectory, might have submitted to the will of Heaven, under a misfortune which brought her own son next in succession; after "Tom's boy in India," indeed—but a child there was hardly worth reckoning upon. As the family stood, however, she would far rather that a cousin-german of her daughters' should be at the head of this fine property, than that it should pass away to a lad in the north, whom no one knew anything about. Her sincere sympathy in the family affliction of Bethel's court, had advanced her in favor there; but it was her aversion to the unknown heir presumptive, sometimes laughingly insinuated, and at other times seriously betrayed, as if by accident, when prudence and good-breeding were conquered by strong feeling, that confirmed her influence at the hall.

Mr. and Mrs. Bethel, still a fashionable, but not now a gay couple, had lived a good deal on the continent for several years; during which period, their clever sister-in-law was their confidant and manager in all domestic affairs. It was, therefore, to her that Mr. Bethel wrote, upon receipt of my brother's letter, regarding the disposal of the orphan children. We were afterwards told that he was much affected by the death of his only remaining brother, whom he had always loved better than the Rev. John; and that, in the first impulse of tenderness, he proposed to take the children home; but his lady prudently referred to her sister-in-law.

In the mean time, I reached Margate without any remarkable adventures. These are, indeed, become as rare in England as the wild boar or the wolf.

What a pretty image is that of Campbell!—

Led by his dusky guide,
Like Morning brought by Night.

I prevented it being literally realized to me; for I ran up stairs to the parlor, where the fair little

people whom I sought, sat upon the carpet, in the lap of their dusky guide—the amusement and delight, with their strange speech and pretty voices and ways, of all the chamber-maids and waiters of the establishment. The little English speech among the three was possessed by the lovely fairy creature afterwards known among us as “Little Fanny Bethel.” She was, at this time, not more than six years old, small and delicate of her age; and with the tender pale-rose tint of children who have been born, or who have spent their childhood in India. She started up on my approach, advanced a step, and then timidly hung back, raising her mild and intelligent gray eyes with a look of doubt and deprecation. I was more struck with the remarkable expression of the countenance of the little maiden than with the loveliness of her features, and the flood of silky fair hair, which contrasted so singularly with the bronzed complexion and dark eyes of the squat attendant upon whose shoulder she shrunk back. Her heart, revealed through her eyes, gave out meanings which it was impossible that she could herself have apprehended. Her feminine instincts, child as she was, had far outstripped her understanding; and she looked at me with a perplexed consciousness that her fate was in my hands—that she was a friendless orphan among strangers. Happy confidence—or be it credulity, still thrice blest credulity of childhood, which throws itself, in boundless trust, into the bosom of whatever approaches it wearing the smiling semblance of kindness! Little Fanny’s brow and eyes cleared and brightened at my frank accost, and she voluntarily continued to hold by the hand which she had kissed in a pretty fashion of her own. Poor little thing! my heart already yearned over her; her kiss was more loving than a lover’s.

In a very few seconds, nothing seemed to affect Fanny, save a feeling of sisterly responsibility for the manners and bearing of her little brother, in whose behalf she wished to bespeak my kindness, while she introduced him to me.

Tom, who, from the lap of his nurse, had been anxiously eyeing the visiter, was a bold, resolute-looking urchin, with a square and very broad forehead, which he knitted into a most martial frown, when I attempted to take the hand that he clenched and drew back. Master Tom’s attitudes were as valiant in defiance as his sister’s had been gentle in deprecation; but, as I am not apt to fall in love with strangers at first sight myself—nor fond of your very civil and demonstrative people—I winked at Tom’s repulse, and wisely forebore pressing my attentions until they might be more welcome. I was already amused by the little maiden, who, with a look of indescribable childish blandishment, whispered in Hindostanee, and caressed the little fellow, as if coaxing him not to throw away his friend in foolish passion, until Master Tom laughed out with returning good humor, and looked so much handsomer when showing his white teeth, and a mouth wreathed with smiles and dimples, that I made a second attempt to introduce myself, which again instantly overclouded him, and grieved Fanny.

“Poor Tom is so young—dear little fellow!” she whispered in her liquid infant voice, and in a tone between apology, coaxing, and entreaty, which might have melted a savage. I felt that, if all the world were like myself, the faults of turbulent Tom stood a good chance of being forgiven, were it but for the sake of sweet Fanny. While

this passed, the *Ayah* was gesticulating even to sputtering, and addressing me in those shrill tones, which, had I not been well accustomed to overhear the colloquies of my fair neighbor, Mrs. Plunkett, the Irish orange-woman—a title, by the way, this of *Orange-woman*, Peg has, of late, mightily resented—I should have imagined arrant scolding; especially as, in the course of her appeal, her dark eyes continually flashed from me to the children, and shot out lurid fire. So far, however, as Fanny could interpret Hindostanee, the discourse of the *Ayah* was the very reverse of hostile. It was compassionate and complimentary of herself—a daughter of Brahma—upon her sacrifices for the sake of the children, and her exceeding condescension in coming into contact with a vile, degraded, and filthy hog-eating race of Europeans.

By the kindness of the landlady, I procured some warm clothing for the half-naked children; and we set out for London, to which I intended to return by Chatham, that Mrs. Walpole, and my friend Governor Fox, might see their old friend Tom Bethel’s children. If I was not legacy-hunting, I was friend-seeking for my pretty charge. The *Ayah* sat in the bottom of the carriage, by her own request; and Fanny keeping constant possession of my hand, looked from one window, while Tom hallooed from another, as we bowled through the rich meadows and farmy fields of the Isle of Thanet, as light-hearted and happy, as if the fondest parents and the most genial home were awaiting us at our journey’s end.

Tom, by this time, did me the honor to suppose I could play the *tom-tom* very well, and to command a specimen of my powers when we should get home; and with his sister’s aid as interpreter, he communicated many things very interesting to himself, which had taken place at Allahbad, or upon the voyage. Without anything approaching the grace, sweetness, and infant fascination of little Fanny, Master Tom was a manly and intelligent child; and, as the brother and sister, having sung a Hindostanee air and said their prayers, fell asleep in my arms, worn out by their own vivacity, I could not help philosophizing upon the state of society, or rather of factitious feeling, which made a horse, a picture, or a necklace, any mark of conventional distinction—yea, the merest trifle, be considered so important by their high-born relations—and those lovely and engaging creatures, gifted with such admirable powers and wonderful faculties, be considered a burden and a plague. There is nothing of so little real value, save for a few years to the original owners, as those small germs of the lords of the creation. The value of every other commodity is better maintained in polished society, than what is surely, in mistake, called the noblest and most valuable of all. Had Tom and Fanny been a brace of spaniels, or cockers of the King Charles or Marlborough breed, how much easier would it have been to dispose of them.

Governor Fox kept us a day, and treated us with the utmost kindness and hospitality. Black Sam whose amusing tricks probably reminded Tom of his Indian *bearer*, ingratiated himself with the *Ayah* and the children; and the Governor yielded so far to the infantine fascination of little Fanny, as to present her with a lapful of his favorite African curiosities; while he privately assured me, that, if Madam Bethel and the rest failed to do the handsome thing by Tom’s babies, why then he was a bachelor without chick or

child, and he would show them Northamptonshire! This he again solemnly repeated as he put us into the coach for London; and I was not disposed to forget it; for the governor was none of your smooth-lipped professing persons. His word was his bond—and it carried interest, too.

The orphans were received with genuine motherly kindness by my sister Anne, to whom Tom at once gave that place in his affections and confidence which it had taken me three days to acquire. Even yet he admitted of no personal contact, but returned a salute as often with a blow as a caress. The first trial of the children in London, was parting with their dark nurse, for whom we found an opportunity of returning home with a family going out to India. It was Tom's boast that he cried first when *Moomee* sailed away home; but it is certain that Fanny cried longest. The quick sensibility of this child was less remarkable than the tenacity of her grief, which broke out afresh when thus reminded of the loss of "poor mamma," by the absence of *Moomee*. Time, the gracious balm-shedder, usually does his work of healing rapidly with patients under seven years of age—but it was not altogether so with Fanny Bethel; and Tom's perverseness was almost welcome to us as a diversion of her sorrow. Yet Tom's rebellion scarcely deserves so hard a name. Accustomed to a train of Indian attendants anticipating every wish, studying every glance, and following every movement like silent shadows, Master Tom, in a London nursery, felt like a deposed prince, and was quite as ready to play the tyrant when an occasion offered. The turbulence, caprice, and open rebellion in which he had been encouraged by the Ayah, had threatened to subvert the mild despotism of Mrs. Gifford, my sister's confidential nurse, who, for eighteen years, had been as supreme above stairs, in her legitimate territory, as was my brother's will in the parlor, or his wife's pleasure in the drawing-room. Master Tom had, in a rage, torn her best lace cap, threatened to throw her shawl on the fire, and kicked her shins. The free-born spirit of an English nurse could not brook such treatment. "Did Master Tom fancy she was one of his black nigger slaves?" So, if he kicked, she cuffed; while poor little Fanny was the deepest, if not the only sufferer of the three. What was sport to Gifford and Tom, was to her death. Soothing down Tom's passion, pleading and apologizing to Gifford, and weeping, while, like the Sabine women, she threw herself into the strife, little Fanny would clasp her brother and address the nurse, whispering, in that voice which no one could resist—"Poor Tom is so young, dear little fellow—and he has no mamma now to make him good." It was then the subdued Gifford's turn to apologize; while Tom himself would volunteer a fraternal kiss, as if already manfully conscious that the slightest atonement, on his part, ought to be thankfully received by Fanny. This is a lesson which little brothers learn with astonishing facility, even when it is not directly taught, and sometimes when the very reverse is apparently inculcated.

"Gentle and easy to be entreated," Fanny appeared the obliged party upon all such occasions of general reconciliation; for, to her sweet nature sullenness or unkindness was the bitterest form of suffering. To live surrounded with cold hearts and scowling or averted eyes, was blighting and misery. In the few weeks the children remained with us, Fanny endeared herself to our whole

circle; nor did Tom want friends and admirers, who were willing to place his faults to an Indian education. Along with little Fanny's singular sweetness of nature, was the fascination of her ever-wakeful and watchful affection for her little brother. She already seemed his unconscious guardian angel, whose salutary influence over his wayward moods was daily upon the increase. Though Tom, in his violent fits, would meet a sugar plum, a sugared promise, or a menace, alike with a blow, he would look serious and try to command himself, when he perceived how much he afflicted Fanny.

While the children were displaying their natural characters in such childish ways, Mrs. Dr. Bethel was making her calculations at Stockham-Magna; the result of which was, offering to take charge of Fanny, and to educate her along with her own two daughters. But, for the boy! "She was indeed at a loss what to do with her own son—women were so inadequate to training boys even in their infant years."

It was not unreasonable to imagine that Mr. Bethel would charge himself with the education of both his nephews; and it is certainly easier to receive a little girl into a family where there are already girls, than to maintain a youth at school and college. In the following week, I escorted the children and my sister, who made a long-promised visit, to Stockham-Magna. We had a charming excursion. It was now near midsummer—the pride of the year in the pastoral and woodland country we traversed. And then the Rectory of Stockham-Magna itself! I had never seen so picturesque, so natural, so perfectly English a resting-place for the musings of divine philosophy—for dignified intellectual repose and calm meditation. Neither the district nor the particular spot boasted any bold original feature of scenery. A grassy vale, or, as probably, a rushy one, a stream, and a few knolls and slight inequalities of surface, formed the groundwork from which this abode of learned leisure and pastoral care had been fashioned out centuries before, and gradually moulded into its present beauty. Episcopalian superintendence had preserved and perfected what Popish taste had projected and so far completed; and Time, with his ripening and mellowing touches, had harmonized the whole.

The buildings were of what is called the Elizabethan age—a phrase which I defy any man to define; though, popularly, it is very well understood in its application to whatever form of dwelling, be it manor-house, farm-house, or parsonage, that is irregular and antique, graced with tall clustered chimney stacks, quaint windows, and an infinity of intricate adjuncts, forming a picturesque whole. But, if those arched and lancet windows and doorways, glancing from the rich sylvan garniture of ivy and trailing plants, like the bright face of a young beauty half veiled by her dishevelled ringlets, were of the happy age of Elizabeth—for I hold them of much older date—surely those magnificent trees were of more ancient growth. Both looked as if they had flourished in undisturbed tranquillity for centuries. The old walnut trees, of prodigious size, which stood near the house, were probably finer specimens of their kind than those avenues of beeches leading to the "willow brook" and piece of water, (beyond the massy garden walls,) in which the swans, at this hour, appeared floating as in an inverted sky, or as if nestling among the trembling shadows of the

bordering trees. And everything was so trim, and in such high yet easy and enjoying habitable order—there was such entire freedom, with unobtrusive neatness.

My pretty companions were enchanted, as I imagined, with the first view of their future home; but I subsequently discovered that the small delicate spaniel and the greyhound had attracted my friend Tom's regard, while Fanny rejoiced in those troops of doves that, on the roof of the porch and at every "coigne of vantage," were cooing, in drowsy murmurs, as they luxuriously basked in the sun. Truly some small portion of that part of the national wealth called the great tithes of Stockham-Magna, could hardly be better expended than in preserving the beauty and order of this ecclesiastical abode, had it been no more than as a picture and ornament to the neighborhood. Dear, good, and haply honest and enlightened church reformer, wheresoever your zeal may carry the besom and direct the ploughshare, do, in the name of natural taste and gentle antiquity, spare me the Rectory of Stockham-Magna! By the memory of the hundreds of solemn festivals and holiday tides, and of the wakes and processions which it has witnessed—by the ever fresh beauty of that terraced garden—by those clipt monster yews, and that box-hedge, broad and high as the walls of ancient Babylon, the wonder and pride of the county—by that quaintly-carved, heavy dial, with its rich and cumbrous masonry:—by all this, and by the mightier conjuration of the memory of good men's feasts, and of those social charities which, long gathering in a hundredfold, dispensed at the rate of ten or five—spare me this one cosie nest of the life called holy and the leisure named learned;—this pleasant land of drowsyhead, where a succession of mild, gentlemanly persons for generations lived a tranquil, elegant, semi-sensual life, undisturbed by Methodists, Ranters, Radical prints, and the Schoolmaster:—spare me but this one memorial of the times when as yet the reverential peasantry had not surmised, that warmer affection for their pigs and corn-sheaves emanated from the Rectory, than for either the comfort of their bodies or the care of their souls.

The appearance of a lady's cap, at one of the embowered lower windows, must have recalled the wandering attention of little Fanny, and the noise of the chaise-wheels on the instant brought all the Bethels of Stockham-Magna to the porch, to welcome the orphans of Allahbad. "Oh, Tom, do be a good boy!" whispered Fanny, kissing him, as she anxiously adjusted his shirt frill, and shaded back his hair, while the carriage drew up.

"Aunt Bethel" performed her part very well. She received the orphans in her maternal arms with good and graceful effect; spoke not too much; and, while she gave her hand to my sister, suppressed the starting tears. Fanny pressed her lips to the lady's hand in her own sweet fashion; and, alarmed at Tom's sturdy backwardness, whispered, in her pretty imperfect English, her wonted apologetic—"Tom is so young, poor little fellow!—and he has no mamma now to make him good." Every one was melted. Her two cousins, Harriet and Fanny, affectionately kissed "Allahbad Fanny," and shook hands, almost in spite of him, with Tom, whom their brother Henry soon carried off on some boyish quest—Fanny's eyes anxiously following them, as if she were afraid that her turbulent charge might, in some way, compromise himself with these new friends, even in the first hour.

The ladies were now engaged in conversation; and it was from me, to whom she sidled up, that Fanny entreated leave to follow "poor Tom." The leave was instantly granted by Mrs. Bethel; and the children, in the glow of novelty, went out in a group. It was now that my sister eloquently expatiated upon the sweet disposition and affectionate nature of little Fanny, her gentle docility, and remarkable attachment to her little brother. "Poor little creatures! they love each other the better for having nothing else to love!" was her concluding observation, while tears glistened in her eyes. My good sister, perhaps, showed more tenderness than discretion, in thus addressing the future patroness of Fanny; but that lady, a rigid and zealous worshipper of all the family of the Decorums and Proprieties, performed her part to admiration—neither overdoing, nor yet falling short of what ought to be expected from her, or was due to position and circumstances.

Our stay, which was to have been for a fortnight, was with difficulty prolonged to a week. My sister, upon hearing that some of her children had colds, affected fully as much home-sickness as she really felt; for the studious observance of every right of hospitality, and the most scrupulous politeness, did not compensate for a certain feeling of restraint, a lack of that frank, social, cordiality which it is much easier to understand than to explain. Our mutual sympathy on these points, and our affection for the orphan children, made us both sedulous though tacit observers of the characters of those among whom they were thrown.

In the disputes which early arose between the boys, though Mrs. Dr. Bethel, like a female Brutus, gave judgment against her own son, on consideration of Tom being a spoilt child, of little more than half his age, it was easy to see to which side her heart inclined. Then Tom, with his tricks and wilfulness, kept her in a state of perpetual nervous apprehension. He was forever in perils or scrapes, and seducing his cousins into like adventures. Nature had stamped him a bold, resolute, daring imp; and his five months' voyage had confirmed the tendency. Now he was tumbling into the pond; now embarking in tubs on voyages of discovery; next plunging into the dog-kennel, or running among the horses' feet; and encouraging Henry to climb the walnut trees, up into which the unbreeched urchin would leap like a squirrel, laughing at the screams and remonstrances of nurse-maids and cousins.

But Fanny was naturally as tractable as Tom was rebellious. It was astonishing how soon she learned, as if by instinct, that she was to have no will, no property, no pleasure, that was not at the sufferance and mercy of her cousins; because her name-sake, Frances, was "such a child," and Harriet's health "was so delicate." It was equally astonishing how quickly Tom, as if by a similar instinct, constituted himself her champion, and did battle for her rights, in the nursery or the garden, in spite of herself, and long before he understood the language of those around him who were invading them.

Among the toys which Fanny had brought from London, was a Dutch milkwoman in complete costume, which Harriet, who loved everything that was novel, and admired whatever was not her own, appropriated without much ceremony; and which Tom reclaimed with even less. In the struggle, the Dutch lady was denuded, and Harriet, who was at the age when children shed their

teeth, lost one of hers in the fray, and was brought bleeding into the drawing-room, followed by a maid dragging in the sturdy culprit, accompanied by the weeping Fanny. One might have excused a mother for being at first alarmed and offended, though the criminal was almost an infant; but what came out, in the course of investigation, ought to have produced a more impartial judgment and a mitigated punishment.

But Harriet's tooth was gone, and it had been followed by a few drops of blood and torrents of vengeful tears; and she protested that she did not mean to keep the Frau Jansen—the Dutchwoman, the unlucky Helen of this new Trojan war—but only for a day or so, to look at her. Tom was summarily adjudged to solitary confinement in the housemaid's broom-closet, on the attic floor, and was led off, persisting in dogged silence, while Fanny sobbed as if her little heart would burst. From that hour, open hostilities were proclaimed between Tom and the family, which never again ceased for many years, save during some temporary, and always hollow truce.

When I left the ladies in the drawing-room after dinner, on the day of Tom's punishment, I sought the children in the wilderness, where they generally went, with their attendant, at this sultry hour: but no Fanny was there.

"She is naughty, too," said her little namesake, tossing her head with the air of a small woman and a thorough family partisan. I followed up the adventure by seeking out my little friend. She was sitting on the garret stairs, at the door of Tom's prison, whispering to him through the key-hole. The sight of a sympathizing friend—for nature had already told her that I was one—made Fanny's tears flow afresh, and she began to sob out her little apology, as senseless, perhaps, as the reiterated wail of a lapwing, but as plaintive—"Poor Tom is so young, poor little fellow," &c. &c. I played the discreet part for once, and led her to her aunt. Tom was released, on our joint pleading—an amnesty was proclaimed—and Frau Jansen, like one of the wantonly-sacrificed minor powers at a general pacification, was made a bonfire of.

We left the Rectory next morning, Fanny weeping abundantly to part with us, while Tom would have been well contented to return to London, which he proposed to do, had his sister not been condemned to remain behind him. I have seldom seen my sister Anne more affected, than when we fairly got out of sight, and when she first gave unrestrained way to her feelings—a tender mother's foreboding feelings for orphan children!

That dear little Fanny!—how perilous to a creature situated like her, were those gifts which nature had so lavishly bestowed—that tenderness and quick sensibility to which the contact of the cold and the selfish must bring either blighting or perversion!

Turbulent and rebellious as Master Tom continued to be—a care and often a grief to his sister—I believe he was her greatest blessing too; for, with all his faults, he sincerely loved her, and he was one being on whom her affectionate feelings could expand themselves unchecked. No one, I believe, brings into this world a heart like Fanny's, without finding something to love, even in the very worst circumstances: but Fanny found so much to love in every one with whom she came in contact, until Tom, as he grew up, began to despise the affection she bore to many persons whom he hated,

as girlish *polltroonery*, or almost meanness; and he even charged her with hypocrisy in her attachment to an aunt who had not been too kind, and to cousins not too gentle. But Tom durst not persist in an accusation to which his heart gave the lie as strongly as did Fanny's silent tears.

Tom had been early sent off to school with his cousin Henry; and when the returning holidays brought the boys to the Rectory, the Allahbad Bethels, in again meeting each other, were almost as happy as the children gathered beneath the wing of their mother. Then came a full interchange of hearts and confidence, as with intertwined arms the orphans wandered away together through the woods and dells of Bethel's court, which converged on the narrow grounds of the Rectory. Tom was more and more astonished, and almost angry, in every succeeding year, while he was below fifteen, that Fanny had so little or rather nothing to complain of—no quarrel that he could adopt—no enemy on which his prowess might revenge her.

In all this time, I had never seen Fanny Bethel nor her brother, though I had occasionally corresponded with both. Indeed, I believe that I was for some years Fanny's only correspondent; and, as my epistles always accompanied my sister's well-executed town commissions, and presents of toys and books for the Rectory children, they were probably tolerated, if not welcome.

For the first six years after I had seen her, Fanny partook of the instructions of the governess Mrs. Bethel had engaged for her own daughters; and, blessed with a humble, loving nature, inekness and submissiveness cost her less effort than any other creature I ever knew—and I believe that her childhood was not unhappy. But a more critical age was arriving, and Providence was silently opening up new resources to the orphan girl.

"The sisters of Mr. Whitstone, the rector of Stockham-Magna, had, some years after the arrival of the Allahbad Bethels, settled in the neighboring town of Wincham, to be near their brother, who, though his nominal residence was the Rectory, oftener lived with them. These respectable old maiden ladies, the daughters of a deceased clergyman, were, of course, as near in degree of kindred to Mrs. Dr. Bethel as was their brother, though she never seemed to know this. The younger, Miss Rebecca Whitstone—though younger was here but a relative term, for she was almost fifty—was merely a good, plain, useful, and active person, sincerely devoted to her brother and her eldest sister, Miss Hannah, who had obtained over her the influence which a strong mind is said to hold over a feeble one within its range. The latter lady had been an invalid from a very early age, in consequence of a fall from horseback; and, to afford occupation and exercise to an uncommonly active intellect, she had afterwards received from her father what is termed a learned education, which, however, had none of the effects that learning is said to produce upon female minds. She did read the classics in the originals—for that was her solace as she lay the livelong day upon the couch to which her helpless lameness confined her; and she studied the sciences; and in astronomy, in particular, was believed, even by her brother's old college companions, to have made astonishing progress; and not "for a woman:"—that mortifying qualification was, in her case, withheld. Simply, she had made astonishing progress and even discoveries, in sci-

ence. With all this deep learning, and a taste for refined literature, Miss Whitstone was a woman of magnanimous feelings and high principles; pleasant, kind, and social in her manners: tintured with high-souled romance, and yet not above her surrounding world of Wincham. She also possessed a flexible vein of humor, which had made her conversation exceedingly captivating to young and old, before her acquirements had risen in judgment against her; and Miss Whitstone's invalid chamber came in time to be, after a certain hour of the morning, the levee-room of the privileged talent and modest worth of Wincham. It was the rallying point of its best, if not its finest society; though, this being a small town where no one was liable to be compromised, the very finest—yea, even stray specimens of the "county people"—were among Miss Whitstone's occasional visitors. It was even said that matches had been, if not made, yet certainly helped on, around her invalid chair; though the parties were not of such consideration as to make Mrs. Dr. Bethel desirous (now that Harriet was twenty, and her own Fanny seventeen) that her daughters should often appear among the learned lady's bonny *blue belles*.

If there be such a thing as sympathetic attachment—and I am sure there are spontaneous feelings which are quite equivalent to it—such had grown up between the invalid Miss Whitstone and the orphan Fanny. The rector himself came, in time, to partake of an affection so warmly felt by his favorite sister; and the notable Miss Rebecca, moved by these considerations, and the gentleness and good looks of the child, early and kindly began, characteristically, to attend to little omissions and flaws in gloves and ribbons, and shoes and stockings, which a mother's eye prevented from appearing in her cousins. During a year that those young ladies were sent to a first-rate finishing seminary near London, Fanny, who had often spent happy days, weeks, and months, with the poor Miss Whitstones, lived with them altogether, to enjoy the advantage of such masters as chance and the London holidays relieved, by changing the scene of their professional fagging, from a very great town to a very small one.

One of these was a drawing-master whom I had introduced by letter to the Miss Whitstones. It was certainly a misfortune—but, in this locality, no ineradicable blot—that the rector's sisters, for a certain part of the year, let their first floor to such respectable lodgers, as being single men—and certainly *gentlemen*—were well recommended to them. Mr. Edmund, the gentleman I had recommended, was a painter, and a gifted one, as was proved by the beautiful contents of his portfolio, and a few finished cabinet specimens which he carried down; but he seemed to receive little or no encouragement in Wincham to open classes for teaching his art; and he spent his time, either in reading or rambling about the surrounding country, of which one of the most attractive spots, to an artist, was the beautiful park of Bethel's court. Miss Rebecca was concerned that a lodger so regular in all his habits, so gentlemanlike in his manners, so nice in his linen, and so punctual with his bills, should find no pupils; and Miss Whitstone, stretched upon her invalid couch, was doubly vexed, first, because it must be annoying to a man whose business is to teach drawing, to have no one to teach; and secondly, that she could not afford to engage his services wholly for Fanny,

and thus an opportunity might be lost such as was never likely to recur—for when would so masterly an artist again appear in Wincham? Besides, Fanny had a decided genius for painting. Miss Whitstone had, indeed, a knack of discovering natural genius for everything high and amiable in Fanny. Her first delightful discovery had been Fanny's exceeding *genius* for loving, and especially for loving her brother Tom; while to Fanny, Miss Whitstone's earliest, and still dearest charm, was discovering good qualities in "Poor Tom," even in his perverse early boyhood; which no one else would allow. "Give a dog an ill name and hang him," says the proverb; and the converse holds as strongly. Miss Whitstone was ever anxious to find out, and place in the proper light, young Bethel's good qualities; and they germinated and expanded in the warmth of her generous culture and encouragement, while others could only perceive the ill weeds waxing apace. Fanny, who had, for several years, been her amanuensis, never performed that duty with more good will, than when Miss Whitstone wrote to Eton to Tom, sending him those affectionate counsels which his respect for her made effectual for the moment, and which, in tenderness, only a mother could have exceeded; and those directions for his subordinate studies which few mothers have the power of giving, and not many fathers.

From the time that he had, at three years' old, traversed so much of the wide ocean, Tom's decided vocation had been the sea. This would seem almost an instinct with some boys, as if implanted by nature to facilitate the intercourse and promote the civilization and happiness of mankind; and Tom Bethel was of the predestined salt-water number. But this uncle, who had never yet seen him, had decided that Tom, the would-be sailor, should be Thomas the forced divine; and the boy had no choice save submission or running away to sea, which he would willingly have done at every school vacation, save for Fanny's sake; but, as Tom advanced nearer the years of discretion, he began to think better of a mode of life which, as soon as he got through the university, and one of the family livings fell vacant, opened a home to that gentle sister. He would even have submitted to the death of Mr. Whitstone as soon as he had obtained orders himself, and have felt no remorse at depriving his aunt of her alleged simoniacal share of the great tithes; because he squared this want of affection to his own conscience, by arranging that Miss Whitstone and Miss Rebecca could then live with Fanny and himself at the Rectory, like gentlemen; and give up letting first-floors to itinerant painters and drawing-masters. Tom, as a male branch of the house of Bethel, though one of the barest, had not been for seven years at a public school, without acquiring ideas of family consequence and of *style* quite beyond those of his sister; though, on some points, they were qualified by generous exceptions for plebeian friends.

In the first season of Mr. Edmund appearing at Wincham as a portrait-painter without sitters, and a drawing-master without pupils, he had been tolerated by the lively Eton lad, in consideration of Miss Whitstone's esteem, what Tom reckoned his unobtrusive modesty, and the quiet refinement of his manners; but, in the second summer, when Tom found him almost domesticated in the family parlor, and the companion of Fanny in sketching-practice excursions round the country, the young

gentlemen—and he was not quite sixteen—took an affair in dudgeon, which had already been seriously discussed in Miss Collins the milliner's back-shop, by her best customers, and at more than one tea-table of the town. Now, in Wincham, Allahbad Fanny was a general and a great favorite; which was the more remarkable, as she had never courted popularity, and was in no condition either to grace with her favor, or patronize by her interest. Howsoever it may fare with other country towns, I can assure my readers that a young lady who enjoyed the united suffrages of Wincham, was in circumstances as rare as enviable. And even now there was censure; but Miss Whitstone, with her learning and her odd ways, was more blamed than Fanny Bethel, for those rural outbreaks which were held a gross and daring innovation on all the ruled proprieties of this community. That the curate's orphan daughter, Patty, whom her aunt, Miss Collins, was educating for a governess, shared in Fanny's lessons, and generally in her sketching excursions, was a shallow blind, at which they and Tom Bethel laughed outright, the latter angrily.

As for Miss Whitstone sanctioning this kind of intercourse—learned, clever, and excellent woman, as she undoubtedly was—how, as Tom justly thought, was any provincial elderly lady, such as she, to know the world and mankind like an Eton scholar! As the natural protector of his sister, it was become Tom's duty to interfere, and to assume a part which female guardians and friends had so obviously neglected. No time was to be lost. But how was Tom to scold Fanny—that dear, kind, generous, and most disinterested creature, whom every one loved—yes! even worldly Aunt Bethel—who, from infancy had had no hope, no joy, no being save in him! No! Tom could not scold, nor even remonstrate; but he heartily abused both the Mesdames Bethel, who so improperly deserted their duty to their orphan niece; and then playfully, or at least in a way Tom meant to be playful, he rallied Fanny first upon her intimacy with all the vulgar spinsters and dowagers of Wincham, and next upon her new passion for sketching from nature. Fanny's blushes and evident distress stopped the current of Tom's wit, and quickened his fears; and now he reminded her, still with affected pleasantry, (for Tom was very sly,) of her birth as a Bethel, beggar Bethel as, in the mean while, she was; and of the matrimonial distinctions her eminent personal advantages and family connexions entitled her to look for, were she only placed where she ought to be, and thus seen, admired, and courted by the noble, the wealthy, and the honorable. Fanny laughed now, and Tom was displeased. There was implied ridicule of his judgment and knowledge of life, in the tone of her laughter; and these were points on which Tom was at this time very susceptible; yet he would have forgiven this in consideration of her secluded education, and innate modesty and humility of character, save for the many cross accidents that were arising to mar her splendid fortunes. Her cousins had lately returned from their finishing school, and lengthened visits to fashionable friends and relatives; with much of that high-toned air, that *manner and style*, so captivating to Tom and his brother Etonians; and in which Fanny, retiring, shy, sensitive, was still so lamentably deficient. That his own sister, "Little Fanny," as she continued to be named, long after

her graceful pliant figure overtopped all the females of her family, was beyond comparison a lovelier, and far more *loveable* girl, than either the cold, stately, fashionable-looking Harriet, or the vivacious, pretty, petulant Fan, he was most reluctant to doubt; but then, schoolboys imagining themselves youths, and college-lads fancying themselves men, had admired the thorough-bred air and style of the Rectory Bethels, at a music meeting, and had altogether passed over Allahbad Fanny, who had been left to the attentions of Mr. Edmund her drawing-master, and a little good-natured notice from her cousin Henry, who had always been kind to her. Now, the above were immutable authorities with Tom in all questions of taste. It is true, Henry Bethel, who was also becoming a judge of ladies, wines, and horses, and who, moreover, was now of Christ Church, made some atonement, by declaring, after a couple of bottles of wine, that, though his sister Harriet was certainly a showy, dashing girl, and Frances a pretty creature enough, neither were to be compared in a summer's day with little Allahbad Fanny; and he concluded by wishing that he were a rich man for her sake—though his mother must not hear of this. Tom, both gratified and resentful, was compelled to gulp as much of this declaration as his pride could not swallow; and now he fancied he had found a cue to Mrs. Dr. Bethel giving up so much of her niece's society to "poor cousin Whitstone, to whom little Fanny was always such a comfort." It is probable that Mrs. Bethel had not very overwhelming fears of immediate danger from a constant domestic intercourse between her niece and her son—still, it was prudent to be guarded. Her daughters were now to be introduced into life; and she felt that two marriageable young ladies were quite enough at a time in one family. Two young ladies might be admissible into small social parties, where three could not be thought of. Besides, Mrs. Bethel was prudently doubtful, how far it was proper to give Fanny a taste for gaieties and a condition of life that she had so slender a chance of permanently enjoying. Of her personal attractions she really was not afraid. A mother's vanity had probably blinded her to what to every one else appeared her main reason for rarely producing her niece along with her daughters. The master of the Free Grammar School of Wincham, a *protégé* of Miss Whitstone's and an estimable young man, who had lately obtained the Lectureship of St. Nicolas, was understood to admire Fanny, and only to wait for some better piece of preferment to make his proposal in form; and Mr. Edmund, the artist, also a highly respectable young man, with remarkable talents, and one, who, if properly introduced and pushed in London in the portrait line, could not fail to realize a handsome income, and probably to keep a carriage, was believed to be deeply attached to his pupil; though Fanny herself, when questioned, denied the possibility of this attachment, even with tears. Mr. Edmund, she said, though at first he seemed to like her society, probably for the sake of Miss Whitstone's conversation, and from the love of his art, to which Fanny was for the time enthusiastically devoted, had been silent, distant, and almost studiously cold in his manners to her, particularly of late. He could have no thoughts of her.

"Well, child, there is no use crying about it, at any rate," said the aunt; "but, as I do not, on such grounds, give up my own opinion, I shall

write to-night to Mr. Richard Taylor, inquiring farther about the gentleman." Fanny, horrified by the indelicacy of this proceeding, implored her aunt's forbearance, and protested again and again that Mr. Edmund's attentions to herself had been only those of a friend and amiable instructor, to one whom he considered merely as a child; but she betrayed so much emotion in her denial, that Mrs. Bethel, with one of her discomfiting, keen, worldly, penetrating looks, abruptly turned from her, and went to Miss Whitstone in the next room, whom she bluntly taxed with having suffered Fanny to entangle her affections with this "paragon painter." The accused lady as flatly disclaimed the instrumentality as Fanny herself could have done the deed; but she acknowledged that, if old signs held, Mr. Edmund, into whose praise she launched with animation, did seem, and that, indeed, for successive years he had seemed, to feel a very deep interest in her young friend; and, moreover, that Fanny did not appear indifferent to his opinion of her.

Mrs. Dr. Bethel did not lose a post in inquiring into the character and professional prospects of Mr. Edmund; and I did not keep her an hour in suspense. The character of the gentleman was everything that could render a reasonable and amiable woman—and, above all, one of the quiet, affectionate, and humble character of little Fanny Bethel—perfectly happy. His talents, as an artist, spoke for themselves—they were eminent—but his professional prospects depended entirely upon his own industry and perseverance. The answer was perfectly satisfactory to Mrs. Bethel; and she resolved to have an explanatory communing with Mr. Edmund next day; and wrote to him that, if everything was as she imagined, she would not hesitate to give her sanction to his addresses to her niece, which she had no doubt would be followed by that of the family abroad.

Poor Fanny was in an agony of distress. She would at the moment, have gladly consented never to see Mr. Edmund again in this world; never listen to his delightful conversation with Miss Whitstone; never again enjoy one of their social reading evenings, or one of those charming sketching rambles, in which his conversation was, if possible, still more captivating than at other times—though it was not easy to recall much of it—rather than that he should imagine her the indelicate, forward, unwomanly, vain girl, who had so grossly misconstrued and misrepresented his attentions, that he must now be subjected to the coarse questioning of her relatives.

This was certainly the most wretched day of Fanny Bethel's whole life. Twenty times she began to write to Mr. Edmund, protesting her own innocence, and her horror at the course her aunt had followed; but natural timidity, and the same delicacy of feeling which prompted this bold step, prevented its execution. She applied to Miss Whitstone, who was also become uneasy and perplexed between her young friends, though, upon the whole, pleased with the prospect of an explanation, which, she was assured, would produce satisfactory results.

"But, my dear Fanny," said this lady, with a certain air of benevolent humor—"let me exactly understand what I am to say to Mr. Edmund:—That you are not in love with him!—but that might have been left to my own discretion. Or is it that you do not believe—never did believe—nor ever will believe, that he is in love with you?"

Fanny wept from vexation. "Dear ma'am, I am sure you understand quite well what I mean."

"Indeed, I think I do—but cannot be sure. But here comes Tom, who may help me. Do you know that all the gossips of Wincham are obligingly giving your sister Mr. Edmund as a lover, Tom?"

"And that she disclaims him as such, and the honor altogether," cried Tom, petulantly.

"I do!—I do!" exclaimed Fanny. "Mr. Edmund think of me! Good heavens!—With his fine talents and genius, and thousand, thousand amiable qualities, to think of poor little me!—foolish me, who always feel like a child beside him, and who was never so happy as when, long ago, he treated me as one!"

"Confound your humility, Miss Fanny Bethel!" cried the Etonian. "It is somewhat out of place."

"How was it possible that Fanny could believe any man could admire so disagreeable and plain a little girl as herself?" said Miss Whitstone, laughing. "Yet, even in the case of Mr. Edmund, it is, in my humble judgment, a conquest she may very well be proud of, yet without doubting its absolute possibility."

"Proud, ma'am!" returned the fuming Etonian, only restrained from the violent expression of anger by his deep respect for Miss Whitstone. "Give me leave to say, ma'am, that, though any man—ay, any man in all England—might be proud of gaining the affections of Captain Bethel's daughter—of my sister Fanny, ma'am—I see no occasion for her being overpowered with gratitude for the attentions of any gentleman whatever, even although his birth and station in society entitled him to address her."

Poor Fanny had never in her life felt so self-abased as by this attempt to exalt her; and, almost inarticulately, she implored her brother to say no more on the subject, and gave way to another burst of tears; while Miss Whitstone, frankly extending her hand in amity to Tom, declared that they had come exactly to the same conclusion, though from different premises—"There was, indeed, no man in England, whatever his rank or fortune, who might not be proud of gaining the heart of little Fanny—by her own self, Fanny." Upon this, Tom kissed his sister, and playfully adopting the language of his childhood, promised to be "a good boy, if Fanny would not cry no more."

There was thus the appearance of sunshine after showers, when Fortune, who delights in games of cross purposes, sent Mr. Edmund himself into the apartment, which he entered in some haste. Tom was still hanging over Fanny's chair, and Fanny had been in tears. The painter looked with interest to the brother and sister, and with meaning to Miss Whitstone, as if he required her permission to remain. She invited him to sit down; and Tom, with a sudden assumption of the dignity becoming the presumptive heir of the mortgaged acres of Bethel's Court, drew his sister's arm within his own, and, bowing slightly to Miss Whitstone, said, "I require Miss Bethel's presence in another apartment, ma'am." The lady smiled in mingled pity and amusement; but anxiety for Fanny was predominant over every other feeling, and she was glad when Mr. Edmund very naturally led to the subject, by remarking, with a smile, "Tom Bethel is in his altitudes to-night—but I am sure he loves his sister."

"More than his life—I'll say that for him," returned Miss Whitstone: and a conversation was

begun which Fanny fancied would never end, and during which Tom returned to his present headquarters at the Rectory. When Fanny, after Mr. Edmund had withdrawn, ran in to say good-night to her friend, and, perhaps, to hear all she could hear without the direct inquiry she could not venture to make, Miss Whitstone informed her that Mr. Edmund was suddenly called away, and had left his farewell compliments for her, as he was to set off by the mail at midnight. Poor Faany! Miss Whitstone was too generous to look at, much less to speak to her. She sent her away to search for a book; and Fanny returned in ten minutes, protesting that she was so thankful Mr. Edmund was to go, as this would disconcert the horrid scheme of her Aunt Bethel.

Next morning, rather earlier than her usual hour, Fanny appeared at the bedside of her friend, looking pale, perhaps, though she seemed almost in flighty spirits, while she craved leave of absence for a morning's ramble in the woods of Bethel's Court, with only Patty Collins.

Before this plan—to which Miss Whitstone consented, with silent, meaning caresses, that drew grateful tears from her favorite—could be put in execution, Mrs. Bethel's carriage drove up to the door, with the whole family of the Rectory. Letters had been received that morning, announcing the death of Mrs. Bethel at Aix-la-Chapelle, an event which changed the whole prospects of the family, to whom her large independent fortune was thus completely lost. And Mr. Bethel might marry again, and Tom and Henry thus be thrown back in the succession to even those poor remnants of the original property, which, meanwhile however, Mrs. Dr. Bethel had a shrewd notion were bartered beyond their yearly revenue.

While despatching notes, receiving condolences, and looking over silks and muslins, crapes and bombazeens, and giving orders for mourning, Mrs. Bethel could yet find time to notice, sarcastically, the precipitate retreat of Mr. Edmund, to whom she had intimated her wish for an interview and explanatory conversation at the Rectory.

"I cannot allow myself to believe that it is indifference to the subject of the intended conversation, which has made Mr. Edmund avoid you at this time, cousin; or anything but the simple reason he has assigned—business. But I may refer to his note for your better information." Miss Whitstone handed the sealed letter, intrusted to her, to the lady to whom it was addressed, and who tore it open without farther ceremony, and rapidly skimmed the contents.

"Well, this is very proper now; and quite well expressed. He does propose for Fanny, or means to do so, as soon as he obtains the consent of her natural guardians. I can answer for Mr. Bethel—and as to myself.—Well, I am pleased at having brought the man to the point. This late heavy loss makes Fanny's marriage, in almost any respectable way, more than ever desirable. Her sole will now have more than enough to do with himself. My own children are just at the age when the expenses of a family come to be seriously felt. How Tom's clerical education is now to be carried through, I cannot foresee. Perhaps your brother may get him to the university as a sizar—though the sea, to which he seems born, and for which he has so strong an inclination, might be better still."

There was but one reason against oversetting Tom's present views. If Fanny were once fairly

married, and if Tom obtained one of the family livings, there might be a *pis aller* for her youngest daughter. But, at present, she had a first duty to perform, and, snatching a pen, she instantly wrote her full consent and approbation of Mr. Edmund's addresses to her niece, with many well-turned compliments to himself, and phrases of maternal endearment in relation to Fanny. Miss Whitstone, having twice hinted, "Are you not precipitate, cousin, with the death of Mrs. Bethel so recent?" looked silently on, until the letter was folded, when she obtained an answer. "Not a bit too precipitate, cousin. The sooner little Fanny is settled the better. The small—the very small allowance her uncle has hitherto made me for her, must stop with the death of his wife; and this Mr. Edmund says, he must have three or four months to look out for a proper house, and so forth:—even if he be so far fortunate as to obtain the consent of my niece—of which, by the way, I dare say, he fancies himself tolerably certain—and the approbation of her relations—of which I now give him joyful assurance."

"And, in so doing, you make him a happy man, I am persuaded. But there is Tom Bethel to be consulted next—whose ideas of Fanny's deserts are so high and so just."

"Tom Bethel!—a headstrong, foolish boy! No, cousin, we may make Tom a bridesman; but to consult him about his sister's marriage, is entirely out of the question. But here comes Miss Collins. Now, I fancy something very slight and plain may do for Fanny's mourning, as she is so quiet at present with you; and we must save all we can, you know, for the *trousseau*."

Miss Whitstone allowed the lady to have it all her own way; though Tom, in a rage at afterwards finding his sister's mourning for their aunt, scanty, and much inferior in quality to that of his dashing cousins, remonstrated loudly upon that injustice—threw Fanny into a paroxysm of grief by his violence in her cause—and filled the ladies of the Rectory with such indignation that they upbraided him with ingratitude. This Tom denied; accusing Mrs. Bethel, in turn, of having made a *job* of his sister, for whom she had a handsome allowance, and a slave of her for so many years. The polite, politic Mrs. Bethel had never met with anything so provoking in her whole life as this schoolboy affair. It became the talk of all Wincham; and Tom found numerous partisans, who seized the present opportunity of reviving the old story of Mrs. Dr. Bethel's secret bargain for the lion's share of the great tithes of Stockham-Magna. The controversy even went the length of mysterious paragraphs in the *Wincham Journal*; and was only ended by Tom becoming convinced, that, if it were carried farther, the affair would be Fanny's death. She was, indeed, looking so wretchedly ill, three months after the remains of her aunt had been brought home to be laid in the family vault, that, when Tom next came from school on a visit, he flew to Miss Whitstone's room, in the deepest distress, to inquire if his sister was not in a consumption. Miss Whitstone hoped not. Fanny had not been well. She was in unequal spirits, and thinner, and paler; but without any decided ailment.

"She is pining for that fellow, Edmund," Tom cried, with a glowing face; "to whom her kind Aunt Bethel, would have given her with so little ceremony; and who does not seem in a hurry to claim the hand he once pretended to value so

much. Forgive me, Miss Whitstone: you are the only human being, save Fanny herself, in whom I have confidence, or to whom I can look for sympathy. I am sure if I knew what was best for poor Fanny, to whom I owe everything, I would do it, if it broke my own heart." And the subdued youth wept.

"That duty should not be heart-breaking, Tom. Your sister, with the tender and very uncommon ties that from babyhood have knit you together, would receive far more pleasure from your single approbation of her choice, than that of all her other relations put together. Your pride, Tom, or your prejudice, call it which you will, has been far more distressing to your sister than all her other trials. And you wrong Mr. Edmund:—he only waits her slightest intimation to fly to her; but while every week brought a fresh heroic epistle from you—indeed, you must forgive my freedom, Tom—what could the poor girl do? I assure you she has not wanted for my instigation to follow the dictates of her own heart and judgment in a matter which looks like one of life or death to her."

"I know you entertain but an indifferent opinion of my understanding and knowledge of life, ma'am," said Tom, with some pique; "but I am sure you cannot doubt the sincerity of my love for my sister."

"If I did so, sir, I should not now be thus parleying with you," replied the lady with severity.

"Well, dear ma'am," returned Tom insinuatingly, "you who love my own dear Fanny—that best, kindest, gentlest, sweetest of all sisters—so well, will you allow me one last experiment of a week's duration only! And, if it fail, I promise to give my consent to Captain Bethel's daughter becoming an artist's wife." The heroic air with which this was said, provoked a smile on the placid and benevolent features of Miss Whitstone, in spite of herself; and, before she could speak, Testy Tom exclaimed, "You laugh at me, as a foolish, raw schoolboy; but I don't mind that, so that you trust me this once."

"Laugh at you, Tom! no, surely—on the contrary, I am hand in glove with you; but may we learn the nature of your scheme, which I can have no doubt does equal honor to your fraternal affection, and Etonian acuteness!"

"You must not laugh at me, though," returned Thomas, his face mantling with the consciousness of possessing a delightful mystery—"I can bear you to laugh at me about anything in the world, save this." And he took a letter from his pocket-book. "You won't guess who this is from: my late aunt's heir, the Northern Bethel, as we have been used to call him. Ill as my uncle and the whole family have used him—neglected him like a poor relation, and hated him like an heir presumptive—he has behaved like an angel to my Uncle Bethel. He has been at Aix-la-Chapelle to visit him; and one of our gentlemen (viz., an Eton boy) informs me that it is understood he is to allow my uncle to enjoy a full half of my late aunt's revenue for the remainder of his life. My Uncle, you may be sure, was touched with this delicate generosity; for, beyond the term of her death, he was not, by law, entitled to draw one shilling. He has written me to be an attentive scholar, as he means to carry out the original plan of my education. But this letter"—and Tom struck it with his open fingers—"this is from that

fine fellow, young Bethel himself, inviting me to Bethel's Court, which my uncle has given up to him as a residence, and saying the kindest things to me and Fanny, whom he begs to call his 'cousins.' Now, the beauty—the very cream of it—is, that he has not written to the Rectory people at all."

Tom's eyes sparkled with gratified revenge. "So it won't be madam, my aunt, who can either obtain for me and my friends, or refuse us, a day's shooting at Bethel's Court, in a hurry again—or act as if all its gardens, hot-houses, and vineries, were more hers and her daughters', than poor Fanny's and mine."

Miss Whitstone, who had smiled all along, was now reading the letter, which she pronounced charming. "But, then, what has all this to do with delaying Mr. Edmund's answer a week, when the suspense is so hurtful to your sister's spirits, and so disrespectful to a person of whom we all have reason to think so highly as we do of Mr. Edmund?"

Tom suddenly recollected himself. "I shall tell you, only you, that, ma'am—for, wild dreamer as you may conclude me, I am sure you will not betray me; I wish Fanny to see Mr. Bethel, before she irrevocably pledge her fate. I am told he is a very well-looking man, and an accomplished, perfect gentleman; and you know, when a man comes to his property, he always thinks of marrying."

"At any rate, I am sure you will, Tom," said the smiling lady. "But what then?"

"What then! Dear ma'am, you are not wont to be so dull of apprehension:—if, which I think extremely likely, he should fancy our own Fanny!"

Miss Whitstone laughed heartily over Tom's basket of unhatched chickens; but looked in such good humor, that Tom durst not resent the liberty; and she atoned for all, by vowing that she knew not where the new inhabitant of Bethel's Court could find any wife half so charming or half so worthy of him. "And to have her, sweetest creature, so near me, too!" said the old lady, actually melting into delicious tears at Tom's hair-brained scheme. "But, poor Mr. Edmund!" she sighed, at last, but yet smiled as she looked to Tom. "Poh! never mind, my dear ma'am: I assure you we, lords of creation, are by no means so inconsolable upon such occasions as you ladies sometimes flatter yourselves. He shall get young Mrs. Bethel's picture to paint, at five hundred guineas: and, perhaps, if he wait ten years, my aunt, who admires him so much for Faany, will give him my cousin Harriet."

Tom permitted Miss Whitstone to tell his sister the conditions upon which his brotherly approbation was to be obtained to her marriage:—namely, if she did not prefer Mr. Bethel in one week, or failed to make a conquest of him in one month. Tom now stipulated that it should be a full month after that gentleman's arrival; but he was hourly expected. Even with this distorted prospect of a haven, Fanny rather improved in spirits; for there was no chance of any one falling in love with her—she was sure of that—and as for her fidelity!—

Tom did the best he could to cheer her, and get her into good looks and proper training, before the important first interview.

Next day, cards were issued, by Mrs. Dr. Bethel, to the relatives and such neighbors as she

deemed proper for Mr. Bethel's acquaintance, for a welcoming dinner at Bethel's Court, to be followed by a ball to the tenants and a few friends. Tom swelled with indignation in the knowledge that his aunt assumed to manage this entertainment—at the owner's expense, however—and, at once, to take Fanny's intended lover into her own dexterous hands. He vowed to circumvent her.

When the day of the entertainment came, Fanny was so nervous and distressed that there was no need to feign the headache which she pleaded as an excuse for absence in the note sent to her aunt, by whom her illness was very graciously lamented. Mrs. Dr. Bethel did not approve of distracting a young gentleman's affections by too many fair objects at the same time. He had his choice of Harriet, the stately and *stylish*, and Frances, the lively and pretty, with the different foils her maternal cares had collected in the neighborhood.

From the quarrel originating in the family mourning, Tom had not once crossed the threshold of the Rectory. He lived with a family in the vicinity of Bethel's Court, but beyond it in relation to Wincham, and only arrived in that town to see his sister receive those finishing touches in dress from Miss Collins' own hands, and those of the most fashionable friseur in the place, which he had bespoken; and to attend her to the grand scene of display.

What was Tom's horror—and, in spite of all his tenderness, his anger—to find his beauty of the night, languid, pale, exhausted, and bearing deep traces of suffering and recent tears! He scolded, he kissed, he coaxed in turns. Surely she would go with him to the ball! "It was not too late for that, though they might miss dinner. She might even lie down for an hour to refresh herself, and recover her looks. Their allies, the Taylors, and her particular correspondent and admirer, Mr. Richard, were come down, and would be so rejoiced to see her."

"I know all that," returned Fanny; "but with them came Mr. Edmund! Indeed, indeed, Tom—dear brother—you must not force me out to-night."

Tom looked aghast at her information, and muttered what sounded in her ears as curses of her lover. Spite of her gentleness, this was more than Fanny could endure. "I will not hear this!" she exclaimed passionately, and becoming deadly pale, as if about to faint; and Tom, overcome and alarmed, implored her forgiveness, and brought Miss Whitstone to mediate for him, and restore Fanny. Tom began to fancy that there might be, even among girls, affections too strong and deep to be fully understood by the wits of Eton. Fanny, who had never denied any request of Tom's in her whole life, however unreasonable in itself, was not slow to accord her forgiveness, deeply and indelibly as his conduct had wounded her heart; and no sooner was he pardoned than, like a true man, he returned to his original point: "Would she not confirm his pardon by granting his request—to appear with him when he was first presented to Mr. Bethel—whose good opinion and friendship might be so important to his future prospects?" Tom now pleaded on the score of prudence, and as if for the greatest personal favor; and Miss Whitstone at last joined him. "Indeed, my love, I think you might gratify Tom this once, since he has set his heart upon it—with so many old

friends to see too—and the new master of Bethel's Court might, I flatter myself, miss his young cousins."

"Cousins a hundred and fifty times removed," said Fanny, almost pettishly. But, with her natural sweetness, she added—"Since you rule it so, ma'am, I shall prepare." And as she rose, Tom kissed her over and over, and ran himself to the perfumer's fur as much rose-water to take away the redness about her eyes, as might have half-drowned her. His charges to Miss Collins and Patty, who were now both summoned by Tom as assistant dressers, were, "Now, don't let Miss Bethel make a dowdy of herself." And when the dressing was finished, though Patty declared that, in that clear muslin frock and white satin slip, she looked like an angel, Tom found her not half like enough to a "Fashion of the Month" to please him. Her gloves did not fit, and her slippers—far too large for her—were, indeed, what it would have made Tom mad to know, misfits of her cousin Fanny's, sent to her in economy. Then her ringlets drooped too long and hung too free. Fashionable girls wore their hair at present so—Tom could not name it, but he endeavored to imitate the thing he meant; and Miss Collins joined in opinion with him; while Patty cried—"Oh no! Those lovely flowing ringlets which Mr. Edmund thinks so charming a style for Miss Bethel!" Tom would not curse now; but it cost him an effort to be tranquil, while he inquired why Fanny did not wear her pearls with the ruby clasps—her mother's beautiful pearls, which had been preserved for her; and he requested her, at least on this gala night, to gratify him by using those ornaments. They were at the rectory. "Then, we shall call round till you get them—and your mother's beautiful Cachmere too—and then, if *our* Fanny—hey, Miss Whitstone!—cannot be so fashionable as Aunt Bethel's bedizened beauties, she shall be as expensively attired."

"Now, Tom, my dear boy, keep your temper," said the lady addressed. "I was almost as angry with Fanny's simplicity yesterday, as you could have been; and even more angry with the encroaching, selfish temper of my cousin, who chose to display the shawl to advantage on Harriet's fine figure, and contrast the strings of pearls with her own Fanny's dark tresses. Let us hope that the principal beaux to-night—those worth killing, I mean—believe, though the belief grows every day more rare, 'that loveliness needs not'—you all remember it. At least, my love, if the gentlemen of Bethel's Court don't admire you just as you are, be assured that Patty, and myself, and Mr. Edmund will—and Mr. Tom also."

"And that is all I care for," said the distracted Fanny, taking leave. "But how I wish this night were over, and I was back to you!—but don't you sit for me."

"Nay, I shall sit. You know, I am this night to give you, and Mr. Edmund, and friend Tom there, if he choose, and Mr. Richard Taylor, my very old friend, a *petit souper*, of sago and small negus, in my own chamber, in the style of the Old Court."

"Don't wait us, pray, ma'am," cried Tom, pulling his sister's arm within his own, tolerably well pleased, or reconciled to Fanny's dress, and fancying her ringlets not unbecoming after all, and tolerably confident that she must captivate Mr. Bethel if she would only set out. His kind encouragement, and thanks for exertion to oblige

him, and a drive in the quiet starlight, with Tom's arm around her, tended to tranquillize Fanny's spirits. "It is but a few more hours," she whispered to herself—"and then but a few days; and as soon as poor Tom, who does all these cruel things from the truest, though the most mistaken, love for me, learns to know Mr. Edmund, as he cannot fail soon to be known, we shall be so happy, with again a home, a fireside of our own—a happiness we have never known from infancy. I shall be so glad to see the Taylors, too, who were so kind to us in childhood." And she said aloud—"You remember the Brunswick Square Taylors, Tom, who were so kind to us when we came from India?"

"Well—and also who gave you that famous *Frau Jansen* which Harriet robbed you of, as she has to-night of your Cachmere. By Heavens! if I saw her hanging on Mr. Bethel's arm in that shawl, I would almost pluck it from her shoulders."

The carriage was now within the extensive grounds of Bethel's Court; and at every opening of the trees, or curve of the long winding approach, glimpses of the illuminated mansion were alternately caught, and again darkened in shadow or lost in total obscurity. Though the Allahbad Bethels had now resided for more than twelve years in this vicinity, neither of them had ever before seen the cheerful, life-giving sight of evening lights in their ancestral home. The house stood rather low, by the river, which made so fine a feature in the home landscape; and, as they passed through the thick obscurity of the neighboring groves, they found the old hereditary rooks startled from their nests, wheeling overhead, and cawing in terror. When the full sweep of the low, wide, blazing architectural front burst upon them, every object touched by the magic of light and shadow, Tom Bethel, in the high-wrought enthusiasm of the moment, pressed his sister more closely to his side, and exclaimed, "My own darling Fanny! could I but once see you the mistress of that house, I would give up every wish, surmount every care, for myself." And Tom was not more insincere than thousands of brothers and mothers have been before him, who, in pursuing their own half-selfish ambition, fancy they are making amazing sacrifices to promote the happiness of the being they torment.

The aristocracy of the party were leaving the drawing-room to proceed to the saloon—as the old stone hall had been new-named—to open the ball, as Tom Bethel's chaise drove up; and, amid the blaze of flambeaux without, and lamps within, he perceived, far off, his aunt, and his cousin Harriet, in the Cachmere, conducted by a gentleman, whom he rightly concluded the master of the mansion.

"They've hooked him already, by all that's sacred!" whispered Tom. "O, Fanny! why would you not come sooner? But, for any sake, now, don't be foolish—don't tremble so, you dear little fool." He lifted her out, and they entered the hall. Mr. Bethel and his ladies had paused in crossing, at the far end of the hall, to examine some of that rare quaint rich carving in wood, still to be found in a few ancient English mansions, and for which England was at one time so celebrated. His party, and those approaching them, were still separated by a short flight of marble steps, running across the hall; so that, while

Fanny and her brother were below, Mr. Bethel stood as it were upon a platform, or *dais*, with his back to those advancing. It was with difficulty that Tom, with his supporting arm round her waist, dragged his sister up these few steps; but, upon the last, she sunk on her knees, and leaned upon his shoulder; while, moved, as if by an instinctive feeling of her presence—for he could scarcely have seen her—Mr. Bethel disengaged himself from the arms of mother and daughter, and flew to Fanny's assistance.

"Very well, indeed!" said the younger lady, with a sneer. "If Fanny be late, she is determined to make a sensation when she does come." But Mrs. Bethel advanced to the group. Fanny had not fainted. She held the hands of her brother Tom and Mr. Edmund in her own, while her beautiful face, now richly suffused with rosy bloom, breathed the rapture of a spirit that first sees unfolded the gates of Paradise.

Though I had not seen Little Fanny Bethel for so many years—standing where she stood, and looking as she then looked, and knowing all I knew, I recognized her in the instant, and introduced myself. Then turning to Tom, after a friendly shake of his disengaged hand, I claimed the privilege, as a common acquaintance, of introducing Mr. Edmund Bethel to Mr. Thomas Bethel. All his Etonian self-possession could not sustain Tom at this instant. His face became of twenty colors, the burning crimson of shame predominating, and remaining fixed on his brow.

"Oh, what a fool I have been!—what a monster to my poor Fanny!—who, while she has fifty times my goodness, has a hundred times my sense." Mr. Bethel, without exactly hearing or caring to hear these words, shook hands most cordially with Tom, "his cousin"—to whom he "hoped soon to be more nearly allied," he whispered; and Fanny smiled like an angelic being.

"Fanny, my dear," said the advancing Mrs. Bethel, "what tempted you to brave the night air! I shall positively send you back with the carriage which has brought you—"

"Oh, do, dear ma'am," returned Fanny, who found this proposal the greatest possible relief in the present state of her feelings.

"Leave my niece to my management, Mr. Bethel," continued the bustling lady; "I shall chide cousin Whitstone well, I assure you, for letting her abroad. Come, Fanny, dear, I shall send Hopkins, my own maid, home with you."

"I will attend my sister home," cried Tom Bethel.

"I must be permitted that honor," cried Mr. Bethel. "My friendly guests, to whom I am quite a stranger—save, I dare say, that I have painted staring portraits of some of them—will gladly take Tom and Mr. Henry as my gay substitutes in their revel!"

Mrs. Bethel stared. "I would give up my claim for no man living, save Mr. Edmund Bethel," was my rejoinder.

Mrs. Bethel started! and looked from one to another. The truth flashed upon her mind. She had overshot the mark. Exquisite dissembler as she was, it was impossible altogether to conceal her feelings upon this singular turn of fortune. Tom Bethel gloated upon the passionate working and twitching of his aunt's features. He ran himself to inform Harriet, that Mr. Edmund, the painter, whose addresses to his sister had lately

been urged on by her mother, was none other than Mr. Edmund Bethel! Her stifled scream of surprise was music to him.

It was finally settled that Mr. Bethel and myself should attend Fanny to Wincham, while Tom and Henry Bethel, who were every way qualified, should do the honors of the rustic ball. I pretended a love of free air and star-gazing, and desired to sit without; and, though Fanny pleaded and protested that I would catch cold, I persisted—and I hope she forgave my obstinacy. She ran to Miss Whitstone—smiling, benevolent, happy Miss Whitstone—as we entered the house; and playfully chided her for having so mystified them, and allowed Tom to commit himself. “Poor Tom is still so young, poor fellow!” said she, stealing at Mr. Bethel one of her old childish looks of innocent fascination,—“and he loves me so truly!”

“And that affection might cover a multitude of sins, were they ten times worse than those of poor Tom,” returned Mr. Bethel. “Be assured, I forgive his no-offence to myself most sincerely. Indeed, Fanny, I grudged you to a poor painter as

much as Tom could himself have done, though that painter was myself!”

Nothing could be better said; and few explanations were required. Mr. Edmund Bethel had wished to spend a summer, near Bethel's court, and had found inducements to return another and another. It seems I had, among so many Bethels, introduced him as Mr. Edmund, and he kept by the half-name given him. The marriage took place in a month afterwards, to the entire satisfaction of all Wincham and Stockham-Magna—so universal a favorite was Fanny. It was, perhaps, the only marriage ever contracted under such flattering auspices; for even Mrs. Bethel was with the majority. She very properly said that, if she had consented while Fanny's lover was an obscure person, how rejoiced she must be now to find him one so different!

On the day of his sister's marriage, Tom obtained an appointment as midshipman in his Majesty's navy. He is now a lieutenant, and has lost, with much of his Latin and Greek, a great deal of his Etonian refinement and knowledge of the world.

THE HUSBAND'S COMPLAINT.

I HATE the name of German wool in all its colors bright;
Of chairs and stools in fancy-work I hate the very sight.

The shawls and alippers that I've seen—the ottomans and bags—
Sooner than wear a stitch on me, I'd walk the street in rags.

I've heard of wives too musical, too talkative, or quiet—

Of scolding or of gaming wives, and those too fond of riot;

But yet, of all the errors known which to the women fall,

For ever doing fancy-work I think exceeds them all.

The other day, when I came home, no dinner got for me;

I asked my wife the reason, and she answered,
“One, two, three!”

I told her I was hungry, and I stamped upon the floor;

She never even looked at me, but murmured,
“One green more.”

Of course she makes me angry, though she does n't care for that,

But chatters, while I talk to her, “One white, and then a black.

One green, and then a purple—(just hold your tongue, my dear;

You really do annoy me so)—I've made a wrong stitch here.”

And as for confidential chat, with her eternal *frame*,
Though I should speak of fifty things, she'd answer me the same.

Tiz, “Yes, love—five reds, then a black—(I quite agree with you)—

I've done this wrong—seven, eight, nine, ten—an orange, then a blue.”

If any lady comes to tea, her bag is first surveyed;
And, if the pattern pleases her, a copy then is made.

She stares the men quite out of face; and when I ask her why!

'Tis, “O! my love, the pattern of his waistcoat struck my eye.”

And if to walk I am inclined ('tis seldom I go out,) At every worsted-shop she sees, oh! how she looks about,

And says, “Bless me! I must go in—the pattern is so rare;

That group of flowers is just the thing I wanted for my chair.”

Besides, the things she makes are all such touch-me-not affairs,

I dare not even use a stool nor screen: and, as for chairs,

'T was only yesterday I put my youngest boy in one,

And until then I never knew my wife had such a tongue.

Alas! for my poor little ones, they dare not move or speak;

'T is “Tom, be still; put down that bag. Why, Harriet, where's your feet?

Maria! standing on that stool! it was not made for use;—

Be silent all. Three greens, one red, a blue, and then a puce.”

Oh! Heaven preserve me from a wife with fancy-work run wild,

And hands which never do aught else for husband or for child.

Our clothes are rent, our bills unpaid, our house is in disorder:

And all because my lady-wife has taken to embroidery.

I'll put my children out to school—I'll go across the sea;

My wife so full of fancy-work, I'm sure cannot miss me.

E'en while I write she still keeps on her “One, two, three, and four.”

She's past all hope. Those Berlin wools, I'll not endure them more! *Britannia.*

From Chambers' Journal.

It is nine years since we addressed our readers in a formal manner about ourselves. Will they have patience with an egotism which observes such a long silence? We presume they will, and shall therefore proceed to say a few words about our position and prospects.

The Journal is now entering upon its fourteenth year. We begin to get letters from lady subscribers, who tell us they commenced reading it when they were little girls, and now have two babies rapidly rising to strike in as readers too. In fact, it is becoming a somewhat venerable publication. Well, we trust it is not the worse for that, but somewhat the better. We are at least assured that its acceptance with the public is not less than it ever was, for its sale—raised one-half by the change of size—is not much under ninety thousand copies. The most popular magazines circulate, we believe, from six to nine thousand; but the sale of the Journal in its magazine shape alone (the monthly part being strictly a magazine) is about forty thousand. During the currency of this work, we have brought out several others: a series of books designed to aid in the realization of an improved education;* a kind of encyclopædia for the middle and working-classes;† a history of English literature, chiefly intended to introduce the young to the Pantheon of our national authors.‡ And all of these works have met with success hardly less marked than that of the Journal. Indeed, that of the Information for the People has been considerably more, for the average sale of the numbers of that publication has been about a hundred and thirty thousand—a fact, we believe, unprecedented in the same department of literature. More recently we have commenced another work, a series of tracts designed for the instruction and entertainment of a still humbler class of readers; § and already it would appear as if the ordinary sale of this work is to be greatly beyond that of any other, the impressions required of the first few numbers (all yet prepared) having been in no case less than a hundred and fifty thousand, and in some instances nearly two hundred thousand, copies. Verily, it must be admitted, there is here a vast diffusion of literature, of whatever kind it may be. Or may we not rather say that these things mark an entirely new era in literature, something which throws all the former efforts of the press into the shade?

Let us just look for a moment into the details of this phenomenon. We write at present in a huge building of four stories, flanked by a powerful steam-engine, and with the noise of ten printing machines continually sounding in our ears. Several of these are engaged in working off impressions, the production of which at a common hand-press, such as formed the sole means of typography a few years ago, would have required nearly the time then requisite for a voyage to India and back. A hundred and twenty persons are required for all the duties which proceed in this large structure, though these have exclusively a regard to works edited by ourselves. Upwards of a quarter of a million of printed sheets leave the house each week, being as many as the whole newspaper

press of Scotland issued in a month about the year 1833. Our publications, which at first were expected by the booksellers to be the ruin of their business, do not yield them less than fifteen thousand pounds a-year of profit; while yet the number of ordinary books published each year, instead of being diminished, is considerably increased. These are some of the material details; but who shall say what are the particulars of the moral results of this enormous contagion of paper and print! We willingly allow each man to judge from what he observes in his own familiar circle. We have, for our part, a general and all-sufficient faith.

Friends to whom we chance to mention some of these matters, often say to us, "What a power for good or evil you possess!" There could not be a greater mistake. It is not a power for evil at all. This has been tried, and fully proved, by other editors. Similar works without number have been presented to the public, but, because they pandered to the meaner feelings of our nature, they invariably failed. We have ever felt, that, whatever might be our own inclinations, we must aim at the pure, the elevating, and good, if we would wish our publications to acquire any permanent hold of the public mind. It is a common notion, we believe, among the clever fellows, that the public is to be gulled, tickled, addressed as a child, and that, the lower the tone assumed, they will be the more pleased. Our experience says quite the reverse. We have, and always have had, an unfeigned respect for both the intellectual and moral character of the public. We sincerely believe that the higher sentiments rule its general procedure, and that the grosser souls are in all ordinary circumstances powerless. We therefore never doubted that, in earnestly seeking to give good counsel and innocent entertainment, we were taking the course which common prudence would have dictated, all the sophistications of all the Jenkinsons notwithstanding; and it is thus that we feel assured of our publications being attended with good effects upon the community. They only have a large sale because they address and meet responses in the better feelings of the mass of our countrymen.

When the publications of Mr. Knight and others are taken into account, it will be seen that the amount of literature now diffused among the people must be something very different from what it was a few years ago. On a moderate calculation, we cannot doubt that our own publications are fully doubled by the other works of a respectable kind now issued weekly; that is to say, there are not fewer than half a million of cheap sheets published every week. Add to these the very considerable number of cheap book-publications, copyright and otherwise, and it must be apparent that there is a moral agency at work in this country such as has never been formerly known, except in the most feeble form. Is it not now, indeed, for the first time, that the powers of the printing-press have been turned to their right account! And yet, after all, it is highly questionable if anything like full advantage has been taken of the powers of this marvellous engine. There is no default in its own mechanism, but the mechanism for the diffusion of its productions is still far from being what is desirable. The system of bookselling in this country has not undergone an improvement at all comparable to that which we have seen in the paper-making and typographical departments. No fault is it in the members of that excellent frater-

* Educational Course—37 volumes published.

§ Miscellany of Useful and Entertaining Tracts, appearing in weekly numbers at a penny and halfpenny each.

nity. But books such as we refer to ought to be sold by many others besides ordinary booksellers. Why should it be that tea, tobacco, and even less approvable articles demanded by the people, should be purchasable in the smallest quantities in every village in the empire, and not that literature which has become, in one form or another, almost as much a necessary of life as any? Surely, in many of the little establishments where the needs and cravings of the frail body are supplied, those of the immortal spirit might also be gratified; and that without necessarily diminishing the trade of the ordinary booksellers! One fact will illustrate this. In a little village, where at one time none of our publications were sold, a philanthropic gentleman induced a female dealer in small wares to commence selling the 'Traots.' She quickly found regular customers for forty copies. Here were forty copies sold where formerly the work was unheard of; and we cannot doubt that thousands of places are in the like predicament. There most certainly be some improvement in the book-selling system of the country; we must have this kind of wares presented in many quarters where it formerly was unthought of, ere we can say that the system of cheap publication is complete, or has "gathered all its fame." A benevolent friend has suggested that persons verging upon pauperism might often help themselves in some degree to a livelihood, if individuals taking a kindly interest in them were to furnish them with a first stock of such wares. We have had the plan tried in several instances, and have found it effectual.* Perhaps by such means, in addition to all others, the extreme limits of the diffusibility of popular literature might in time be reached.

When this point is attained, and great effects begin to become apparent to those who watch the signs of nations, it is not unlikely that the humble services of the individuals now addressing the public will be remembered and inquired into. It will perhaps be recollected that Chambers' Journal was the first periodical work which aimed at giving respectable literature at a price which made it accessible to every class of persons really desirous of reading, and that in that and several other publications, without the slightest extraneous support, its editors arrived at and maintained for several years an extraordinary degree of success. May it not then be asked, what was the cause of this success! To what are we to attribute the existence of that vast ten-machine printing-house! Will it be worth while to listen for a moment to the impressions which were entertained on that subject by ourselves? Presuming that there may be some curiosity on such a point, we will here mention that we attribute it not to any peculiar literary talent; we attribute it not to any extraordinary intellectual gifts; neither do we think fortune had anything whatever to do with it. It arose solely from the view we took of the duties resting upon those who make a profession of the

pen. We felt, in the first place, that foresight, punctuality, and other homely and prudential virtues, were necessary even for the purpose of enabling us to possess our minds in peace—that peace without which no studious life can be conducted to any good results. And it was but a corollary from that view, that we should have a publishing system under our own command, as by no other means could the requisite unity of movement and procedure have been attained. On this point we would observe incidentally, that we trust yet to make out a problem of no small consequence to men of letters—that is to say, we trust to establish, that to employ a printing and bookselling system to work out his purposes, is a much more eligible position for the literary laborer, than to come with all his powers of thought, and the aspirations attending them, and subordinate these to a man of trade. We think it will be found that the first position, which is ours, is that by far the best fitted to secure independence of action, and even that elevation of mind which is supposed to rest apart from trade, as well as exemption from those degrading cares which are so hostile to the exercise of the higher faculties, and have been the shipwreck of so many votaries of letters. We further felt that the tasks assumed by us were of a very different character from what their external features indicated to the shallower class of minds. Even to speak of materialities alone, the aggregate vastness of a cheap publication was calculated to impress a strong sense of the importance of such a work. What came before the eyes of individuals as a single sheet at an infinitesimal price, presented itself to our sense in colossal piles of paper and print, and large commercial transactions. At the fountain-head, its respectability, in the common sense of the word, could not be matter of doubt, whatever it might in the remote rills of diffusion. But, remarking the great apptency of the middle and humbler classes for the reading of such works, it was impossible not to advance to far higher considerations, and see, in the establishment of such a miscellany as the Journal, the attainment of a predicatorial position hardly paralleled in the country. It fully appeared that such a work, if conducted in a right spirit, might enable its editors weekly to address an audience of unexampled numbers. We felt that by this means a vast amount of unequivocal good might be effected amongst the humbler classes in particular. Coming before them with no stamp of authority to raise prejudices, but as the undoubted friend of all, it could convey counsel and instruction where more august missionaries might fail. Gaining the heart of the poor man, always inclined to jealousy, it might, by dint of its absolute transparent well-meaning, force reproofs and maxims upon him which he would take from no other hand. By such a work the young might be, even in the receipt of amusement, actuated to industrious and honorable courses. Everywhere, by presenting entertainment of a pure nature, and of superior attractiveness, that which was reprehensible might be superseded. Nor might it be impossible, even in so small a work, to present papers of an original kind in the departments of fancy and humor, as well as of observation and reflection, such as might be expected to cultivate the higher powers of the popular intellect.

While, then, many superficial persons scoffed at the course we had entered upon, we saw in it

* A mendicant, applying for alms at our office in Glasgow, was furnished with two copies of a tract, that he might endeavor to sell them in the streets, and thus make money by a more legitimate mode. He disposed of them in ten minutes, and came back with the money to purchase more. Having sold these also, he returned for a new supply, and, in short, his transactions in four hours reached six shillings, leaving himself a clear gain of one and sixpence. He was to have come back to renew his efforts next morning; but, unfortunately, from whatever cause, he never reappeared.

the means of a large usefulness, and gave ourselves to it with cordial good-will. Determining first upon a few leading principles—particularly that political and theological controversy should never receive a moment's attention; animated by sincere and earnest wishes to promote whatever was clearly calculated to be beneficial to our fellow-creatures in the mass; despising all trivial and petty objects, and aiming ever to confer a dignity upon our own pursuits—we advanced in our course, and persevered in it year after year; never once doubting that the issue would justify and illustrate our first resolutions. The result, we may surely say, is to some extent determined, and that in a manner favorable to the soundness of our views; for how otherwise could it be that (to look no higher for proof) there is at this time no literary system in the country which approaches ours in magnitude? How else should it be that, while all other literary operations are conducted with more or less jarring between associated interests, and while most have to resort to extraneous expedients for success, we scatter the matter of hundreds of thousands of volumes annually over the land, without experiencing the slightest disturbance from sordid details, or ever having to look a moment beyond the intrinsic value of the article itself for a means of arresting public attention.

We would, in conclusion, express our humble trust that the ordinary readers of the Journal can be under no risk of misunderstanding the nature of these remarks. We have spoken in the language of earnestness and of truth, on a subject on which we are conscious of entertaining other besides feelings of self-love, and where public interests are, we think, as much concerned as our own. This kind of language usually meets with sympathy, and we humbly hope that on the present occasion there will be no exception from the rule.

ONLY ONE MURDER.

[We find the following in the "Christian Witness," but do not know from what work it is taken. Let us all, while we see how clearly the poor Greenlander was wrong in wishing to indulge himself *only this once*, look at our own hearts, which are as disobedient, though our minds are more enlightened.]

It has ever been a fixed law in Greenland, that murder, and particularly the murder of a father, must be avenged. About twenty years before the arrival of Saabye, a father had been murdered in the presence of his son, a lad of thirteen, in a most atrocious manner. The boy was not able then to avenge the crime, but the murderer was not forgotten. He left that part of the country, and kept the flame burning in his bosom twenty-five years, no suitable opportunity offering for revenge, as the man was high in influence, and many near to defend him. At length his plan was laid, and with some of his relations to assist him, he returned to the province of the murderer, who lived near the house of the Saabye; there being no house unoccupied, where they might remain, but one owned by Saabye, they requested it, and it was granted, without any remark, although he knew the object of their coming.

The son soon became interested in the kind missionary, and often visited his cabin, giving as his reason, "you are so amiable, I cannot keep away from you." Two or three weeks after, he requested to know more of "the great Lord of heaven," of whom Saabye had spoken. His request was cheerfully granted. Soon it appeared that himself, and all his relations were desirous of instruction, and, ere long, the son requested baptism. To this request the missionary answered, "Kunnuk, you know God: you know that he is good, that he loves you, and desires to make you happy; but he desires also that you shall obey him."

Kunnuk answered, "I love him, I will obey him."

"His command is, 'Thou shalt not murder.' " The poor Greenlander was much affected and silent. "I know," said the missionary, "why you have come here with your relations; but this you must not do, if you wish to become a believer."

Agitated, he answered, "but he murdered my father."

For a long time the missionary pressed this point, the poor awakened heathen promising to "kill *only one*." But this was not enough. "Thou shalt do no murder," Saabye insisted was the command of the great Lord of heaven. He exhorted him to leave the murderer in the hand of God to be punished in another world; but this was waiting too long for revenge. The missionary refused him baptism, without obedience to the command. He retired to consult his friends. They urged him to revenge.

Saabye visited him, and without referring to the subject, read those portions of scripture and hymns teaching a quiet and forgiving temper. Some days after, Kunnuk came again to the cabin of the Saabye. "I will," said he, "and I will not; I hear and I do not hear. I never felt so before; I will forgive him, and I will not forgive him. The missionary told him, when he *would* forgive, then his better spirit spoke; when he *would not* forgive, then his unconverted heart spoke." He then repeated to him the latter part of the life of Jesus, and his prayer for his murderers. A tear stood in his eye. "But he was better than me," said Kunnuk. "But God will give us strength," Saabye answered. He then read the martyrdom of Stephen, and his dying prayer for his enemies. Kunnuk dried his eyes and said, "The wicked men! He is happy; he is certainly with God in heaven. My heart is so moved, but give me a little time; when I have brought the other heart to silence, I will come again." He soon returned with a joyful countenance, saying, "Now I am happy; I hate no more; I have forgiven; my wicked heart shall be silent." He and his wife, having made a clear profession of faith in Christ, were baptized and received into the church. Soon after, he sent the following note to the murderer of his father: "I am now a believer, and you have nothing to fear," and invited him to his house. The man came, and invited Kunnuk, in turn, to visit him. Contrary to the advice of his friends, Kunnuk went, and as he was returning home, he found a hole had been cut in his boat in order that he might be drowned. Kunnuk stepped out of the water, saying, "He is still afraid, though I will not harm him!"

THE POET BEFORE AND AFTER DEATH.

"I beg you to use your utmost interest, and that of all your friends, to move our Commissioners of Excise to grant me my full salary. If they do not grant it, I must let my account with an exit truly *en poete*—if I die not of disease, I shall perish with hunger. "ROBERT BURNS."

Thus, in the prime of manhood, dies
The man with the large heart and eyes
That flashed and echoed to the skies
In passion's storm—
A friendless gauger of Dumfries—
Crushed like a worm.

Four helpless children midst the gloom
Wander and weep from room to room ;
Their mother striving with her doom
As mothers strive,
Who feel that o'er the closing tomb
There will be five.

Since then the bard's volcanic breast
Has had its half-a-century's rest ;
But still the "Mouse's" humble nest,
Rudely o'erthrown,
And "mountain-daisy's" fate suggest
The poet's own :

Soon contrite Scotland, to reward
Her crushed and broken-hearted bard,
With costly "Mausoleum" marred,
The image traced
Upon his dedication card
So truly chaste ;

And moving thence his mouldering bones
(As if dead bees were dear to drones,)
Before the graceless heap of stones
Upon his dust,
She spake in exultation's tones
Of being just.

Justice, in spite of bandaged eyes,
Has still a heart to sympathize
With the susceptible and wise
By her own scales,
So often doomed to fraternize
In county jails.

What but this knowledge could induce
The *lamb* to bear the flag of truce
As though it sanctioned the abuse
Which still denies

Justice, in woman's shape, the use
Of her own eyes.

Though Scotland long had set her face
With smiles for Burns and all his race,
At length, to wipe out her disgrace,
If such might be,
She danced around his native place
In jubilee !

From the Louisville Journal.

THE GOLDEN RINGLET.

HERE is a little golden tress
Of soft unbraided hair,
The all that's left of loveliness
That once was thought so fair ;
And yet, though time has dimm'd its sheen,
Though all beside hath fled,
I hold it here, a link between
My spirit and the dead.

Yes, from this shining ringlet still
A mournful memory springs,
That melts my heart, and sends a thrill
Through all its trembling strings.
I think of her, the loved, the wept,
Upon whose forehead fair,
For eighteen years, like sunshine, slept,
This golden curl of hair.

Oh, sunny tress ! the joyous brow,
Where thou didst lightly wave
With all thy sister tresses, now
Lies cold within the grave.
That cheek is of its bloom bereft ;
That eye no more is gay :
Of all her beauties thou art left
A solitary ray.

Four years have passed, this very June,
Since last we fondly met—
Four years ! and yet it seems too soon
To let the heart forget—
Too soon to let that lovely face
From our sad thoughts depart,
And to another give the place
She held within the heart.

Her memory still within my mind
Retains its sweetest power :
It is the perfume left behind,
To whisper of the flower.

Each blossom, that in moments gone
Bound up this sunny curl,
Recalls the form, the look, the tone
Of that enchanting girl.

Her step was like an April rain
O'er beds of violets flung;
Her voice the prelude to a strain,
Before the song is sung:
Her life, 't was like a half-blown flower,
Closed ere the shades of even;
Her death the dawn, the blushing hour
That opes the gates of heaven.

A single tress! how slight a thing
To sway such magic art,
And bid each soft remembrance spring
Like blossoms in the heart!
It leads me back to days of old—
To her I loved so long,
Whose locks outshone pellucid gold,
Whose lips o'erflowed with song.

Since then I've heard a thousand lays
From lips as sweet as hers;
Yet when I strove to give them praise,
I only gave them tears.
I could not bear, amid the throng
Where jest and laughter rung,
To hear another sing the song
That trembled on her tongue.

A single shining tress of hair
To bid such memories start!
But tears are on its lustre—there
I lay it on my heart.
Oh! when in death's cold arms I sink,
Who, then, with gentle care,
Will keep for me a dark brown link—
A ringlet of my hair! AMELIA.

From the True Sun.

TO ———

Of thy love it shall be said,
That its sweetest spell was laid
On my heart in trouble;
When the roses in my way
Faded fastest day by day,
And the thorns grew double.

Though with accents faint and weak,
Thou the binding-vow didst speak,
Trembling at the altar;
Yet whene'er that binding vow—
Led through tribulation, thou
Never yet didst falter.

And when brighter days were mine,
With my hand enclosed in thine,
Each on the other leaning;
We through many a sunny hour,
In each bursting bud and flower,
Found a mystic meaning—

Typical of many things,
While imagination's wings,
Lovingly upbore us;
And we painted sunny skies,
Looking in each other's eyes,
For the life before us.

Like a guardian angel thou,
When the cloud is on my brow,

In the hours of sadness—
Bidst the airy phantoms fly,
While beneath thy loving eye,
Grief is turned to gladness. B. H.

BOOKS RECEIVED.

THE POPULAR LECTURES ON SCIENCE AND ART, which have been delivered in the chief cities and towns in the United States by Dr. LARDNER, are announced for publication in numbers by Messrs. Greeley and McElrath, New York. They are to be copiously illustrated with engravings on wood. Ten or twelve numbers, at 25 cents each, will complete the course.

This work will be a public good, and from the preëminent ability of the lecturer in the *manner* of communicating knowledge—combining “simplicity of language, perspicuity of reasoning and felicity of illustration”—will no doubt have a very extensive sale.

Messrs. Harper and Brothers have sent us,—

POEMS BY FITZ-GREENE HALLECK. This volume is handsomely printed, and illustrated by a moonlight view of Alnwick Castle. Would that Mr. Halleck had made the volume larger! He has collected the poems upon which he expects the award of posterity to be founded.

ILLUSTRATED SHAKESPEARE, 45, 46. This completes *Much Ado about Nothing*.

COPLAND'S DICTIONARY OF PRACTICAL MEDICINE, edited by Dr. C. A. Lee. Part V., running from *Delirium to Dropsy*. 50 cents.

THE IMPROVISATORE. Translated by Mary Howitt, from the Danish of Andersen. 12½ cents.

THE ANCIENT REGIME. By G. P. R. James. 2 vols. in 1. The sixth volume of Pocket Edition of *Select Novels*. 25 cents.

TWICE TOLD TALES. By Nathaniel Hawthorne. 2 vols. 12mo. Well printed by *James Munroe & Co.*, Boston.

This book, though in prose, was written by a poet. A calm, thoughtful face seems to be looking at you from every page. One of the most prominent characteristics of these tales is, that they are national in their character. The author has wisely chosen his themes among the traditions of New England. Another characteristic of this writer is the exceeding beauty of his style. It is as clear as running waters are. Indeed, he uses words as mere stepping-stones, upon which, with a free and youthful bound, his spirit crosses and recrosses the bright and rushing stream of thought.—In speaking in terms of such high praise as we have done, we have given utterance not alone to our own feelings, but we trust to those of all gentle readers of the *Twice Told Tales*. Like children we say, “Tell us more.”

North American Review.

HOME. By Miss Sedgwick. The name of the author of *Redwood* and *Hope Leslie* is a sufficient commendation of this work to our readers—and we perceive that this is the *fifteenth* edition. Published by *James Munroe & Co.*

THE LOVER'S FORTUNE. Translated from the German. *James Munroe & Co.* Of this neat volume we shall say nothing, for we know no more; and besides, we perceive that it is not just published.

From *Fraser's Magazine*.

BUNYAN AND BUNHILL FIELDS.

HOWEVER much people may affect to question the right of Mr. Southey to the name of a great poet—and critics speak confidently both for and against him—no one will affect to dispute his claim to be considered one of the very best of our English prose writers. Nor is it too much to say, perhaps, that his least merit is his style. His range of reading was wide, his diligence great, his memory still greater. He knew the world by something more than the mere spectacles of books; he had looked on nature for himself, and had compared his own experiences with the experiences of others. His observations on life are almost always to the point, and his opinions of men and books invariably of value. He had many of the inborn and acquired qualifications of a good biographer. He could suck the marrow of a book, and give you in a *Quarterly Review* article the cream of what Coxe had scattered, with an uncunning skill, over two thick quarto volumes. But he always wanted a good pioneer to go before him; and, though he affected at times to despise the poor but faithful antiquary, with his corn and chaff inconsiderately got together into one unmeaning heap, he was willing to admit the great utility of the pioneer species of literary men, and the important services which men like Rymer and Oldys, or Carte and Coxe, had conferred upon English history. He was, what is more, a pioneer himself, as much as his leisure time or the resources of his own library would well permit him. His *Life of Cowper* exhibits a keen and patient examination of the dead or dormant literature of the last century, and an anxiety to detect any little particle of information likely to throw light on the subject of his memoir.

He was very well aware of the charm with which new materials invariably invest a new biography; of the importance of a date, either in establishing a circumstance beyond cavil or dispute, or in rejecting it altogether from the pale of authentic matter. His diligence was unceasing. He always read with an object, and with a view to a variety of different publications. But his library, though large for a private individual, and large, moreover, for his means, was very ill suited for the wide and diversified range of his writings. Nor was there a library amid the lakes and wilds of Cumberland likely to be of any use to him. He wrote, therefore, under very heavy disadvantages; and it has always appeared to us, that his continuation of Warton's invaluable history, over which he brooded for so many years, must necessarily have been, had it ever been executed, a most imperfect publication. The reading and research of Warton were not confined to the college libraries of Oxford, or the glorious treasures of the Bodleian; he had availed himself of the treasures at Winchester and Cambridge, and had carried his researches into the then newly established British Museum. But we are not likely soon to see another Tom Warton among us; perhaps we shall never see another Southey. They were both great men. The unfinished history by Warton is a monument of human industry and learning; and the prose works of Southey master-pieces of English composition.

Southey thought his best prose work his *History of Brazil*; nor are we inclined to dispute his preference. The manner is above all praise, and the matter, considering its want of European attraction, highly entertaining. He thought comparatively

little of his *Life of Nelson*; nor is his a solitary case of an author differing in his estimate of the value of his own writings from the standard measure of public opinion. The *Nelson* is a delightful narrative, within the compass of a pocket volume, of the heroic life and the heroic end of the greatest admiral of all time—the most English of all English heroes. But it is far from a satisfactory life in the minuteness of its information; and men who test and try all biographies by the standard of their favorite Boswell—and we know very many who do this—will find it wanting in the scale of excellence by which they weigh and measure a biography. Southey's *Life of Nelson* will live as long as the English language, and will always form an enduring introduction to the *Nelson Despatches*, now in course of publication under the watchful eye of Sir Harris Nicolas.

Mr. Southey was an author by profession; he lived (his pension excepted) entirely by his pen. He was too apt, therefore, to measure out his articles and biographies by the sheet. He was, moreover, a writer too apt to diverge into other speculations, from the width and variety of his reading. His *Life of Wesley* is too big a book for the importance of Wesley. His *Life of Cowper* is written on too extended a scale for the little variety of incident or circumstances in the recluse-like life of the Olney hermit; his *Life of Kirke White* is more in the nature of a preface; his *Life of Isaac Watts* too hurried a performance to be criticised by the Southey standard of excellence in prose; while his *Life of Bunyan* abounds in all the beauties of his style, and all the defects of his library and reading.

The best biographies in the world are the inimitable *Lives* of the inimitable Plutarch. They are models in this style, in manner, treatment, and length. We have good biographies of our own. The *Lives of the Poets*, by Dr. Johnson, is one of the most fascinating books in the whole range of English literature. We are at a loss to decide which of the several *Lives* we should admire the most. Cowley was the doctor's own favorite, not for the method or excellence of its narrative, but from the clear and concise account it contains of the rise and fall of the so-called metaphysical poets among us. The Dryden is a delightful *Life*, but there is hardly a date that is correct throughout the whole of its pages. Pope we read in spite of Mr. Roscoe, nor will it be easy, or even possible, to push it out of favor. The *Life of Savage* was an early composition, and the reader may observe thirty years' difference of style between it and the Dryden. *Savage* extends over some one hundred and fifty pages; and of the three or four dates throughout the whole biography, and it actually contains no more, two, at least, are seriously incorrect. The date of his birth is grossly erroneous, and the year of his death was wanting in the first edition. When we have mentioned these curious circumstances in the *Life of Savage* in the hearing of people well acquainted with the minute circumstances of the narrative, we have found them unwilling to believe us. The truth is, the matter is so romantic, and the manner so irresistible, that people read it, as Reynolds read it, at a *standing*, and in the avidity of their reading forget everything about dates, those necessary landmarks in history of every kind.

It is fitting to observe here how our best wri-

ters—such as Hume, Johnson, Southey, and others—have too often been careless in their facts, and how our worst writers in point of style have been painfully minute in their pins' heads of particulars. The lives, by Strype, of the various churchmen in the time of Queen Elizabeth; the biographies of Dr. Birch; and the *Life of Dryden* by Malone, are so many storehouses of minute and even extraneous information. The student of English history—we use the word in its wide sense—will seldom quit their pages without finding what he seeks, and without carrying away much curious matter, foreign, it is true, from his subject, but still important. The rare art is to combine the two great qualities of research and style. A Strype and Southey combined would make a perfect biographer, and a life by their united exertions a complete biography.

No country is richer in worthies than Great Britain, or richer in materials for the proper compilation of their Lives. But these materials lie scattered over so many volumes—some small and scarce, and consequently dear, others large and expensive. The student of English history is perpetually at a loss for a good *Biographia Britannica*. He feels a difficulty at every turn, and wanders out of his way in search of information which one good work should supply to his hand at once. We have, it is true, several sets of Lives. Johnson wrote the *Lives of the Poets* from Cowley to Gray; Campbell the *Lives of the British Admirals*; Macdriarmid the *Lives of the British Statesmen*; Allen Cunningham, the *Lives of the British Artists*; and Sir Walter Scott, the *Lives of the British Novelists*. All possess a variety of merits, and some of the shorter Lives are good specimens of matter and manner. But the *Biographia Britannica*, though a century old, is still our great storehouse of facts; nor is it likely, from what we hear, to be soon supplanted. This we regret, because the Lives of British Worthies should be a British undertaking—one that would prove, when properly performed, a far nobler monument to their memories than the statues in bronze about the squares of London, or the statues in marble that choke Westminster Abbey, or stand half seen within St. Paul's.

We have been led into these remarks from a perusal of Mr. Southey's "Life of Bunyan," in Mr. Murray's *Colonial Library*; and from the recent publication of a new Life of the fine old Baptist dreamer by Mr. George Godwin, before Mr. Selous' illustrated edition of the *Pilgrim's Progress*. Mr. Southey exhausted the stores of his own shelves and the supply of books which his publisher had sent him in the composition of his biography. Mr. Godwin exhibits a spirit of patient investigation, and the recent annotator of *Southey's Life* a love of reference and research, which merit imitation. But the *Life of Bunyan*, though inimitably well written by Mr. Southey, and succinctly compiled by Mr. Godwin, has yet to be written, not at greater length, we must allow, but with the new materials which fresh investigation cannot fail to produce; and, in the hope that some pains-taking inquirer will go into the subject forthwith, we here contribute a new and important fact in the consideration of Bunyan's life to the future biographer of this "Spenser of the people."

No kind of religion was safe under Charles II. Persecution prevailed at one time, and toleration at another. The king was careless and indiffer-

ent; perhaps he was a Deist; he died a Roman Catholic. The duke, his brother, was an uncompromising Papist. The king disliked the Presbyterians; the ill-bred familiarity of the Scotch divines had given him a distaste for that part of the Protestant religion. The church for which his father lost his head was as little to his liking; sectaries of all kinds he viewed with fear and disgust. His licentious course of life led him to repose at last on the bosom of a forgiving and infallible church, and the easy nature of his temperament to enforce an Act of Uniformity at one time, and a Declaration of Indulgence at another. Barrow and South were as little to his taste and inclination as Calamy and Baxter. He would not trust sufficiently to his own sense of what was just and proper, but threw himself into the hands of others, who used him as a means to their own evil ends, or their own personal aggrandizement. This was his father's fault; but the father did think, and then allowed himself to be overruled: while the son was ruled, to save himself the trouble of thinking at all.

Raleigh wrote his *History of the World* in the prison of the Tower; Wither, his *Shepherds Hunting* within the walls of the Marshalsea; Lovelace, his little poem on the *Freedom of the Mind* within the Westminster Gate House; and Bunyan, his glorious dream of the *Pilgrim's Progress* in the gaol at Bedford. Raleigh perished on the block; and Lovelace in a Shoe Lane lodging, surrounded, it is said, by want. Wither was afterwards an inmate of Newgate and the Tower; but Bunyan had a happier end. State matters were of very little moment to honest John Bunyan; and, so long as he was allowed to preach the Lord openly and honestly, his happiness was at its height; and this he was allowed to do unmolested from the period of his enlargement till his death. The fruit of his imprisonment is before the world; the true history of his release has yet to be related.

The toleration promised by the king at Breda was wholly overlooked in the act of uniformity; and Bunyan was one of the first persons after the restoration, who was punished for disobedience of the law. He was unwilling to desist from preaching the word of God, and was imprisoned for his preaching. Twelve long years was Bunyan an inmate of Bedford gaol; and he at length owed his release to accident, and to his old enemies the Quakers. After the fatal fight at Worcester, the king made his way, it is well known, through dangers and difficulties, to the sea-side at Shoreham, from whence he effected his escape, by a small fishing-vessel, to the coast of France. The master and mate of this little vessel were Quakers, as we gather from the following interesting letter, hitherto unpublished, from Ellis Hookes to the wife of Fox, the founder of the sect of Quakers. The original letter is preserved among the Quaker records at Devonshire House in Bishopsgate Street:—

"For Thomas Greene, shopkeeper in Lancaster.
"For M. F.

[January, 1669-70.]

"Yesterday there was a friend with the king, one that is John Grove's mate. He was the man that was mate to the master of the fisher-boat that carried the king away when he went from Worcester fight, and only this friend and the master knew of it in the ship, and the friend carried him (the king) ashore on his shoulders. The king

knew him again and was very friendly to him, and told him he remembered him, and of several things that were done in the ship at the same time. The friend told him the reason why he did not come all this while was that he was satisfied in that he had peace and satisfaction in himself, and that he did what he did to relieve a man in distress, and now he desired nothing of him but that he would set friends at liberty who were great sufferers, and told the king he had with him a paper of 110 that were præmunired, that had lain in prison about six years, and none can release them but him. So the king took the paper and said, that there were many of them, and that they would be in again in a month's time, and that the country gentlemen complained to him that they were troubled with the Quakers. So he said he would release him six. But the friend thinks to go to him again, for he had not fully relieved himself."

This highly interesting letter is endorsed by Fox himself, "*E. Hookes to M. F., of passages concerning Richard Carver that carried the king of his back. 1669.*"

Hookes' next letter among the Quaker papers is addressed to Fox, the founder of the sect:—

"[February, 1669-70.]

"Dear G. F.—As for the friend that was with the king, his love is to thee. He has been with the king lately, and Thomas Moore was with him, and the king was very loving to them. He had a fair and free opportunity to open his mind to the king, and the king has promised to do for him, but willed him to wait a month or two longer. I rest thy faithful friend to serve thee.

"E. H."

Here the records cease; but the after-history of this Quaker application is related by Whitehead in that curious picture of his own life and times printed in 1725, under the name of *The Christian Progress of George Whitehead*. Whitehead was all prayer and application for the release of his brethren in the Lord, and had intimated his intention of writing to the king to his honest and loving friend Thomas Moore,—

"Who was often willing," he says, "to move the king in behalf of our suffering friends, the king having some respect to him, for he had an interest with the king and some of his council more than many others had, and I desired him to present my few lines, or letter, to the king, which he carefully did, and a few days after both he and myself had access into the king's presence, and renewed our request."

The king listened to their application with attention and granted them liberty to be heard on the next council-day.

"And then," he goes on to say, "Thomas Moore, myself, and our friend Thomas Greene, attended at the council-chamber at Whitehall, and were all admitted in before the king and a full council. When I had opened and more fully pleaded our suffering friends' case, the king gave this answer, 'I'll pardon them.' Whereupon Thomas Moore pleaded the innocency of our friends—that they needed no pardon, being innocent; the king's own warrant, in a few lines, will discharge them, 'For where,' said Thomas Moore, 'the word of a king is, there is power.'"

The king's answer was curious—"Oh, Mr. Moore, there are persons as innocent as a child new born that are pardoned; you need not scruple

a pardon." And Sir Orlando Bridgman, the lord keeper, added, "I told them that they cannot be legally discharged but by a pardon under the great seal."

The king's Declaration of Indulgence was published on the 15th of March, 1672, and on the 8th of May the following order was given:—

"*At the Court of Whitehall, the 8th of May, 1672.*

"His majesty was graciously pleased to declare that he will pardon all those persons called Quakers now in prison for any offence committed only relating to his majesty and not to the prejudice of any other persons. And it was thereupon ordered by his majesty in council that a list of the names of the Quakers in the several prisons, together with the causes of their commitment, be, and is, herewith sent to his majesty's attorney-general, who is required and authorized to prepare a bill for his majesty's royal signature, containing a pardon to pass the great seal of England for all such to whom his majesty may legally grant the same," &c.

The following letter was sent from the council board at Whitehall to the sheriffs of the different counties:

"After our hearty commendations. Whereas, request hath been made unto his majesty, in behalf of the Quakers who remain at present in several gaols and prisons of his kingdom, that his majesty would be pleased to extend his mercy towards them, and give order for their relief; which his majesty, taking into consideration, hath thought fit, in order to his clearer information, before he resolve anything therein, to command us to write these our letters unto you; and, accordingly, we do hereby will and require you to procure a perfect list of the names, times, and causes of the commitment of all such persons called Quakers as are remaining in any gaol or prison within this country, and to return the same forthwith to this board. So, nothing doubting of your ready performance of this his majesty's command, we bid you heartily farewell."

Thomas Moore still continued his scruples before the attorney-general, and Finch, then attorney-general, told him, "Mr. Moore, if you'll not accept of his majesty's pardon, I'll tell him you'll not accept thereof." But Whitehead argued the signification of the word with his friend, and Moore's scruples were at length overcome.

The rumor soon got wind that the king had extended his Declaration of Indulgence, and consented to the release of his old enemies the Quakers. Baptists, Presbyterians, Independents, and sectaries of all kinds, "hearing of this, and seeing," says Whitehead, "what way we had made with the king for our friends' release, desired that their friends in prison might be discharged with ours, and have their names in the same instrument." Sectaries of all kinds went to the Quaker Whitehead, and earnestly requested his advice and assistance.

"Whereupon," says Whitehead, "I advised them to petition the king for his warrant to have them inserted in the same patent with the Quakers, which accordingly they did petition for and obtain; so that there a few names of other Dissenters who were prisoners in Bedfordshire, Kent, and Wiltshire (as I remember,) in the same catalogue and instrument with our friends, and released thereby, which I was also very glad of; for our being of different judgments and societies did not abate my

compassion or charity towards them who had been my opposers in some cases. Blessed be the Lord my God, who is the Father and Fountain of mercies; whose love to us in Christ Jesus should oblige us to be merciful and kind to one another."

When the pardon or patent was ready for delivery, the friends got frightened at the amount of fees properly payable upon it. The usual charge was a fee of above twenty pounds on each person, and the Dissenting sects in England were then both poor and needy. The patent enumerated the names of above four hundred persons, and the fees at the customary rate had amounted to at least ten thousand pounds. The friends of the Shoreham fisherman applied once more to the king, and the following order was issued forthwith:—

[*Locus Sigilli.*]

"His majesty is pleased to command that it be signified as his pleasure to the respective offices and sealers where the pardon to the Quakers is to pass, that the pardon, though comprehending great numbers of persons, do yet pass as one pardon, and pay but as one.

"ARLINGTON.

"*At the Court of Whitehall,*
Sept. 13, 1672."

Whitehead quaintly observes on this, "*Note,* that though we had this warrant from the king, yet we had trouble from some of the covetous clerks, who did strive hard to exact upon us."

The pardon was dated the same day, and some of the Quakers carried the deed in procession round the kingdom. "The patent," says Whitehead, "was so big and cumbersome, in a leathern case, and tin box, and great seal in it, that Edward Mann was so cumbered with carrying it hanging by his side, that he was fain to tie it cross the horse's back behind him." The original patent fills eleven skins of parchment, and is still preserved among the records of the Society of Friends. The curious reader will find it printed entire at the end of Whitehead's interesting picture of his own life, with an alphabetical key to the names which it enumerates, some four hundred in number, and all unknown to fame save one, and that one the poor and contemptible servant of Jesus Christ, as he calls himself, John Bunyan.

From this it would appear that Bunyan owed his release to the Quakers, and the Quakers their pardon to the king's recollection of the master and mate who took him on board their boat at Shoreham, and effected his escape to France after the fatal fight at Worcester. The Penderells were among the first to congratulate the king on his return, but friend Carver kept away till he had something to ask, not for himself, but for his friends suffering in the Lord. Trusty Dick Penderell had a pension for life, and trusty Dick Carver a compliance with his request, neither a small nor personal one, but large and of state importance. "He did what he did to relieve a man [that is, the king] in distress, and now he desired nothing of him [the king] but that he would set friends at liberty who were great sufferers." Bunyan might have spent the remainder of his life in prison but for the timely intercession of the Shoreham fisherman and his old enemies the Quakers. The fine old Baptist dreamer lived sixteen years after his release. Little, however, has been recorded of him in this time. Owen, we are told, admired his preaching, and when asked by Charles

II. "How a learned man such as he was could sit and listen to an illiterate tinker?" is said to have replied, "May it please your majesty, could I possess that tinker's abilities for preaching I would most gladly relinquish all my learning."

Bunyan died on the 31st of August, 1688, at the house of his friend Mr. Strudwick, a grocer, at the sign of the Star, on Snow Hill, and was buried in that friend's vault in Bunhill Fields burial-ground. Modern curiosity has marked the place of his interment with this brief inscription:—

MR. JOHN BUNYAN,
AUTHOR OF
THE PILGRIM'S PROGRESS,
OB. 31ST AUGUST, 1688.
ÆT. 60.

There is no entry of his burial in the register at Bunhill Fields, and there was no inscription upon his grave when Curll published his *Bunhill-Fields Inscriptions* in 1717, or Strype his edition of *Stow* in 1720. Many, it is said, have made it their desire to be interred as near as possible to the spot where his remains are deposited. No kind of proper veneration should be bestowed in vain; we trust, therefore, that the place of Bunyan's interment has been correctly marked.

A thoughtful mind may pass an hour very profitably in the Campo Santo of the Dissenters at Bunhill Fields. There is no outward or visible sign of attractive interest about the place. Monuments abound; but mere head-stones, with some twenty or thirty altar-tombs, and no attempt at art among the thousands that surround you. The thoughtful visitor must bring his associations with him. Dull and uninviting though it looks, the place will well repay you. Great men are buried here. Two of the best-known names in English literature are here interred, and the place has a sanctity from its first use that will fill you with awe and gratitude to God.

The site of this cemetery was part of the famous fen or moor, described by Fitzstephen as watering the walls of London on the north side. Moorfields and Fensbury Fields, now Finsbury, preserve a memory of its original condition. It was first effectually drained in 1527, when Stow, the historian of London, was two years old. The flags, sedges, and rushes, with which it was overgrown, were removed, and part was turned into pasture, and part into a city laystall. Three windmills were erected on the highest laystall. Stow mentions three, and Aggas, in his large map, confirms the accuracy of the city historian in this trifling particular. Finsbury soon became famous for its windmills, and Shirley refers to them in his play of the *Wedding*, though the allusion has been overlooked by Mr. Gifford and his fellow-assistant Mr. Dyce, in their edition of this interesting old dramatist.* Windmill street, Finsbury, perpetuates a memory of these suburban windmills.

The laystalls were removed in the third year of King James, during the mayoralty of Sir Leonard Halliday, and the fields laid out "into new and pleasant walks." The citizens affected to laugh at the mayor for his pains, and called it in derision a *Holiday* work; but when they saw what was done they ceased to laugh. The ground was then one fine level, and musters took place here. "Is this Moorfields to muster in!" says a charac-

* Shirley, vol. i., p. 421. There are two pages with this number.

ter in Shakespeare's *Henry VIII.*; and Davenant describes it, in 1634, as covered by laundresses and bleachers with acres of old linen. As the ground improved, it became a fashionable city promenade upon a Sunday; and Bassompierre, who was ambassador here in 1626, tells us that he "went to walk in the Moorfield." Shadwell commemorates the cudgel-players, and Wycherley the organ and tongs at the Gun in Moorfields. The Artillery Company removed from Bishopgate to Moorfields in the year 1622. Strype describes the relative position of the new artillery ground, "being the third great field," he says, "from Moorgate, next the six windmills."

There were three great fields appertaining to the manor of Finsbury Farm when the survey of the 30th of December, 1567, was taken.* These three fields were named Bonhill Field, Mallow Field, and the High Field, or Meadow Ground, "where the three windmills stand, commonly called Finsbury Field." "Bonhill Field containeth," says the Survey, "twenty-three acres, one rod, and six poles; butting upon Chiswell street on the south, and on the north upon the highway that leadeth from Wenlock's Barn to the well called Dame Agnes the Cleere." Wenlock's Barn no longer exists; and the well, called St. Agnes le Clair (corruptly called *Aniseed Cleer*) was, in 1761, if not before, converted into a cold bath. The efficacy of this spring is referred to by one of Ben Jonson's characters in his play of *Bartholomew Fair*.

In Queen Elizabeth's time the fields about Finsbury were the usual resort of the plainer citizens. Master Stephen, a country gull, in *Every Man in his Humor*, is indignant at the idea of being suspected, though dwelling at Hoxton, of keeping company with the archers of Finsbury, or the citizens that come a-ducking to Islington ponds. The archers of Finsbury found full employment for the bowyers and bowstring-makers, who dwelt in Grub street, immediately adjoining; but, when archery gave way to bowling-greens and dicing-houses, Grub street was tenanted by the hack authors of the booksellers in Little Britain, and the ballad-makers that befriended the rails of Bedlam and Moorfields. Grub street has since undergone another change; authors no longer inhabit this notorious locality, and Grub street is now known as Milton street, from the nearness of its locality to the last garden residence of the great epic poet of our nation.

When the great plague of 1665 broke out, of which De Foe has left so terrible a description, the field called Bonhill Field was made use of as a common place of interment for the victims of that dreadful scourge.

"I have heard," says De Foe, "that in a great pit in Finsbury, in the parish of Cripplegate, it lying open then to the fields, for it was not then walled about, many, who were infected and near their end, and delirious, also, ran, wrapped in blankets or rugs, and threw themselves in, and expired there, before any earth could be thrown upon them. When they come to bury others, and found them there, they were quite dead, though not cold."

This is a sad picture of the pleasant walks of Moorfields in the year 1665. Nor is the picture of the following year much brighter, for the dreadful fire of 1666 drove the inhabitants of

London without the walls of their burning city into the fields of Finsbury and Hoxton. Here they erected sheds and shops, living in tents like gipsies, till such time as they could return to their old localities, though not to their old habitations.

When the plague was over, the great pit in Finsbury was enclosed with a brick wall, "at the sole charges of the City of London." The convenience of the site, the size, and, if the expression may be allowed, the consecrated nature of the ground, recommended it soon after to the notice of the great dissenting sects in London, who conscientiously scrupled to the burial-service of the Book of Common Prayer. What stipulation was made with the city is unknown, but here all the interments of the dissenters took place. The city subsequently leased it to a person of the name of Tindal, the same lessee who refused to furnish Maitland with a return of the number of burials in any one year. "This obstinate refusal," says Maitland, "put me upon inquiring of John Smith, the grave-digger, who assured me that, though he kept no register, yet, in the course of his long services, he had made such observations, that he was sure they buried annually between seven and eight hundred."*

It is to be regretted that no dissenter has thought it worth his while to compose a proper account of this Campo Santo of his sect, a work much wanted and of some research. Very little or no care seems to be taken of the many memorials of the dead; the register is very imperfect, and the inscriptions are fast wearing away. No Old Mortality repairs a fading letter with religious care, and no printed book preserves anything like a mere common transcriber's account of what is daily disappearing. This should not be. A careful restoration of the better-class inscriptions might be done at a comparatively trifling cost. The sale of a sixpenny guide-book would, when the purport of its publication was fully known, more than repay, or we are much mistaken, the total of a mason's bill for this common piece of commemorative gratitude. But it must be set about soon, or it will be attempted when it is too late. We call upon the Court of Common Council, the nominal keepers of this interesting cemetery, to stir at once in the matter; and we call upon the whole body of dissenters, throughout the length and breadth of Great Britain; to put at once this Westminster Abbey of their sects in order.

We have been at some pains in compiling what must necessarily be a very imperfect account of the eminent dead who are buried in Bunhill Fields. But the task has been a pleasing one. We have succeeded in identifying, to ourselves at least, a dull, damp, and gloomy-looking square of ground, with many attractive spots, over which we may speculate when the humor is upon us. The little reveries into which men occasionally run when the workday business of the world is past, make many of the duller hours of life innocently pleasing. The churchyard of Stoke in Buckinghamshire, which suggested to Gray his inimitable *Elegy*, is, by this one circumstance alone, an interesting spot; but when we know that the poet of the *Elegy* is buried in the same churchyard, there is a further link of interest to enchain the contemplative mind to the spot a little longer.

The first person of any eminence buried in Bunhill Fields, of whom our researches will enable us

* Strype, b. iv., p. 101.

* Maitland, ed. 1739, p. 537.

to give any account, was Dr. Thomas Goodwin, the Independent preacher, who attended Oliver Cromwell on his death-bed. Cromwell had then his moments of misgiving, and he asked of Goodwin, who was standing by, if the doctrine were true that the elect could never finally fall. "Nothing could be more certain," was Goodwin's answer. "Then am I safe," said Cromwell, "for I am sure that *once* I was in a state of grace!" Cromwell foresaw that his hour was come, but Goodwin pretended not to see it, and is said to have assured him that he was not then to die. But die he did, within a very few minutes after. Yet Goodwin maintained the reality of the assurance he had received by prayer, and, at a fast at Whitehall, a week after Cromwell's death, was heard to say, in an address to God, "Thou hast deceived us, and we were deceived." This Burnet had from Tillotson, who was present and heard it. Dr. Thomas Goodwin died on the 23d of February, 1679, at the great age of eighty. His epitaph, preserved in Strype, was written, says Antony Wood, by Mr. Thomas Gilbert, of Oxford, "the common epitaph-maker for dissenters, being one himself."

The second person of eminence interred in Bunhill Fields, of whom we find a note, was the learned Dr. John Owen, dean of Christchurch, and vice-chancellor of Oxford when Cromwell was chancellor of that university. He was much in favor with his party, and preached the first sermon before the Parliament after the execution of Charles I. Cromwell carried him to Ireland and to Scotland; and Clarendon, at the restoration, offered him speedy preferment in the church. This he did not accept, but died, like Calamy and Baxter, a steady and unflinching nonconformist. He was a man of more learning and politeness than any of the Independents, and met with the esteem, as he deserved, of all parties. Dr. Owen died on the 24th of August, 1683, at the age of sixty-seven, and was buried at Bunhill Fields, in a new vault towards the east end of the ground, over which was erected an altar tomb of freestone, with a Latin inscription from the pen of a ready writer, the facile Mr. Gilbert.

The two sturdy Independents, Goodwin and Owen, were followed to the grave, in 1688, by the Baptist Bunyan,—

"The *Pilgrim's Progress* now is finished,
And Death has laid him in his earthly bed."

Fox followed Bunyan. George Fox, the founder of the sect of Quakers, is the next eminent individual buried in Bunhill Fields. His *Journal* is a scarce, but very entertaining book, and one, therefore, that should not continue scarce. He was born, in 1624, at Crayton, in Leicestershire, and apprenticed "to a man that was a shoemaker by trade, and that dealt in wool, and used grazing, and sold cattle." This is his own description of his master's pursuits, and is, as it appears to us, an exact description of the trade of Shakspeare's father, who is described as a Glover by some of his biographers, and as a considerable dealer in wool by others. Fox's master united many callings in an age when a subdivision of labor was not so much practised or so well understood as now. Is it unfair to suppose that Shakspeare's father may have done the same? Fox died in 1690, in White Hart Court, Bishopgate Street. There is no memorial to his memory,—

"Obscure the place and uninscribed the stone,"

if stone there ever was to distinguish the grave of one who deserves a monument from the sect he called into permanent existence.

The mild and peaceable George Fox was followed to his grave in Bunhill Fields by Lieutenant-General Fleetwood, the Lord-Deputy Fleetwood of the Civil Wars, Oliver Cromwell's son-in-law, and the husband of the widow of the gloomy Ireton. Fleetwood had no great brilliancy of parts, but he was a gallant soldier, though destitute of that fine soldierly quality, decision. When Monk was debating what he should do, whether he should restore the king, or continue the command of the nation in a council of officers, Fleetwood was advised by Whitelock to be beforehand with Monk, and offer his sword and services to the king. The advice was good, and Fleetwood seemed inclined to adopt it. Such, however, was his indecision, that meeting with Vane and Desborough, just as Whitelock was going away, he was induced to tie his fortunes to the sword of Lambert. The upshot of this irresolution is well known. Monk was made Duke of Albemarle by a grateful monarch Lambert banished for life to the island of Guernsey, and Fleetwood allowed to end his days in singing psalms about Hoxton and Stoke-Newington. A stone in the burying-ground of Bunhill Fields recorded the death of Charles Fleetwood, Esq., at the age of seventy-four, on the 4th of October, 1692. It was there when Strype drew up his additions to Stow, but the curious inquirer will now search in vain for any memorial of the kind.

Another memorial existing in Bunhill Fields, and preserved by Strype, was a stone to the memory of "Mr. Roger Morris, M. A., and chaplain to the late Hon. Denzil Lord Hollis." Morris died at the age of seventy-three, on the 17th January, 1701. "This gentleman," says Strype, and his name deserves remembrance for this one act alone, "was a very diligent collector of ecclesiastical MSS. relating to the later history of the English church, whereof he left vast heaps behind him, and who favored me with his correspondence." Denzil, Lord Hollis, was one of the five members impeached by King Charles I. He was a steady Presbyterian, and has left his *Memoirs* behind him full of hatred and bitterness to Cromwell, whose ends he foresaw, but could neither favor nor retard.

There is a pleasure in turning from the graves of men who filled important stations and effected very little good in their generations, to the graves of men who have been the humble instruments of important and enduring benefactions to society at large. We must own to a kind of secret pleasure which we felt in standing by the side of the tomb of Dr. Daniel Williams. This Dr. Williams, who died in 1716, was the founder of the library in Red Cross street, which bears his name. The library which Archbishop Tenison gave to the parish of St. Martin's in the Fields was not half so large, or for its size, half so important. When Dissenters, by principles of their own adoption, were excluded from the advantages of church-registration of baptism for their children, there was a register kept in Dr. Williams' library, wherein parents might enter the births of their children, with all the legal advantages of a Church of England register. Dr. Dibdin is silent on the subject of Williams' claim to be considered a *bibliomaniac*; but surely he had a greater right than very many he has mentioned

to whatever honor may rise from so uncertain a distinction.

Williams the collector, and, better still, the preserver of books for his own and for others' use, was followed to the cemetery by a seller and a writer of books of some notoriety in his day. This was old John Dunton, the bookseller, whose *Life and Errors* is still a work of authority on the lives of our old stationers and divines. His other writings are of very little value, but this one work is full of whim, information and amusement.

Dunton was followed to a grave in the burial-ground of Bunhill Fields by George Whitehead, whose autobiography, called *The Christian Progress of George Whitehead*, had been of real service to literature in preserving the true story of John Bunyan's release from gaol. All the early writings of the Quakers will well repay perusal. Fox's *Journal*, Ellwood's *Life*, Barclay's *Apology*, and Whitehead's *Christian Progress*; nor should Sewell's *History of the Quakers* be omitted from this list: it is a curious account of a sect of some historical importance from the Restoration to the death of Anne.

The two most popular books in the English language, from childhood to old age, are, the *Pilgrim's Progress* and *Robinson Crusoe*, *Robinson Crusoe* and the *Pilgrim's Progress*, for we hardly know which to place first. "Was there ever yet anything written by mere man," said Dr. Johnson, "that was wished longer by its readers, excepting *Don Quixote*, *Robinson Crusoe*, and the *Pilgrim's Progress*?" We have nothing to do with *Don Quixote*, on this occasion, but here are two out of three books which belong to England. The praise is high, perhaps excessive; but canvass England through, and you will find five ages, out of the seven ages of man, that will back the doctor in this judgment. Sir Walter Scott calls the *Pilgrim's Progress* a matchless parable, and so it is. He awards high praise, moreover, to *Robinson Crusoe*; but Mr. Hallam tells us to be careful how we break down the landmarks of Fame by placing the John Bunyans and the Daniel De Foes among the *dis majores* of our worship. We take his hint. Thank you, Mr. Hallam; but we are still of Dr. Johnson's way of thinking.

We feel, or pretend to feel, a particular kind of island pride when we stand by the tomb of Shakespeare at Stratford-upon-Avon, or the grave of Bacon, in the little church of St. Michael; or the grave of Milton, in St. Giles', Cripplegate; and our bosoms throb with feelings of national emotion when, within St. Paul's, we survey the sarcophagus of Nelson, or, in the Abbey, the graves of Chaucer, Newton, and men whose names are not confined to the limits of the sound of stupendous Bow, but are heard ringing from side to side of the four quarters of the world. We have felt this feeling, too, at Dryburgh by the grave of Scott, and at Dumfries by the grave of Burns. We have felt it, too, in Bunhill Fields, by the grave of Bunyan; and, at a short distance from his grave, by the side of some rough, rude heap of mould, which, we fancied to ourselves, lay lightly on the mouldering bones of Daniel De Foe.

Here De Foe lies buried! He was born in 1661, in the parish of St. Giles', Cripplegate, and was buried in the great pit of Finsbury, which he has described in his *Plague Year* with such terrific reality, and that one word contains the whole secret of his strength. He lies like truth; his very fictions have all the air and sincerity of a de-

position upon oath. How bare and ignorant is the entry of his burial:—

"1731, April 26, Mr. Dubow, Cripplegate."

But sextons and clerks are proverbially illiterate. The witty Farquhar is described as Mr. George *Falkvere*, in the burial-register of St. Martin's in the Fields. Sextons would have made a sad hand with the name of Shakespeare, had the poet died remote from his native Stratford. But Shakespeare returned to die among the scenes of his boyhood: the Avon was dearer to him than the Thames or the Tiber.

De Foe was followed to the grave, in 1742, by Mrs. Susannah Wesley, the wife of the Rev. Samuel Wesley, and the mother of John and Charles Wesley. John was the founder of the people called Methodists, and Charles was the first person who was called a Methodist. There is a head-stone to her memory; and in the Wesleyan chapel, over against the entry to Bunhill Fields burying-ground, a tablet to each of her two eminent sons. John Wesley died in 1791, and his remains repose in the dirty little burying-ground behind the chapel which bears his name. The Wesleyans should really see to the disgraceful state of this burying-ground. Men who differ from them in their tenets, still respect John Wesley; and when they look reverentially on his grave, should not have occasion to be offended with the dirt and neglect which they see about them.

The best-kept tomb in Bunhill Fields covers the remains of Dr. Isaac Watts, a man eminently pious and eminently a benefactor to his species. Johnson has a high and characteristic criticism upon him; but his devotional poetry he thought, like that of others, unsatisfactory:—

"The paucity of its topics enforces perpetual repetition, and the sanctity of the matter rejects the ornaments of figurative diction. It is sufficient for Watts to have done better than others, what no man has done well."

Cowper quarrels with Johnson on this point.

But Cowper, in defending Watts, was fighting the battle of his own *Olney Hymns*. No true poet (though the poet of the *Task* was a true one) will differ from Johnson in this judgment. Dr. Watts died 25th Nov., 1748, in his seventy-fifth year. There is a monument to his memory, where he well deserves to have one, in Westminster Abbey.

Eighty years elapsed before another name of eminence could be added to the list of illustrious dead interred in the plain and unpretending burial-ground at Bunhill Fields. This was William Blake, the painter. If old John Bunyan was a glorious dreamer in words, William Blake, the painter, was a gentle visionary in shapes, and fancies, and airy somethings upon paper. Blake, who died on the 12th August, 1828, should have been buried by the side of John Bunyan. There is no stone to mark the place of his interment; but the late Mr. J. T. Smith, a curious inquirer in matters of this kind, has marked the spot exactly in his *Memoir* of the painter. Blake, he tells us, lies buried at the distance of about twenty-five feet from the north wall, in the grave numbered 80. We wish some curious inquirer of the time had done as much for old De Foe. Memoranda of this description gratify thousands who take an interest in everything connected with a name eminently great: they are easily made at the time, and, if omitted, no after ingenuity of research can supply their want.

Blake, who always saw in fancy every form he drew, believed that angels descended to painters of old, and sat for their portraits. When he himself sat to Phillips for that fine portrait, so beautifully engraved by Schiavonetti, the painter, in order to obtain the most unaffected attitude and the most poetic expression, engaged his siter in a conversation concerning the sublime in art:—

"We hear much," said Phillips, "of the grandeur of Michael Angelo: from the engravings, I should say, he has been overrated; he could not paint an angel so well as Raphael."

"He has not been overrated, sir," said Blake, "and he could paint an angel better than Raphael."

"Well, but," said the other, "you never saw any of the paintings of Michael Angelo; and, perhaps, speak from the opinions of others; your friends may have deceived you."

"I never saw any of the paintings of Michael Angelo," replied Blake, "but I speak from the opinion of a friend who could not be mistaken."

"A valuable friend, truly," said Phillips; "and who may he be, I pray?"

"The archangel Gabriel, sir," answered Blake.

"A good authority, surely; but you know evil spirits love to assume the looks of good ones, and this may have been done to mislead you."

"Well now, sir," said Blake, "this is really singular! such were my own suspicions, but they were soon removed. I will tell you how. I was one day reading Young's *Night Thoughts*, and when I came to that passage which asks *Who can paint an angel?* I closed the book and cried, 'Ah, who can paint an angel?' A voice in the room answered, 'Michael Angelo could!' 'And how do you know?' I said, looking round me, but I saw nothing save a greater light than usual. 'I know,' said the voice, 'for I sat to him. I am the archangel Gabriel!' 'Oho!' I answered, 'you are, are you? I must have better assurance than that of a wandering voice. You may be an evil spirit: there are such in the land.' 'You shall have good assurance,' said the voice. 'Can an evil spirit do this?' I looked whence the voice came, and was then aware of a shining shape, with bright wings, who diffused much light. As I looked, the shape dilated more and more; he waved his hands, the roof of my study opened, he ascended into heaven, he stood in the sun, and, beckoning to me, moved the universe. An angel of evil could not have done that—it was the archangel Gabriel!"

Near the rails to that part of the ground which faces the City Road rest the remains of Thomas Hardy, secretary to, and one of the three who commenced the London Corresponding Society, but best known by his trial for treason in company with John Horne Tooke. Mr. Hardy was tried and acquitted in the year 1794, and died in the year 1832. He was a mild and inoffensive man; we speak of his later years, when the visionary schemes of his youth were subdued down to plans of a more practicable nature. He loved to talk of his trial, and of the ferment of those yeasty times.

Thomas Stothard, the last name upon our list, died the 27th of April, 1834, and was buried in Bunhill Fields. He is best known by his "Canterbury Pilgrimage," and his illustrations to the "Italy" and smaller poems of Rogers; but his best works, to our thinking, are his illustrations of "The Pilgrim's Progress" and "Robinson Crusoe." He was fond of drawing "Christiana

and her children," and "Christian with the Pilgrim." The great work of De Foe was frequently before him, and one of his most impressive designs was from this favorite author—"Robinson Crusoe on his lonesome isle, scared with the print of a man's foot upon the sand." It is long since we have seen it, but its image is still unmistakably before us. There is no thinking of this incident in De Foe in any other shape than the way in which it is drawn by Stothard. He loved De Foe for the truth and reality of his descriptions, and De Foe had loved him in return for the unaffected beauty of his designs. It is right they should lie together.

THE SONG OF SEVENTY.

I AM not old—I cannot be old,
Though threescore years and ten
Have wasted away, like a tale that is told,
The lives of other men.

I am not old: though friends and foes
Alike have gone to their graves,
And left me alone to my joys or my woes,
As a rock in the midst of the waves.

I am not old—I cannot be old,
Though tottering, wrinkled and gray;
Though my eyes are dim, and my marrow is cold,
Call me not old to-day.

For early memories round me throng,
Old times, and manners, and men;
As I look behind on my journey so long
Of threescore miles and ten:

I look behind, and am once more young,
Buoyant, and brave, and bold;
And my heart can sing, as of yore it sung,
Before they called me old.

I do not see her—the old wife there—
Shrivelled, and haggard, and gray;
But I look on her blooming, and soft, and fair,
As she was on her wedding-day.

I do not see you daughters and sons,
In the likeness of women and men;
But I kiss you now as I kissed you once,
My fond little children then.

And as my own grandson rides on my knee,
Or plays with his hoop or kite,
I can well recollect I was merry as he—
The bright-eyed little wight!

'T is not long since—it cannot be long—
My years so soon were spent,
Since I was a boy, both straight and strong,
Yet now am I feeble and bent.

A dream, a dream—it is all a dream!
A strange, sad dream, good sooth;
For old as I am, and old as I seem,
My heart is full of youth.

Eye hath not seen, tongue hath not told,
And ear hath not heard it sung,
How buoyant and bold, though it seem to grow old,
Is the heart, forever young;

Forever young—though life's old age
Hath every nerve unstrung;
The heart, the heart is a heritage
That keeps the old man young.

1. *Meteorological Observations and Essays.* By JOHN DALTON, D.C.L., F.R.S. First Edition, 1793. Second Edition, 1834.
2. *A New System of Chemical Philosophy.* By JOHN DALTON. Part I., 1808. Part II., 1810. Vol. II., 1827.
3. *Memoirs of the Literary and Philosophical Society of Manchester from 1793 to 1836.*

THE recent decease of Dalton, the greatest of English chemists, and one of the most distinguished cultivators of general physics, has naturally awakened a desire, on the part of many, to know something concerning his scientific discoveries and personal history. No satisfactory account has been hitherto published either of the former or the latter. We trust that the following sketch will go some way towards supplying this deficiency.

John Dalton was born at Eaglesfield, near Cockermouth, in Cumberland, on the 5th of September, 1766. His father, Joseph Dalton, was originally a person of no property, but after the death of an elder brother, he became possessed of a small copyhold estate, which he farmed with the assistance of his sons. He had six children, of whom only three survived to maturity—Jonathan, John, the subject of this article, and Mary. The first-named of these obtained the estate on the decease of his father, and retained it till his own death, in or near the year 1835, when it became the property of John Dalton.

Joseph, the father, though straitened in circumstances, strove to give his family the best education within his means, and John attended a school conducted by a member of the Society of Friends, named John Fletcher, until he had attained his twelfth year. We have no means of knowing anything concerning the nature or amount of the instructions which he received at this school, (the only one he ever attended; but he is said "to have made very considerable progress in knowledge," and he always spoke with respect of his early preceptor. That he did make such progress, and that he gave early proof of rare energy and natural capability, we may gather from the fact, that at the age of twelve or thirteen, he commenced a school in his native village, and persevered in teaching during two winters.

So modest, unassuming, and conscientious a man, as Dalton proved himself in after-life to be, must have been conscious, even at that early age, of the possession, both of knowledge, and of the power to impart it, or he would not have committed himself to so difficult a task. How he prospered in it we are not told, but probably not greatly, for we learn that his vacant time was occupied in assisting his father upon his farm; and he is said to have taken part in the labor of altering the farm house. He manifested a strong tendency towards mathematical pursuits when very young, and had some assistance in the prosecution of his taste in that respect from a gentleman named Robinson, who, along with his wife, an accomplished woman, directed the studies of the young philosopher.

In 1781, at the age of fifteen, Dalton removed to Kendal, where his cousin, named George Bewley, then resided, as the teacher of a boarding school, with whom the brother of Dalton had lived as an assistant. Dalton succeeded his brother in this office, and resided in Kendal till 1792, actively

engaged in learning and teaching mathematics and the physical sciences. During his residence in that town, he attracted the attention of Mr. Gough, a blind gentleman, who, in spite of his misfortune, was devoted to the study of physics and natural history. Mr. Gough had an excellent library and some apparatus, which he placed freely at the disposal of Dalton, who soon became his assistant and companion. The service required was of a light and pleasant description, and the blind philosopher, who was possessed of excellent natural abilities, and had obtained a liberal education, appears to have acted the kindest part towards Dalton, who, in return, was never weary of expressing his sense of obligation to his benefactor. When Dalton published his *Meteorological Essays*, in 1793, he said, in reference to Mr. Gough—"If there be anything new, and of importance to science, embraced in this work, it is owing, in great part, to my having had the advantage of his instructions and example in philosophical examination." And although we may believe that Dalton's modesty led him somewhat to over-estimate his obligation to Mr. Gough, there can be no doubt that a person whose early education had been comparatively so neglected, must have derived the greatest benefit from intercourse with such a person as the latter is described to have been. After his death, and so late as 1834, Dalton spoke of him as a prodigy in scientific attainments, considering the disadvantages under which he labored, and added—

"There are few branches of science in which he did not either excel, or of which he had not a competent knowledge. Astronomy, optics, pneumatics, chemistry, natural history in general, and botany in particular, may be mentioned.

"For about eight years," continues Dalton, "during my residence in Kendal, we were intimately acquainted. Mr. Gough was as much gratified in imparting his stores of science as I was in receiving them; my use to him was chiefly in reading, writing, and making calculations and diagrams, and in participating with him in the pleasure resulting from successful investigations; but as Mr. Gough was above receiving any pecuniary recompense, the balance of advantage was greatly in my favor, and I am glad of having this opportunity of acknowledging it."

From the year 1784 to 1794, we find Dalton contributing largely to two works, of some celebrity in their day, but now little remembered, entitled, "The Gentleman's and the Lady's Diary." In 1788, he commenced his meteorological observations, which led, directly or indirectly, to all his great discoveries, and were continued till the day before his death. In 1793, he published his first work—"Meteorological Observations and Essays," to which more particular reference will be made hereafter.

Some time previous to the appearance of that publication, Dalton had thought of qualifying himself to practise either as a physician or a lawyer, and corresponded with a friend in London on the subject. But his views were changed in consequence of the receipt of a letter, by his friend Mr. Gough, from Dr. Barnes, making inquiry for a gentleman to fill the situation of Professor of Mathematics and Natural Philosophy, in the new college, Mosley-street, Manchester. Dalton's offer to undertake the duties was accepted, and he removed, in 1793, to Manchester, where he spent the remainder of his days.

The year after settling in that town, Dalton

joined a society, which had been established for some time, under the title of the "Manchester Literary and Philosophical Society." To the transactions of this body—the most celebrated of all our provincial scientific associations—he contributed a series of papers, containing the results of original researches of the highest value. These, along with a few others on kindred subjects, have conferred on the society's periodical publications, best known as the "Manchester Memoirs," a celebrity which has extended beyond the nations of Europe. Dalton resided for about six years within the Mosley-street institution, and continued to officiate there till the college was removed to York, in 1799, when he began to teach mathematics and natural philosophy privately, at the charge, it is said, of eighteen-pence an hour.

In this humble occupation he was engaged, when, in 1804, he unfolded the laws which he had discovered to regulate the proportions in which substances combine chemically with each other, along with the hypothesis, by means of which he accounted for their existence and expounded them. The laws and the hypothesis are generally, though erroneously, taken together, and included under the single title of his "Atomic Theory."

Here, then, we may, for awhile, arrest the course of purely biographical detail, and leaving Dalton teaching his mathematics at eighteen-pence an hour, turn to the consideration of his scientific discoveries.

We need scarcely say that it will not be possible to offer more than the briefest sketch of these; and that even this will be out of our power, unless we confine ourselves to the chief points in relation to them. We shall select, therefore, his "Atomic Theory" as the main subject of illustration, and consider his other discoveries as they stand related to it. Great unity, and the impress of intellectual consistency, are stamped on all Dalton's labors. With few exceptions, they bear closely and directly upon each other, and on the atomic hypothesis of combining proportion, to which they ultimately led, and round which they naturally group themselves. The method which we shall follow, will serve, accordingly, both to bring out the nature and value of his discoveries in science, and to indicate the train of speculation and inquiry by which he was conducted to them.

As the first step, towards this, we have to consider the laws of proportional combination which are universally received as true by chemists. They are four in number, and refer to combination by *weight*; the laws of combination by *volume* being excluded from our present inquiry. Three of them were discovered by Dalton; all of them were brought into new prominence by his labors; and his atomic theory, or rather hypothesis, as it should be called, is an endeavor to explain them, by assuming a peculiar ultimate constitution of matter, which absolutely necessitates their existence. These laws are based upon one, deeper and more fundamental than themselves, which is assumed in their enunciation, and is to the following effect:—*The same compound consists invariably of the same components.* Water, for example, always consists of oxygen and hydrogen; common salt, of chlorine and sodium; vermilion, of sulphur and mercury. Exceptions to this law were at one time thought to exist, in the case of certain minerals and native gems, such as garnet, which seemed to exhibit constant physical characters,

and yet to vary in their constituent ingredients. But Mitscherlich's discovery of Isomorphism not only solved the difficulty attending the consideration of these, but in the end supplied new confirmation of the law which at first it seemed to contradict. This, then, premised, we may enter at once on the consideration of the following laws:—

The first of these is generally named the law of *Definite proportion*, but should rather be called the law of *Constant proportion*. It teaches, that the elements which form a chemical compound are always united in it in the *same* proportion by weight. Water not only consists invariably of oxygen and hydrogen, but the weight of oxygen present is always eight times greater than that of hydrogen. Whether we obtain it from lake, or river, or sea, or glacier, or iceberg; from rain, or snow, or hail, or dew; from the structures of plants or the bodies of animals; whether it has been formed ages ago by the hand of nature, or is produced on the instant by mingling together its elements in the most random way, the ratio of its components is immutably the same: eight-ninths of its weight are always oxygen, and the remaining ninth, hydrogen. It is the same with every compound. Common salt always contains 35 parts of chlorine to 22 of sodium; marble, 22 of carbonic acid to 28 of lime; vermilion, 16 of sulphur to 101 of mercury. In virtue of this law, a number can be found for every body, simple or compound, expressing the ratio in which (or in a multiple or submultiple of which) it combines with every other. Any series of numbers may be taken to represent these combining ratios, provided the due proportion is maintained among them, so that the number for oxygen shall be eight times greater than that for hydrogen, that for nitrogen fourteen times greater, that for sulphur sixteen times, that for iron twenty-seven times, and so on, according to the relations which analysis brings out. Different scales of combining numbers are in use among chemists; but the only one we need consider is that which makes hydrogen 1, and counts from it upwards. The numbers in this scale are all small, and do not, in the majority of cases, go beyond two integers.*

It must not be forgotten that such tables represent relative, not absolute weights. Of the smallest possible quantity of oxygen which can combine with the smallest possible quantity of hydrogen, we know nothing; all that we are certain of is, that it is eight times greater than that of hydrogen, whatever that be. None of the numbers taken singly has any absolute value: the 16, for example, which, in tables of the kind we are discussing, stands against sulphur, does not represent 16 grains, 16 millionths of a grain, or any other absolute quantity: its value appears only when it is taken in connexion with the number attached to hydrogen, to which the quite arbitrary value of 1 has been given. We may give any value we please to any one of the elementary bodies we choose to fix upon for a commencement, and call

* In conformity with the universal practice of chemists, in illustrating the laws of combining proportion, we have here, and elsewhere throughout this paper, employed round numbers, cutting off the decimal fractions, by which the exact combining proportions exceed or fall short of these. The equivalent of oxygen, for example, is not 8, but 8.01; that of nitrogen, not 14, but 14.06; and so on with many others. The equivalents of a few of the elementary bodies are round numbers: carbon is 6; calcium, 20: the greater number are not.

it 1, 10, 100, &c., or any other integer or fraction; but here our liberty ceases. The relation between the numbers is absolute, though their individual value is not; and from the settled figure we must count upwards or downwards, or both ways, so as to maintain inviolate the relative values throughout the series.

The law we are discussing, as we have already stated, is generally called that of *definite* proportion, but, as we think, erroneously; for it asserts something more than that the proportion in which the elements of a compound unite is *definite*; it affirms, also, that it is *constant*, or always the same. The elements of a compound *must* be united in definite proportion. A definite weight of water, for example, must consist of a definite weight of hydrogen and of oxygen; but the proportion of these elements might be quite variable, so that one specimen of water should be found to contain 1 hydrogen to 8 oxygen; another, 8 hydrogen to 1 oxygen; a third, a moiety of either ingredient; and so on, *ad infinitum*.

The native garnet, to which reference has already been made, is always a definite compound; but the proportion of its ingredients varies within wide limits, so that while one specimen contains 27 per cent. of a certain constituent *alumina*, another does not contain 1 per cent. The alum of the dyer may in the same way contain a proportion of peroxide of iron, varying in different specimens from 1 to 90 per cent.; and differences in the ratio of ingredients as great as these occur in all the combinations of what are called isomorphous bodies. These garnets and alums, however, are in reality mixtures in variable proportions of quite constant compounds, and offer no exception to the law we are discussing: but they illustrate what is manifestly quite possible, that constancy in physical character, and constancy in the nature of the constituent ingredients, might coexist with inconstancy in the *proportion* of the latter. Now Dalton's first law affirms, in contradiction to this possibility, that the proportion of elements in a compound is in every case as constant as their nature; a truth which the title, "Law of *definite* proportion," does not bring out, whilst that of *constant* proportion not only does, but in addition includes all that the former expresses; for a *constant* proportion must of necessity be a *definite* one also.

For these reasons, we press upon the reader the propriety of avoiding the singular and almost unaccountable confusion which exists in many of our best works in the use of the word *definite*, as equivalent to *constant*, and name the law—that of constant proportion.

This law applies to all bodies, organic and inorganic, native and artificial, so that in the light of our earth, with its atmosphere, may be considered as the sum or complement of an almost infinite number of compounds adjusted by weight, and told to the tale; and in a sense as mathematically true as it is poetically sublime, we may understand the declaration of an inspired writer, that God "has weighed the mountains in scales and the hills in a balance."

The law of constant proportion was known before Dalton's time, and had been distinctly announced by several chemists in different countries towards the close of last century. We can scarcely doubt that it had been fully apprehended, in many quarters, before it was specially proclaimed. Every chemist who undertook the

analysis of a substance must have blindly or intelligently taken for granted that it would prove *definite* in composition; and most of them, we may readily believe, connected with this a more or less clearly discerned expectation that it would prove *constant* in composition also. This length, certainly, Bergman the Swede, our own Cavendish, Lavoisier, and many others, had reached, in their observations and speculations on the combinations of bodies; but it was made the subject of special demonstration by two German chemists, Wenzel and Richter, and by a French chemist, Proust, who published their respective works between the years 1777 and 1792. The views of the German chemists will come better under our notice when discussing the third law of combining proportion; those of Proust deserve more particular mention here, as they were published in consequence of a discussion carried on between him and the celebrated French chemist, Berthollet, as to the existence of such a law as the one we are considering. Berthollet asserted that the number of compounds which any two elements can form with each other is quite unlimited, and that constancy of physical characters, such as specific gravity, color, taste, &c., is no sign of constancy in chemical composition. Proust affirmed, on the other hand, that the number of compounds formed by two elements, such as iron and oxygen, is always limited, and often very small; and that so long as the physical characters remain unchanged, the chemical composition is equally invariable. The evidence adduced by him was so ample and incontrovertible, that the discussion ended in satisfying every chemist of the truth of his views.

The second law of combining proportion is related to the circumstance, that the same elements, in almost every case, combine in more than one proportion to constitute several compounds. Even the beginner will be prepared for this, if he is aware that the chemist has, in the mean while, reduced all kinds of matter to some fifty-six primary ones, and has the whole world to account for out of these. This law is named that of *Multiple Proportion*, and enforces the remarkable truth, that when one body combines with another in several proportions, the higher ones are multiples of the first or lowest. Oxygen and hydrogen, for example, which in water are united in the ratio of eight of the former to one of the latter, unite to form a second compound, named the peroxide of hydrogen, in which the oxygen is to the hydrogen as 16 to 1; or, the hydrogen remaining the same, there is exactly twice as much oxygen as in water. There are two compounds of hydrogen and carbon remarkable as being the bodies which suggested this law to Dalton. In the one of these, (*olefiant gas*,) there are six parts, by weight, of carbon, to one of hydrogen; in the other, (*marsh gas*, or *fire-damp*,) there are six parts of carbon to two of hydrogen; or, the weight of carbon being the same in both, there is exactly twice as much hydrogen in the first as in the second. One of the most remarkable examples of this law occurs in the compounds of nitrogen and oxygen, which are five in number. The proportion of nitrogen is the same in all, and may be represented by the number 14, while that of the oxygen, which in the lowest, may be expressed by 8, in the second is 16, or twice 8; in the third, 24, or three times 8; in the fourth, 32, or four times 8; and in the fifth, 40, or five times 8; the higher proportions are multiples of the lowest, by

2, 3, 4, and 5, at which last number, in this case, they stop. In every series of compounds we find the same law operating. If a substance can combine with more than eight parts of oxygen, the least next quantity it combines with is 16. It never combines with 8 and 2-3ds, 8 and 4-5ths, 8 and 9-10ths, or any other fraction whatever; but if it overstep the eight, goes right on to the 16 before it is again saturated. It may go past the 16, but in that case it cannot stop at any intermediate number, but must proceed to 24. It need not halt at 24, however, if it can go on to 32; or at 32, if it can combine with 40; and it may pass at once from 8 to 40, or to any other quantity, however large, provided it be a multiple of the original 8. The only unalterable decree is, that whatsoever smallest quantity of one body another can combine with, every higher compound must contain in increasing multiples.

In all the cases referred to, binary compounds have, for the sake of simplicity, been taken for illustration, and they have been such, that one of the elements has remained constant in quantity, while the other has increased in the higher or more complex compounds, by multiples of the quantity found in the lowest or simplest. But cases are quite common where both of the elements of binary compounds, and all those of more complex ones, occur in multiples of their smallest combining quantities. One illustration from a small series of binary compounds may suffice. There are three well-known compounds of iron and oxygen. In the first, we have 27 parts of iron to 8 of oxygen; in the second, 54 of iron to 24 of oxygen, or the proportion of iron is doubled, and that of oxygen tripled; in the third, we have 81 iron to 32 oxygen, or the iron tripled and the oxygen quadrupled.

This law reigns through all nature, and is so manifest, that it scarcely calls for fuller illustration. Those who are quite unfamiliar with chemical speculation, however, may perhaps be able to grasp it more firmly by means of the following comparison:—A compound body is with great propriety likened to a chain, while the separate links of which the latter is made up represent its constituent ingredients. In accordance with this view, let each of the elementary bodies be represented by a link of a different length. To carry out the analogy fully, there should be a difference also in the material, color, shape, and other attributes of the different representative links. For the sake of simplicity, however, we shall exclude the consideration of everything but the difference in length, and shall further suppose it to be such that all the links representing hydrogen are one inch long; those representing oxygen, eight inches long; those representing nitrogen, fourteen inches long, and so on with the links symbolizing the other elementary bodies, according to the differences between the numbers expressing their combining proportions, by weight. If, then, we proceed to construct a chain by attaching these links to each other, the length of the chain will in every case be a multiple of the length of the individual links of which it is constructed. Let us, for example, connect a link of nitrogen fourteen inches long with one of oxygen eight inches long, which will give us a double link twenty-two inches in length. This is the shortest chain we can have made of these links, and will represent the lowest, or simplest compound of nitrogen and oxygen. If we proceed to lengthen it by the

addition of oxygen links, we may add a single additional one, or two at once, or five, or ten, or a thousand; but whatever be the number we add, the length in inches of the part of the chain made up of oxygen links will always be a multiple of the original eight, which expressed the length of a solitary link. No fractional number will ever appear, for the chain is made up of links, none of which can be shortened, so as to be shorter than eight, or lengthened, so as to be longer.

In like manner, we might weave together, in utter darkness, and in the most random way, complicated net-works, consisting of links of different lengths, representing the fifty-six elementary bodies. But when our handiwork was brought to light, and the length of the chain-work contributed by each kind of link measured, it would invariably prove to be a multiple of the length of the primary links, by the interlacement of which the whole had been fashioned.

The law of multiple proportion belongs peculiarly to Dalton. He generalized it from a solitary case, that of the compounds of carbon and hydrogen already referred to, where the law at first sight strikes us less than it does in many other cases, as it appears only in the duplication of the numeral 1, representing hydrogen, which is taken as unity. It was sufficient, however, to suggest it to Dalton, who unhesitatingly predicted its applicability to all kinds of compounds. He had been so far anticipated in this by one chemist, a Mr. Higgins, of Pembroke College, Oxford, afterwards Professor of Chemistry at Dublin. In a work published by that gentleman, in 1789, entitled "A Comparative View of the Phlogistic and Antiphlogistic Theories," he states, according to Dr. Daubeny, that one ultimate particle of sulphur and one of oxygen constitute sulphurous acid, whilst one ultimate particle of sulphur and two of oxygen constitute sulphuric acid; and, moreover, that in the compounds of nitrogen and oxygen the ingredients are to each other in the proportion of 1 to 1, 2, 3, 4, and 5, respectively. Mr. Higgins' work excited no attention at the time of its publication, nor for many years after. It was not, indeed, till Dalton's re-discovery and re-announcement of the law, that his views on the subject became generally known. It seems doubtful, indeed, if he was aware of the importance of the law he had discovered, but it should not be denied that he clearly saw and fully announced it as applying to several compounds; nor should it be forgotten, in estimating his merit, that when he published his views, there existed so very small a number of accurate analyses, that it was impossible to test its truth on any but the most limited scale. But after conceding this, we shall be guilty of no injustice to Mr. Higgins, if we say, that had he seen the value and importance of the law as fully as Dalton saw it, he would have done as Dalton did, who spent ten or twelve of the best years of his life in verifying its truth by analyses of as large a series of compounds as he possibly could compass. We shall have occasion again to refer to Higgins in connexion with Dalton; meanwhile we proceed to the consideration of the next law.

The third law of combination is named that of *reciprocal proportion*, and is to the effect, that if two bodies combine in certain proportions with a third, they combine in the very same proportions with each other. Thus 16 parts of sulphur combine with 8 of oxygen, and 27 parts of iron com-

lime with 8 of oxygen; but 16 parts of sulphur is the very quantity that combines with 27 of iron. We may reverse the numbers: 8 of oxygen combines with 27 of iron, and 16 parts of sulphur with 27 of iron; but 8 of oxygen is the very number that combines with 16 of sulphur. Or a third time: 8 oxygen and 27 iron combine respectively with 16 sulphur; but 27 iron is the quantity that combines with 8 oxygen.

This law is not only of the greatest theoretical interest, but of the utmost practical value to the chemist. But for its existence, his labors as an analyst would be endless, and the work of a lifetime would go but a short way in ascertaining the combining proportions of a single substance. As it is, however, if the proportion be ascertained in which one body combines with any one other, that, or a multiple or submultiple of that, is the proportion in which it combines with every other with which it can combine at all. A new metal, for example, *Didymium*, has been discovered by the Swedish chemist, Mosander, the combining proportion of which is still uncertain. To ascertain this, it will not be necessary to discover by actual trial what quantity of it unites with a certain weight of each of the other elementary bodies; it will suffice to know the proportion in which it unites with one of them, oxygen; this, with the qualification already stated, will be the proportion in which it combines with all the rest.

It is in relation to this law more than to the others that the combining weights of bodies are named their *equivalents*; the best title by which they can be distinguished. This term expresses, in a way no other does, that a certain weight of one body is equivalent to, or goes as far as, a certain but different weight of another in the construction of a similar compound. One part by weight of hydrogen, for example, goes as far in combining with eight of oxygen to form an oxide, as 27 of iron, 33 of zinc, 96 of platinum, or 199 of gold. These compounds have all the same value; the weight of oxygen is the same in all, and the 199 parts of gold do not neutralize the 8 of oxygen 199 times more effectually than the one of hydrogen does, but only as well and with the production of a *similar* compound. The same remark applies to the different but equivalent quantities of all the other substances referred to.

This law of reciprocal proportion was discovered by the German chemist, Wenzel, already mentioned, who published his views on the subject in 1777, in a work of great merit, which attracted, however, no attention at the time of its publication. In this he showed, from certain phenomena exhibited by neutral salts when they decompose each other, that the proportions in which bodies combine with each other were both constant and reciprocal. His views were taken up and followed out by his countryman, Richter, who began to publish in 1792, and confirmed the truth of Wenzel's conclusions by observations made on the precipitation of metals from solution, by each other. Richter's greatest merit, however, consisted in an endeavor to ascertain, by a series of most patient analyses of different salts, the exact weight of acid and base required for mutual saturation, and to express this by a number attached to each.

He spent some twelve years of his life in this labor, and published various works on the subject, but his views attracted as little notice as Wenzel's, and it was not till after his death that Berzelius obtained for them the attention they deserved.

All are now agreed, that though his numbers are wrong, and very far wrong too—a remark which applies equally to Dalton's first similar table—his name will ever be honorably connected with the earliest attempt to lay the foundation of quantitative chemistry.

The fourth and last law we have to consider is a very simple one, and will not require much illustration. It may be called the law of *Compound Proportion*, and teaches that the combining proportion of a compound body is the sum of the combining proportions of its components. The combining proportion of water, for example, is found by experiment to be 9, (or a multiple of 9,) hydrogen, as before, being taken as unity; but nine is the sum of 8 parts of oxygen, and 1 of hydrogen, its constituents. The equivalent of carbonic acid appears upon trial to be 22; but carbonic acid is found on analysis to consist of 6 parts of carbon and 16 of oxygen, which exactly make up 22. The combining weight of lime is 28, but lime consists of 20 calcium and 8 oxygen, which are also 28. Lastly, marble has the combining proportion 50, but it is composed of 22 carbonic acid and 28 lime, which are also 50.

This law is of as much interest and practical value as the preceding one, and supplies the chemist with a most important mean of checking the results of empirical analysis in the case of compound bodies. The merit of discovering it belongs entirely to Dalton. It followed so directly and unavoidably from his atomic hypothesis, that its existence was implied in the very enunciation of the latter; and we think we do not err when we say that chemists are so much accustomed to consider this law in the light of that hypothesis, that the possibility of its existence apart from it is altogether forgotten.

Independent, however, it certainly is of any hypothesis, and it could not have been deduced from the other laws we have just been discussing.

Although the atomic hypothesis had never been devised, it might, and certainly would, have been discovered; and though that hypothesis should prove utterly false, it will remain equally valid, resting, as it does, on the ground of direct experimental evidence. We are the more induced to dwell on this, that even so distinguished a person as the Rev. Mr. Whewell, Master of Trinity College, Cambridge, has failed to perceive the independence and value of this law of compound proportion; and in the discussion of Dalton's Atomic Theory in the History of the Inductive Sciences, does not so much as once mention or allude to it. The error, whether it arose from ignorance of the law, or from the supposition that it was deducible from the laws of reciprocal and multiple proportion, is almost inexplicable, and quite inexcusable.

On these four laws modern chemistry is based. It has been said, indeed, of them, that chemistry before their discovery was only an art, but by their recognition became a science. But this is to say too much: chemistry, as a qualitative science—*i. e.*, as a science treating of the qualities or properties of bodies, existed before their discovery, and might have existed in a state of considerable perfection as such, although they had had no place in nature, or that place had never been discovered. Their peculiar effect is to confer upon chemistry the character of a science of quantity, which till they were brought to light it did not possess; but in so doing they widened and made more accurate its

range as a science of quality. For, to take but one example, we could not with absolute certainty affirm that water consists of hydrogen and oxygen, and of nothing else, unless we were able to show that a given quantity of water, subjected to analysis, yields weights of hydrogen and oxygen, which, taken together, are identical with that of the water analyzed.

These laws, it is important to observe, contain in them nothing hypothetical. They sum up the results of the universal experience of chemists, (so far as experience can be called universal,) of which they are the expressions. With the exception of the law of constant proportion, they were wrought out by Dalton for himself, and by him first fully made known to the world. He did not expound them, however, in the way we have done, but employed in their enunciation the language of the ingenious and beautiful hypothesis which had led him to the discovery of two of them, and supplied a satisfactory explanation of them all. This hypothesis, generally called the atomic theory, we are now to consider.

Dalton began by assuming that matter, although it may in essence be infinitely divisible, is, in fact, only finitely divided, so that it consists of certain ultimate particles or molecules possessed of a definite and unchangeable weight, shape, and size. These particles he named, as others had already done, *atoms*, from the Greek, *ἄτομος*, (*that which cannot be cut or divided*.) to signify that they were indivisible. The indivisibility attributed to them, however, was not affirmed to be absolute, so that they could not by possibility be reduced in dimensions, and broken up into smaller particles, but was held to exist in relation only to the chemical and other disintegrating forces existing in nature, none of which were supposed able to divide them. According to this view, then, ponderable masses or volumes of the different elementary bodies were supposed to consist of a countless multitude of undivided atoms.

On the shape of these atoms, Dalton offered no opinion, though he thought it probable that they were spherical, and drew them as such in his diagrams. Neither did their size enter as an element into his speculations, and it need not into ours; all, indeed, that we know on the subject or can affirm is, that they are inconceivably small; so small, indeed, that to say how many could stand at the same time on the point of the finest needle would be a problem as difficult for the modern physicist, as it was hard for the schoolmen of the middle ages to decide, how many angels could be accommodated at once on the same airy pinnacle.

Up to this point there was nothing novel in Dalton's views. For centuries an atomic constitution of matter had been held as probable by many, and defended by all the arguments that physics and metaphysics could supply. For the sake of contrasting these earlier views, which were almost purely physical, or referred to the atoms of homogeneous combinations of matter, with those of Dalton, which were chemical, or had reference to the atoms of heterogeneous compounds, we shall quote the exposition of one of the ablest of Dalton's predecessors.

"All things considered," says Newton, "it seems probable that God, in the beginning, formed matter in solid, massy, hard, impenetrable, movable particles, of such sizes, figures, and with such other properties, and in such proportion to space, as most conduced to the end for which he formed

them; and that these primitive particles, being solids, are incomparably harder than any porous bodies compounded of them; even so very hard as never to wear or break to pieces, no ordinary power being able to divide what God made one in the first creation."

Newton, it will be observed, says nothing concerning the weight, either absolute or relative, of his primitive particles. The former was manifestly beyond the reach of human discovery, and nothing was known in his day which could throw any light on the latter.

It is here that Dalton, introducing the question of weight, leaves Newton behind, and takes not a step, but a stride, in advance of all previous speculators on atoms. His early physical inquiries, as we shall afterwards find, had accustomed him to form the clearest and most precise conceptions of matter as made up of atoms, and as soon as he obtained the faintest glimpse of the laws of combining proportion, he connected it with these familiar speculations, so that his atomic hypothesis rose into full perfection before he had completed the analysis of so many as a dozen compounds.

This immediate perfection was given to his hypothesis by the one bold conjecture, that the ultimate atoms of the elementary bodies do not possess the same, but different weights; and that the difference between their weights is identical with that which subsists between the combining proportions of the elements themselves. As oxygen, for example, has a combining proportion eight times greater than that of hydrogen, so the ultimate atom of oxygen is assumed to be eight times heavier than the ultimate atom of hydrogen. As the combining proportion of nitrogen is fourteen times that of hydrogen, so the atom of nitrogen is supposed to be fourteen times heavier than that of hydrogen; and in like manner the relative weights of the atoms of the other elementary bodies are supposed to differ by the same numbers that the relative weights of their combining proportions differ by. Dalton, it will be observed, no more than Newton, pronounces on the absolute weight of his atoms; all, in truth, that he could have said on that point would have been, that they were so inconceivably light, that it would require millions of the heaviest of them to turn the most delicate balance. But he thought, that if it were possible by any means to select single atoms of each of the elementary bodies, and weigh them, one by one, we should find, *first*, that different atoms of the same element possessed all the same weight, so that whatever was the absolute weight of any one would be found to be the weight of each of the others of the same kind; and if one atom of hydrogen weighed the millionth of a millionth of a grain, each of the hydrogen atoms would weigh the millionth of a millionth also; *secondly*, we should find that all the oxygen atoms were 8 times heavier than the hydrogen ones; all the nitrogen, 14 times heavier; all the silver atoms, 108 times; all the gold atoms, 199 times heavier. In short, the proportions in which bodies combine with each other are supposed to depend upon the weights of the atoms which make them up, and to be identical with them. All the numbers, accordingly, which before this hypothesis is considered, represent combining proportions, as soon as it is adopted, come to represent weights of ultimate atoms, or atomic weights.

According to this view, then, when bodies com-

bine together, their ultimate particles do not interpenetrate, or become fused together, so that the individuality or identity of any is lost. The atoms only come into close proximity, and lie side by side, or above and below each other; and when the compound they form is decomposed, they separate, and reappear with all their original properties. The smallest possible quantity of water is in this way conceived to consist of one atom of hydrogen and one of oxygen, bound together, without loss of the individuality of either, by the unknown and invisible tie which we term chemical affinity.

Such is the atomic hypothesis: how beautifully it explains all the laws of combining proportion will appear on a moment's reflection. A law of constant proportion, such as we have learned, must obtain in the combinations of atoms, possessed of the properties Dalton assumed, for their relative weights are unalterable, and there is therefore but one lowest, or smallest, proportion in which they can combine. The weight of an atom of oxygen is 8, and that of an atom of hydrogen, 1. It is impossible, therefore, that their smallest combining proportions, by weight, should be any others than 8 and 1.

A law of multiple proportion is equally necessary, for an atom of one element is the smallest quantity that can be added to a compound containing an atom of it already, and whatever was the weight of the first atom will be that of the second also, so that an exact duplication of the first proportion, without any fractional lack or excess, must take place. And if more than one atom be added at a time, it must be atoms, not an atom and a half, or one and a third, or any other fraction or fragment, for this cannot be, seeing that the atom is indivisible.

In the five compounds of nitrogen and oxygen already considered, the first, which contained 14 of the former to 8 of the latter, was to be taken as a compound of a single atom of each. The second must contain 16 oxygen, because the next highest compound must be one of two atoms; the third, 24, because there are three atoms, each weighing 8, the fourth, 32, because the atom is quadrupled; and the fifth, of necessity, 40, for a similar reason.

It is almost unnecessary to continue the application of Dalton's hypothesis to the other two laws, it is so direct and unavoidable. The law of reciprocal proportion is an inevitable result of the constancy in weight of the atom. For if an atom of iron is found to be twenty-seven times heavier than one of hydrogen when weighed along with one of oxygen, and if an atom of sulphur be sixteen times heavier than one of hydrogen when also weighed with one of oxygen, then the atom of iron will continue to weigh 27, and that of sulphur 16, when they are weighed together; for these were the weights of the iron and the sulphur atoms before they combined; they remain so during their combination; and will reappear so whensoever they separate. In a word, the weight of an atom is a constant quantity; it cannot be lessened, or increased, or annihilated. Finally, the law of compound proportion is so necessary, that it was anticipated through this hypothesis before it was found in nature. There could not fail to be such a law, in virtue of the constancy in weight, and the indivisibility of the atom. For the aggregation of atoms does not alter their weight, and the atom cannot divide, so that its weight should be

shared among smaller molecules. Had the atom been divisible, it might have been otherwise, and when two or more atoms entered into combination, they might have broken up into lesser particles, among which the original weight was parcelled out. In this way, the compound made up of them might have had the same, or a smaller combining weight than that possessed singly or together by its components. According to the atomic hypothesis, the combining proportion, or atomic weight of water, is necessarily 9, because it consists of two atoms weighing respectively 8 and 1. But if these had not been indivisible, they might have broken up in the act of combining, and yielded not one particle weighing 9, but, for example, nine particles, each weighing 1, so that the combining weight of each particle of water should have been no greater than that of the original particles of hydrogen.

Such, then, was the chemical doctrine of atoms, in its first announcement, as related to the laws of proportional combination by weight. Before we consider the steps by which Dalton was led to its announcement, or proceed curiously to dissect and criticise it, let us stop for a moment to give it the deserved tribute of our admiration. It claims this at our hands, on the two-fold ground of its beauty as a method of expressing the order and symmetry of material nature, and its value as a means of apprehending and inculcating great chemical truths. We may afterwards find it unnecessary to concede to Dalton's atoms the attribute of indivisibility, even in the limited extent to which he conferred that property upon them, and see reason to believe that a potential, or virtual, not an actual atom is all that chemistry requires for the solution of her problems: nay, that the potential is better than the actual atom for the explication of many of them. But placing the question of its truth aside for the present, we cannot forbear to mark the grand idea which the Daltonian atomic hypothesis gives us of the law and order which prevail in nature.

In the light of it, there is nowhere any "fortuitous concurrence of atoms," as the Roman poet claimed of old; no crash or collision, no strife or warfare, when they meet together, as Milton sang, in relation to the embryon atoms of his chaos. According to this view, the courses of the planets around the sun are not more surely ordered than the movements of these invisible spheres round the centres of force which they obey. Arcturus and Orion know not their places better than each tiny gold or hydrogen atom which adds its weight to swell the sum total of the universe. And if poets of old have sung of the music of the spheres which the telescope unfolds to us, poets, we doubt not, will yet be found to sing of the harmony, as true and as wonderful, which attends the movements of those which the finest microscope will never reveal. Nay, we know not that we have to wait for a poet to do so, for one who will never be excelled has declared to us that—

"There's not the smallest orb—

But in his motion like an angel sings."

We might recur to our simile of the chain-work, and speak of atomic nature as a glorious garment woven out of links of different kinds, which Infinite Wisdom, at the first creation, forged of the shape, and length, and size, which it best fitted each of them to possess.

Or we might liken these atoms to coins stamped in nature's mint, of definite and unchangeable value, with which she pays all the demands the animate and inanimate world make upon her; but this illustration falls much below the dignity of the theme.

Rather would we have recourse to that old and familiar, but lofty and suitable one, which speaks of this world as a temple;—a temple built by God to his own glory and for the good of his creatures. And if we did so, we should speak of it, not as of a Cyclopean wall piled out of unwieldy and misshapen blocks, flung, as if by Titanic hands, together; nor as of a Tower of Babel, where, amidst confusion of tongues, one asked for bricks and another gave him mortar; but as of a structure such as the Hebrew king built to his God, where "the house, when it was in building, was built of stone made ready *before it was brought thither*," and the "great stones, costly stones, and hewed stones," were each carved and chiselled, to fit its appointed place, before the builder began, "so that there was neither hammer, nor axe, nor any tool of iron heard in the house while it was in building;" but,

"Out of the earth, a fabric huge
Rose like an exhalation, with the sound
Of dulcet symphonies and voices sweet
Built like a temple."

On the atomic hypothesis, considered merely as a figment or artifice for expressing simply the laws of combining proportion, it is unnecessary to say much, its value in this respect is so apparent. To the student, who with difficulty has been struggling to form a clear conception of equivalents, proportions, and the like, which, after all, he apprehends only as shadowy, ponderable masses of equal value, the passage is like that from morning twilight to full day, when he grasps firmly the idea of different atoms like separate spheres, each a perfect whole, possessing a definite and unalterable weight. The movements and relations of the equivalent atoms can thereafter be as readily followed in thought by the chemist in his speculations, as those of suns, or of planets and their satellites by the astronomer, in the calculations which the science of the heavenly bodies demands. Nor is any revelation which chemistry seems destined to undergo, even should it bring about the decomposition of all the so-called elementary bodies, likely to lessen, or even much to alter, the value of the atomic hypothesis, considered as a device for inculcating chemical truths. On this subject, therefore, we say no more, but at once pass to a question of the highest interest.

The first glimpse of his "Atomic Theory" was obtained by Dalton in the course of certain researches into the solubility of the different gases in water, which he published in the *Manchester Society's Transactions* for the year 1802. In 1804, he "touched upon it in his lectures" in Manchester and at the Royal Institution in London, and, in the same year, he explained it in conversation to Dr. Thomson, of Glasgow, who spent a day or two with him at Manchester. By the latter chemist, and not by Dalton himself, it was first explicitly made known to the world, in the third edition of his "System of Chemistry," published in 1807, four years after its first partial announcement to the Manchester Society. In the same year, Dalton expounded his views in a course of lectures delivered in Edinburgh and in Glasgow,

the greater part of which, however, was devoted to the exposition of his discoveries in relation to heat; and in 1808, the substance of these lectures was published in his well-known work, entitled "New System of Chemical Philosophy." We cannot, therefore, consider the atomic theory as having come fully before the world till the latter year.

Up to the present time, so far as we are aware, no attempt has been made to trace the steps by which Dalton was led to his greatest discovery, although the evolution of these in a systematic way would have strengthened almost incalculably the argument of those who sought to defend his merits against the claims of British and foreign rivals: and the history of their development would have been welcomed by all who took an interest in scientific inquiry.

We shall endeavor, so far as our limits permit, to supply this deficiency; premising, however, that we have not had access to any private sources of information, but derive our knowledge solely from works which are, or may be, in the hands of all. In nearly every one of the memoirs which have been published concerning Dalton and his discoveries, we are simply told, in the words of Dr. Thomson, that the "atomic theory" first occurred to the former during his investigation of olefiant gas and carburetted hydrogen, which were imperfectly known when he undertook their investigation. A conclusion naturally drawn from this statement is, that the laws of combining proportion were discovered in the course of an analytical inquiry, undertaken expressly for the purpose of ascertaining what they were, and that the atomic hypothesis was devised, after the laws were discovered, as a means of explaining and expounding them. It was not so, however. On the other hand, we shall presently see that it was in the course of a purely physical inquiry into certain of the properties of a single class of bodies, the gases, that Dalton was arrested by a difficulty which obliged him to analyze several of those which are compound, such as the carburetted hydrogens. The result of these inquiries so completely fell in with his previous speculations, that he flung forth his atomic hypothesis as soon as he met with a single case of combination in multiple proportion.

The path along which Dalton travelled was somewhat like the following:—The blind gentleman, Mr. Gough, who exercised so beneficial an influence over his early days, added to his other tastes a love for meteorology. "It was he," Dalton tells us, "who first set the example of keeping a meteorological journal at Kendal;" and his pupil appears to have soon acquired a relish for the same study. Doubtless he was influenced likewise by the magnificent scenery around him, of which he has left some eloquent descriptions, and was tempted by the peculiar facilities which the locality of his residence afforded for every kind of meteorological inquiry. At all events, he commenced in 1788 those daily observations which were continued for fifty-five years, and led to the publication, in 1793, of the "Meteorological Essays," already referred to. It was impossible for Dalton, however, to content himself merely with recording the risings and fallings of the thermometer and barometer, or with counting the number of inches of water in his rain-gauge. Yet to take up meteorology as a science, was to enter on a study which required for its suc-

careful prosecution a knowledge of almost every one of the other physical sciences; and even their concentrated light, when directed upon it, did not suffice for the solution of more than a small number of the problems which perplexed the student at the time that Dalton entered on his inquiries. The theory of the winds was exceedingly obscure; the connexion between alterations in the temperature of the atmosphere and the fall of rain or dew, or the opposite phenomenon of the spontaneous evaporation of water from the surface of the earth, was completely misunderstood: the nature of the force which elevated the vapor of water into the air, and maintained it and the other gases of the atmosphere in a state of equable diffusion through each other, in spite of great differences in relative density, had not been recognized; and the chemical composition of the air, and many other points of the highest importance, were either greatly misapprehended or utterly unknown. Much assistance towards the elucidation of these difficulties might doubtless have been derived from works published before Dalton commenced his researches. But a single private library could supply but a very small number of these, and no public collection of books appears to have been within his reach while at Kendal. He was, moreover, eminently a self-reliant man, and debarred from books of which it must be acknowledged, even when he could get them, he was no great reader, he set to work to solve, by actual experiment, the problems which his meteorological studies had brought into view. Little could be done towards this whilst he resided among the lakes, but as soon as he reached Manchester, he gave himself assiduously to such employment, and the two great objects of his researches were the laws which regulated the action of heat in changing the forms of bodies, the discovery of which was certain to throw light upon the questions of dew, rain, hail, evaporation, &c., and the physical constitution of vapors and gases, which bore upon almost every question in meteorology. A very brief review of Dalton's earlier contributions to the Manchester Society's Memoirs will show the exact nature of these inquiries, and serve the important incidental purpose of giving the reader some acquaintance with his purely physical researches. Our space will not allow us otherwise to refer to these, but in commenting thus scantily upon them, we would not omit noticing that, as it has often happened in other cases, the greatness of one of Dalton's discoveries has thrown into shade all his others. It is certain that, although he had never unfolded his views on chemical atomics, he would have taken a very high place among men of science; and we encourage the belief that the method we are adopting in expounding his views, will have the effect of linking together in their natural connexion his physical and chemical speculations.

The first paper, read October 31st, 1794, is entitled, "Extraordinary Facts relating to the Vision of Colors," and referred to a remarkable peculiarity in his perception of the tints of bodies which will be considered in another place. The second, read March 1st, 1796, contains "Experiments and Observations to determine whether the quantity of Rain and Dew is equal to the quantity of Water carried off by the Rivers, and raised by Evaporation; with an inquiry into the origin of Springs;" and may be considered a demonstration, in the eighteenth century, of the truth of what the wise king had declared some thousand years before—"All the rivers run into the sea,

yet is the sea not full; unto the place from whence the rivers come, thither they return again." The third communication, read April 12th, 1788, entitled, "Experiments and Observations on the power of Fluids to conduct heat," was an ample and satisfactory refutation of Count Rumford's supposition, that fluids were non-conductors of caloric. It does not, however, particularly concern us. In the fourth paper, (June 27th, 1800,) "Experiments and Observations on the Heat and Cold produced by the mechanical condensation and rarefaction of Air," he returns to inquiries connected with meteorology. The next contributions, read October 2d, 16th, and 30th, 1801, but published in one memoir, are his celebrated "Experimental Essays on the Constitution of mixed Gases; On the force of Steam or Vapor from Water and other liquids in different temperatures, both in a Toricellian vacuum and in air; On Evaporation; On the expansion of Gases by Heat." The only section of this elaborate memoir to which we can refer is the first. It affirms the startling and apparently incredible proposition, that, "when two elastic fluids, denoted by A and B, are mixed together, there is no mutual repulsion amongst their particles—that is, the particles of A do not repel those of B, as they do one another; consequently, the pressure or whole weight upon any one particle arises solely from those of its own kind." Guided by this remarkable idea, Dalton proceeds to the consideration of mixed gases, and particularly of the atmosphere, and applies his views with great success to the removal of the difficulty attending the consideration of the cause of the constant composition of the air we breathe. To all previous speculators, who denied that the air was a chemical compound, as Dalton did, there remained unanswered the question—How do the constituents of the atmosphere exist in a state of equable diffusion through each other, in spite of the difference in their relative densities? Should not the heavier, oxygen, be found near the surface of the earth; the lighter, nitrogen, in the higher regions? No difference exists in this respect, and Dalton's hypothesis takes away all necessity for there being any. We have referred to this subject with a view to direct the reader's attention to a plate which is placed at the end of the paper, illustrating the constitution of our atmosphere as consisting, according to this hypothesis, of gases self-repulsive, but indifferent to each other. The particles of oxygen are represented by small rhombs or diamonds; those of nitrogen, by dots; those of carbonic acid, by triangles; and those of aqueous vapor, by asterisks. The reader will see the importance of this reference, as showing that, two years before he published his "atomic theory," Dalton had accustomed himself to the most precise views as to the properties of masses or volumes of bodies, resulting entirely from those of their ultimate particles, and pictured these to himself and to others by various significant symbols. There was not, probably, among the men of science of his time one who apprehended more clearly than he did that the properties of any mass, however great, are in every case the sum or the difference, or otherwise the expression, of the properties of the ultimate molecules, particles, or, as he afterwards came to call them, atoms, of which it consists. It is to be observed, however, that the word atom nowhere occurs, but is represented in every case by the equivalent term, "ultimate particle."

We pass over the next paper, which records

"Meteorological Observations made at Manchester, from 1793 to 1801," and take up the succeeding ones, which are closely connected with the essay we have just been discussing.

The first was read November 12th, 1801, and is entitled, "Experimental Inquiry into the proportion of the several Gases or elastic Fluids constituting the Atmosphere." Its title sufficiently explains its object. It was followed, in January 28th, 1803, by an essay "On the tendency of elastic Fluids to diffusion through each other;" a remarkable paper, carrying out the observations of the older pneumatic chemists, and especially Priestley, that elastic fluids of different specific gravities, if once diffused through each other, do not separate by long standing, so that the heaviest is found lowest, but remain in a state of uniform and equal diffusion. Dalton showed further that gases intermix with each other independently of agitation, although the one be much heavier than the other: so that carbonic acid, which is twenty-two times heavier than hydrogen, will rise into the latter, and the hydrogen conversely descend into it. The subject was afterwards more fully examined by Professor Graham, of London, in a memoir of the highest interest.

We have nearly completed our abstract. The next paper, read October 21st, 1803, the last, probably, in which, from its title, "On the Absorption of Gases by Water and other Liquids," the reader would look for it, contains the first announcement of Dalton's discovery of the laws of combining proportion, and the germ of the "atomic theory." After stating the laws which he had found to regulate the absorption of gases by water, he proposes a theory in explanation of it, according to which he contends that gases, such as oxygen, nitrogen, carbonic acid, &c., when in aqueous solution, are mechanically mixed with water, not chemically combined with it—a view which has not been adopted by other chemists. "Gases so mixed with water," says he, "retain their elasticity or repulsive power among their own particles, just the same in the water as out of it, the intervening water having no other influence, in this respect, than a mere vacuum!" He goes on to compare his gas dissolved in water to a pile of shot—"a particle of gas pressing on the surface of water is analogous to a single shot pressing upon the summit of a square pile of them;" and on the opposite page he has inserted an engraving of a pyramidal pile of balls left unshaded, with a dark ball surmounting the apex. This is entitled, "View of a square pile of shot, &c." The lower globes are to represent particles of water; the top globe represents a particle of air resting on particles of water." Further on are two other engravings, the one of a "Horizontal view of air in water," the other a "Profile view of air in water," in which dots and crosses are taken to represent particles of air, with spaces of water between them. We have specially referred to these engravings, as affording additional illustrations of the hold which a belief in the atomic constitution of matter had taken of Dalton's mind, and the use which he made of it in discussing purely physical problems, (or, at least, what he considered such,) before he had occasion to apply it to chemical questions at all. At the close of the essay comes the acknowledgment of the difficulty which attends a hypothesis of mechanical absorption. If the mingling of gases with liquids, on which they do not act chemically, be but a

mechanical action, like the mingling of indifferent gases with each other, how happens it that water dissolves its own bulk of one gas, such as carbonic acid, and only three per cent. of its volume of another, such as oxygen. We should expect, if the mechanical view were true, that all gases should be equally soluble in water; for if water act as a vacuum would do, it must act in the same way on every gas. Dalton saw the difficulty, and devised a hypothesis to overcome it. We give his own words:—"Why does water not admit its bulk of every gas alike! This question I have duly considered, and though I am not yet able to satisfy myself completely, I am nearly persuaded that the circumstance depends upon the weight and number of the ultimate particles of the several gases: those whose particles are lightest and single being least absorbable, and the others more, according as they increase in weight and complexity." To this there is a foot-note—"Subsequent experience renders this conjecture less probable." And the text is followed by a passage which we print in italics—"An inquiry into the relative weights of the ultimate particles of bodies is a subject, as far as I know, entirely new; I have been prosecuting this inquiry with remarkable success." On the succeeding page is a "Table of the relative weights of the ultimate particles of gaseous and other bodies." This was the first table of atomic weights, and every one of them was wrong, with the exception of hydrogen, which was assumed as unity. We extract four of the numbers:—

Hydrogen	1
Oxygen	5.5
Carburetted hydrogen from stagnant water	6.3
Olefiant gas	5.3

Such, then, were the steps by which Dalton was conducted to the discovery of the laws of combining proportions. He was testing, by experiment, the truth of a hypothesis as to the cause of the specific solubility of gases in water, which proved in the end to be quite untenable: but, like Columbus, who missed an El Dorado, but found an America, he discovered something better. From what Dr. Thomson tells us, he was struck by observing that the quantity of hydrogen in fire-damp is exactly twice that in heavy carburetted hydrogen, the quantity of carbon being the same in both. His constant reference of the properties of masses to those of their smallest molecules led him at once to connect these proportions, in which the carbon and hydrogen occurred, with the relative weights of their ultimate particles. We may suppose him to have reasoned somewhat thus—"Hydrogen and carbon are made up of particles which have different weights, the carbon atoms being all six times heavier than the hydrogen ones; but if hydrogen and carbon have atoms differing in relative weights; oxygen, nitrogen, and every other elementary substance will have atoms differing in relative weight also; and these may be ascertained by finding the relative weights according to which the masses made up of them combine with each other." To Dalton's mind, filled, as it were, already with the conception of everything consisting of atoms, it was only necessary to introduce the additional idea of these atoms differing in relative weight, and all the laws of combining proportion rose at once into view. He was gifted with a bold, self-reliant, far-glancing, generalizing spirit, and the researches he had long been prose-

ating had doubtless strengthened greatly that faith in the uniformity of nature's laws which we all inherit as an essential part of our mental constitution. We may believe that, without an effort, and almost instinctively, he would infer that if hydrogen followed a law of multiple proportion in its higher combinations with carbon, a similar relation would be found to hold in every case where the same elements united to form more than one compound. The detection of the other laws of combining proportion must have been immediate; but this has been so fully illustrated already, that we need not enter on the subject again. It must never be forgotten that Dalton's atomic views gave him the same advantage in detecting the laws of chemical combination which they afford us in apprehending and expounding them.

In confirmation of the view we have taken of the development of the atomic hypothesis, we would refer to Dalton's contributions to the first six volumes of the "Manchester Memoirs," which, gone through consecutively, will conduct every reader, we believe, to the conclusion we have arrived at. It is confirmed by Dalton's reference to the carburetted hydrogens already considered, and by the way in which Dr. Thomson introduces the earliest published account of the atomic theory, not while discussing chemical affinity or the laws of combination, but quite abruptly under the head of the density of the gases. Dalton himself always connected his later chemical with his earlier physical discoveries. When he published the second edition of his "Meteorological Essays," in 1834, forty-one years after the publication of the first, he said, in reference to the few alterations it contained—"I have been the more anxious to preserve the first edition unchanged, as I apprehend it contains the germs of most of the ideas which I have since expanded more at large in different essays, and which have been considered discoveries of some importance."

We wind up this long discussion with a single remark. Dalton's views of chemical combination, including both the facts and the hypothesis which expressed and explained them, are generally known as his "Atomic Theory." To Dalton himself the evidence in support of the existence of ultimate indivisible particles appears to have seemed so conclusive, that he considered the doctrine of atoms in the light of an induction from the data furnished by observation and experiment; and this without reference to any other than purely physical questions. We cannot, indeed, sufficiently reiterate that he was an atomist before he was a chemist. In his lips, therefore, the name "atomic theory" was consistent, and had a clear meaning. It was John Dalton's atomic theory of chemical combining proportions; his theory of atoms connected with his discoveries in chemistry, so as at once to account for, and to expound them. To those, however, who cannot by any process of generalization establish to their own satisfaction, or to that of others, the actual existence of atoms, (and it includes almost every who one thinks on the subject at all,) and for whom the doctrine of atoms is only a questionable, and, we may say, an indifferent hypothesis, Dalton's view is "an atomic hypothesis of combining proportion." It matters comparatively little, however, whether we say atomic theory or atomic hypothesis, provided we keep perfectly distinct what is matter of assumption concerning atoms, from what is matter of fact concerning laws of combining proportion.

The only chemist who has adopted Dalton's views is Dr. Thomson, who affirms that "unless we adopt the hypothesis with which Dalton set out—namely, that the ultimate particles of bodies are atoms incapable of further division, and that chemical combination consists in the union of these atoms with each other—we lose all the new light which the atomic theory throws upon chemistry." Dalton's other contemporaries—Davy, Wollaston, and Berzelius—on the other hand, protested against confounding the question of atoms with that of combining proportions, and declined to employ the word atom. Davy substituted the term *proportion*; Wollaston, that of *equivalent*—the best of all the titles by which the combining weight of a body can be indicated. Notwithstanding this, it is notorious that the word *atom* is universally employed; the phrase *equivalent* comparatively seldom. Some of Dalton's less discriminating admirers have built much upon this, as showing that even the opponents of an atomic view of matter are obliged to use its phraseology. This is true so far as the word *atom* is concerned; but in the language of a chemist of the present day, that term has no other meaning than the phrase *equivalent*; to which it is preferred only, we believe, because it contains half as many syllables, and is more easily pronounced. Liebig has justly observed that the use of the word *atom* is like that of the term *element*. The latter does not signify a body that *cannot be*, but only one that *has not been decomposed*: *atom*, not a particle which cannot be, but only one which, up to a certain point, has not been divided. Hence the chemist has no scruple in applying the term *atom* to a group of molecules considered as a whole, although he is quite certain that this compound whole may be, and often is, divided. He speaks, for example, of an atom of water, of carbonic acid, of sugar, and the like.

The announcement of the atomic theory to the chemists of Europe was like a lighted torch passed round among lamps, trimmed and filled with oil, and ready to be kindled. Some heard with incredulity, like Davy; others with gladness, like Thomson; none, probably, without astonishment, that the humble teacher of mathematics, had extracted more meaning out of his imperfect and even inaccurate analyses than they, even Berzelius and Wollaston, out of their scrupulously exact ones. It was so, however. In Spain, France, Germany, Sweden, and elsewhere, many were seeking to discover the laws regulating chemical combination, every one of them probably acquainted with a wider range of chemical phenomena, and a better analyst than Dalton; but he beat them all. So true is it, what Thomas Carlyle says, that "the eye sees what it brings the power to see." No great discovery, perhaps, was ever welcomed so heartily and immediately as the announcement in the atomic theory of the laws of combining proportion. The chemists looked over the analyses recorded for other purposes in their laboratory books, and found on every page ample confirmation of Dalton's discoveries. Davy, Thomson, Wollaston, but above all, Berzelius, furnished every day better proofs than Dalton himself could show, that in every essential point his views were as just as they were beautiful and original. The question of Dalton's exact merit was at one time a good deal discussed, and is certain to be made matter of discussion again, as soon as a complete memoir of him is published.

The sketch we have given of the path by which the atomic theory was reached enables us, we think, to set at rest the question of the rival claims of Higgins and others.

In deciding the question of merit in reference to any scientific discovery, three points require in every case to be considered. The first—The question of time—Who earliest made the discovery? The second—The question of desert—Who had the greatest merit in making it? The third—The question of practical effect—Who aroused the world by his discovery, and made it tell upon the progress of science? The last is, if not the only, at least the main point in the popular estimation of the merits of discoverers. It is the peculiar office of a journal such as ours to see that the two former receive at the hands of all equal consideration.

The question of time admits of no dispute. The law of constant proportion had been recognized by Bergmann and Proust, not to mention others, before Dalton's time, nor did he ever claim its discovery. The law of reciprocal proportion was made out completely by Wenzel and Richter, in 1777. The law of multiple proportion was recognized clearly and fully by Higgins, in 1789. The law of compound proportion was discovered by Dalton in 1803. This is the state of matters so far as time is concerned, and leaves no choice in the adjudication of merit in regard to the question of priority of discovery. Justice admits of no degrees. We should be as honest in handling our neighbor's character, as in handling our neighbor's money: as careful to protect the reputation of the forgotten Higgins as to exalt the memory of the immortal Dalton.

So far as intrinsic merit is concerned, we take it for granted that no one will call in question Dalton's honesty, or doubt that when he said "an inquiry into the relative weights of the ultimate particles of bodies, is a subject, so far as I know, entirely new," he faithfully expressed his entire ignorance of what Wenzel, Richter, and Higgins had done before him. It is certain, that, in 1803, the views of these writers were quite unknown in Great Britain, even to those most conversant with the scientific literature of the day, and that Dalton did not become acquainted with the views of Higgins at least, until the year 1810. If this be acknowledged, it follows that Dalton's merit as a discoverer is at least equal to that of his three predecessors taken together, for he found out for himself the laws which they only made out among them, and brought to light another, of which they were ignorant altogether.

The question of practical effect has been considered already. We have seen that it was Dalton who changed the state of chemistry. Dalton! who while his contemporaries were with difficulty building up a fragment of scaffolding here and there at separate corners, with the far distant hope of ultimately raising by their combined efforts the structure of chemistry another story, was in silence preparing to supplant them all; Dalton, who with the aid of a cunning engine of his own devising, uplifted at once the four corners, and planted the stately edifice on a new and stable basement, from which it towered above the bogs and quicksands which had been like utterly to overwhelm it before.

Four reasons may be given why Dalton's views on combining proportion should have attracted more attention than those of his predecessors.

First—Chemistry was riper and readier for the discussion of laws of combination than in the days of Wenzel or Richter, or when Higgins first wrote.

Secondly—Dalton's atomic hypothesis made the apprehension of the laws taught by means of it infinitely more easy than it had been before.

Thirdly—All the laws of combining proportion were taught together, and made to tell with their united force upon the mind.

Fourthly—Dalton's high character as a discoverer, and his wide reputation among men of science before he announced his atomic theory secured for it an immediate attention which was not shown to the works of his less distinguished predecessors.

In ending the discussion of the question of merit, we would express our hope that no inconsiderate admirer of Dalton will rob his predecessors of their scanty, but hard-earned laurels, to add an insignificant leaf or two to his full-crowned head. He would have been the first himself to reject any such borrowed honors.

Here we resume the long dropped thread of biographical detail. Our space will not allow us to prosecute it to any considerable extent. We have deemed it better, however, to discuss at some length those great questions connected with Dalton's discoveries and scientific reputation, which have never been brought before the public, than to occupy the reader with matters, however interesting, connected merely with his personal history, many of which have been published already in various ways.

Between the years 1803 and 1810, Dalton was occupied in the prosecution of analyses to verify his atomic theory; in teaching mathematics; and in delivering lectures in Manchester, London, Edinburgh, Birmingham, Leeds, and Glasgow. He was not a fluent speaker, nor had he any great talent for teaching. He declined, however, all the offers made by his friends to provide him with a competency, so that he might devote his undivided attention to scientific pursuits. To such overtures he replied, "that teaching was a kind of recreation, and that if richer, he would not probably spend more time in investigation than he was accustomed to do."

For many years he had the usual fate of the prophet, and "received no honor in his own country." He had always around him in Manchester, however, a small circle of appreciating friends, who did all they could to extend his fame. In 1814, they had his portrait painted by Allen, and an engraving was made from it, which has long been out of print. In 1817, they conferred on him a further mark of their esteem by electing him president of the Literary and Philosophical Society, of which he had long been the most distinguished member. He was re-elected every year till his death.

When Sir John Ross sailed on his first polar voyage, government and Sir Humphry Davy together thought it a fitting opportunity for doing Dalton a service, and offered him the post of natural philosopher to the expedition. But he declined the appointment, probably thinking that the North Pole would not present many advantages for confirming by experiment his atomic theory; and if they had been very anxious to serve him, they might have found better means, and nearer home, for so doing. He continued, accordingly, at Manchester, teaching, experi-

menting, and writing scientific memoirs; and we find nothing remarkable to record till the year 1822, when he visited France. He carried with him to Paris a single letter of introduction to M. Breguet, a celebrated chronometer-maker, and member of the French Institute. He could not have been introduced in a better quarter. Breguet was well known to the Parisian *savants* as the inventor of a metallic thermometer which bears his name; and being wealthy and fond of the society of men of science, was in the habit of assembling them round his table. He was well acquainted, moreover, with Dalton's researches, especially those upon heat, and at a former period had sent him a present of one of his thermometers. Through Breguet, Dalton was immediately introduced to La Place, and by him to all the more distinguished French philosophers. He was subsequently invited to the meetings of the Institute, where he was most heartily welcomed, and during the whole period of his residence in Paris was treated, both in public and in private, as one whom all delighted to honor.

The generous appreciation of his merits shown by the French, as contrasted with the indifference to these exhibited by all but his personal friends and a few men of science among his countrymen, made a strong impression upon Dalton. Although a man of few words, little given to betray his feelings, and very indifferent to applause, he was so moved by his reception as to say, when he returned home—"If any Englishman has reason to be proud of his reception in France, I am that one."

At length his countrymen became more alive to his merits; and if we have to acknowledge that the Celtic fire of our Gallic neighbors blazed forth into admiration at a time when our colder Saxon natures had scarcely begun to glow, it must be admitted, on the other hand, that when the latter began to warm, they rose steadily to a red, even to a white heat of unbounded admiration. For the last ten years of his life, Dalton was the object of universal esteem among his countrymen.

In 1826, the council of the Royal Society of London unanimously awarded to him the royal gold medal of fifty guineas value, placed at their disposal by George IV. But it is to the British Association for the Advancement of Science that Dalton was indebted for the estimation in which latterly he was held.

He attended its earliest meeting at York, in 1831, where he was seen for the first time by many who had long esteemed him at a distance, and now rejoicing in an opportunity of vying with each other in showing him respect.

At the next meeting of the association, held at Oxford, in the following year, the university conferred upon him the title of Doctor of Civil Law. In 1833, when the association met at Cambridge, the president, Professor Sedgwick, took a public opportunity of expressing his regret that the university could not honor herself, as the sister one had done, by conferring upon Dalton an honorary degree, as these cannot be granted without royal mandamus. At the close of his speech, he announced "that his Majesty King William IV., wishing to manifest his attachment to science and his regard for a character like that of Dr. Dalton, had graciously conferred on him, out of the funds of the civil list, a substantial mark of his royal favor. This "substantial mark" was a pension of

150*l.*, which was raised to 300*l.* in 1836. It is not generally known, but we have the best authority for stating it, that the Rev. Dr. Chalmers was the first to rouse the government to a sense of Dalton's claims. To his purely professional and literary accomplishments, the celebrated Scotch divine adds no inconsiderable acquaintance with most of the physical sciences, and the widest sympathy with the progress of them all. In early life, he is known to have been an indefatigable experimenter, and has even lectured to select audiences on heat and on chemistry. Knowing well what Dalton's merits were, he visited him at Manchester, and was surprised and pained to find him an obscure, ill-remunerated teacher of mathematics. Dr. Chalmers lost no time in expostulating, by letter, with Joseph Hume, on the injustice of suffering such a man as Dalton to go unrewarded. His claims were acknowledged even by that rigid economist, and soon after the first pension was accorded him.

We have already seen that Dalton declined to avail himself of the offers of his friends to provide him with a competency, which should set him free from the necessity of elementary teaching. This was in the days of his robust manhood; and we think he did right. We know no reason why the man of science, so long as he is full of health, should not take his share in bearing the burden "under which the whole creation groaneth and travaileth"—why he should be exempt from the common lot of earning his bread by the sweat of his brow. We are sure, moreover, that the joys even of a hard-earned independence will more than compensate, in every case, for the fancied advantages of an undeserved and an inglorious leisure. It is very different when age has overtaken the man who has labored while he had strength, and who has spent his days in extending that knowledge by which all men are gainers. Such a one, even though his studies have been of the most purely speculative and apparently unpractical kind, may fitly be saved from the gripe of poverty "when the grinders cease because they are few, and those that look out of the windows be darkened," by the kindness of his less gifted but more wealthy fellow-men. But the claims of the worn-out man of science are still greater, when he has been the author of discoveries which have enabled his quite unscientific brethren to "reap where they had not sown, and gather where they had not strown." Then it becomes a matter of justice, not of generosity, that he who has been the invisible sower of the seed which has produced, in some cases thirty, in some sixty, and in some an hundred-fold, should receive his tithe of the fruits of the field. The pension which government allowed to Dalton might be regarded as a generous gift to the author of "Experiments and an Hypothesis on the Constitution of mixed Gases." But to him who unfolded the "atomic theory" it was only a moderate, we had almost said a niggard dole. Three hundred pounds a-year! What a small fraction was that of the countless sums which he had saved his country—which he had won for her. The application of the laws of combining proportion to the practical arts enabled the manufacturer of glass, of soap, of pigments, of medicinal substances, of dyes, of oil, of vitriol, and of many other bodies of great commercial value, to secure their production without waste, or loss, or any unnecessary expenditure. Dalton could tell such a man, to a grain, the exact quantity of

each ingredient, which required to be added to produce a given compound. Three hundred pounds a-year! If Joseph Hume could obtain as good an account of every 300*l.* sent out of the treasury, he would be a happy man, and England a happy country.

In the same year, 1833, in which Dalton received his first pension, a number of his friends subscribed the sum of 2000*l.*, and employed Chantrey to execute a full-length statue of him in marble. This beautiful work of art, which gives a fine likeness of Dalton, is erected in the entrance hall of the Royal Manchester Institution.

Dalton went to London to give Chantrey the requisite sittings for his bust, and while there was most cordially welcomed by men of science. Nor was this all. Through the influence of Mr. Babbage, the mathematician, of Lord Brougham, who was then Chancellor, and of some other friends, he was presented to William IV. From the account of a Manchester gentleman, who was well acquainted with the facts, we learn that "with great skill all the minute preparations for his appearance in such august presence were made by his friends, and arrayed in the pompous vestments of a Doctor of Oxford, with the scarlet gown and black cap, the silk stockings, the buckles, and the whole paraphernalia of a learned courtier, our townsman mingled in the crowd of soldiers, sailors, statesmen, and divines, who thronged the splendid apartments of St. James', where he was very graciously received by the king." Whether his London friends acted wisely in introducing such a man to his majesty, not as John Dalton, the great chemist, but as Dr. Dalton, of Oxford, we shall not stop to inquire.

In 1834, Dalton attended the meeting of the British Association at Edinburgh, where every sort of kindness and new honors awaited him. The university conferred upon him the degree of LL.D., the Royal Society elected him a member, and the town council presented him with the freedom of the city.

In 1835, he was present at the Dublin meeting of the association; where all parties, from the lord-lieutenant downwards, vied with each other in extending to him the marks of their esteem.

We have now reached the seventieth year of his laborious career, and it will not surprise the reader that the silver cord should be beginning to be loosed, the golden bowl to be broken at the fountain.

In 1837, when in his seventy-first year, he suffered from a severe attack of paralysis, which left his right side powerless, and also deprived him of speech. He experienced a second slight attack on the 31st of the same month, and for some time both his mental and bodily faculties appeared to be much affected. After an illness of some months, however, his health improved, and his mind began to evince something of its former vigor, though his articulation always remained less distinct than before. We are indebted to the Manchester Guardian for these particulars, and from the same able journal we take, with a few slight alterations, the following statements relative to the close of the career of John Dalton:—On the 17th of May, 1844, he had a third paralytic stroke, which partially deprived him of the use of his right side, and increased the indistinctness of his utterance. He recovered in some degree from this attack also, and on the 19th of July, 1844, was present at a meeting of the council of the Manches-

ter Literary and Philosophical Society, where he received an engrossed copy in vellum of a resolution of that society, passed at its annual meeting, recording "their admiration of the zeal and perseverance with which he has deduced the mean pressure and temperature of the atmosphere, and the quantity of rain for each month and for the whole year; with the prevailing direction and force of the wind at different seasons in this neighborhood, from a series of more than two hundred thousand observations, from the end of the year 1793 to the beginning of 1844, being a period of half a century." Dalton received the resolution sitting, and being unable to articulate a reply, handed a written one, which he had prepared, to his old and attached friend, Peter Clare, Esq., who read as follows:—"I feel gratified by this testimony of kind regard offered to me by my old associates of the Literary and Philosophical Society of Manchester. At my age, and under my infirmities, I can only thank you for this manifestation of sentiments which I heartily reciprocate."

This was the 19th of the month; on the 27th, Dalton was no more!

On Friday, the 26th of July, he retired to his room about a quarter or twenty minutes after nine o'clock; and going to his desk, on which were usually placed the books in which he recorded his meteorological observations, he entered therein the state of the barometer, thermometer, &c., at nine o'clock; and added, in the column for remarks, the words "little rain," denoting that but little had fallen during the day. His servant observed that his hand trembled more than he had ever before seen it, and that he could scarcely hold the pen. Indeed, the book exhibits, in its tremulous characters and blotted figures, striking proofs of the rapid decay of the physical powers. But there was the same care and corrective watchfulness as ever manifested in this his last stroke of the pen; for, having written opposite a previous observation, "little rain this," he now noticed that the sentence was incomplete, and added the word "day," which was the last word that was traced by his tremulous pen. He retired to bed about half-past nine, and spent a restless and uneasy night, but seemed, on the whole, in his usual way when his servant left his bedside at six o'clock next morning.

About half-an-hour later, his housekeeper found him in a state of insensibility, and before medical attendance could be procured, though it was immediately sent for, he expired, "passing away without a struggle or a groan, and imperceptibly, as an infant sinks into sleep."

The news of Dalton's death, although it must have been looked for by many, was heard with sorrow throughout the whole length and breadth of the land. His townsmen, anxious to express their sense of the irreparable loss they had sustained, resolved to give him a public funeral. But this was not enough; and as an additional mark of respect, his body was "laid in state" for a day in the Manchester town-hall, and visited by about forty thousand persons. The funeral itself took place on the 12th of August. "A procession was formed of nearly a hundred carriages, and many hundred persons on foot; the windows were lined with spectators, as well as the roofs of the houses; nearly all the shops and warehouses in the line of the procession, and many in other parts of the town, were closed; four hundred of the police were on duty, each with an emblem of mourning;

and the funeral train was about three quarters of a mile in length." He was buried in the cemetery at Ardwick Green. It has been felt by many that it would have been well if the "lying in state" at least had been omitted. It lessens the pleasure also with which we otherwise read the accounts of Dalton's burial, to know that the mode adopted in this respect to do honor to his memory was a source of pain and offence to the members of that estimable religious body with which the deceased had always retained connexion. Who were to blame, if the thing is to be accounted as blame-worthy, for this ceremonial, we shall not stop to inquire. It is quite certain that the people of Manchester generally were actuated by no other feeling than that of an earnest desire to honor the illustrious dead: and there is something solemn and sublime in the idea of the intelligent thousands of a great city, forgetting for a time the claims of business, attiring themselves in the weeds of woe, and gathering round the bier of a solitary scientific recluse like Dalton. This feeling is heightened by the thought that it was no questionable hero, no noisy demagogue or destroyer of his species, to whom the multitudes were doing homage, but a true high-priest of nature, and a benefactor of his fellow-men.

In stature, Dalton was about the middle size, of strong rather than of elegant proportions. The likeness between his head and face and those of Newton was often observed during his lifetime, and is said to have become more striking after death. When engaged in study, a certain air of severity, such as may be seen on the busts of Newton, shadowed his features; but the gentle smile on his lips showed even the inexperienced physiognomist that it was deep thought, not angry passion, that wrinkled his brow.

Till his seventieth year he enjoyed robust health, and he was all his lifetime fond of exercise in the open air. He made a yearly journey to his native mountains of Cumberland and Westmoreland, and climbed Helvellyn, and often also Skiddaw. The afternoon of every Thursday he spent at a bowling-green, where he could join with some congenial associates in a turn at the old English game of bowls. We have heard a distinguished professor of chemistry tell that he once called for Dalton at his laboratory on a Thursday, and was directed to look for him at the bowling-green. Dalton quietly apologized for being out of his laboratory, adding that he liked to take a Saturday in the middle of the week. He was entitled to do so, as he did not take one at the end, the seventh day being always a day of hard labor with him.

We have already alluded to a peculiarity in Dalton's vision, which he made the subject of the first paper he read to the Manchester Society in 1794. It consisted in this, that whereas most persons see seven colors in the solar spectrum, he saw only two—yellow and blue; or at most three—yellow, blue, and purple. He saw no difference between red and green, so that he thought "the face of a laurel leaf a good match to a stick of red sealing-wax; and the back of the leaf answers to the lighter red of wafers." When Professor Whewell asked him what he would compare his scarlet doctor's gown to, he pointed to the leaves of the trees around them. Dalton found nearly twenty persons possessed of the same peculiarity of vision as himself. The celebrated metaphysician, Dugald Stewart, was one of them, and could not distinguish a crimson fruit like the Siberian crab from

the leaves of the tree on which it grew, otherwise than by the difference in its form.

This failure to perceive certain colors is by no means rare, and has excited a great deal of attention. The continental philosophers have named it *Daltonism*, a name which has been strongly objected to by almost every English writer who has discussed the subject, on the ground of the inexpediency and undesirableness of immortalizing the imperfections or personal peculiarities of celebrated men by titles of this kind. If this system of name-giving were once commenced, it is difficult to see where it would end. The possession of a stutter would be called Demosthenism; that of a crooked spine, Esopism; the lack of an arm, Nelsonism; and so on, till posterity would come to connect the names of our celebrated men, not with their superior gifts, or accomplishments, or achievements, but with the personal defects which distinguish them from their more favored fellows.

Professor Whewell sought to better the matter by naming those circumstanced like Dalton, *Idiopts*, from two Greek words, signifying peculiarity of vision. But to this name it was justly objected by Sir David Brewster, that the important consonant *p* would be very apt to be omitted in hasty pronunciation, and so the last state of the Idiopt be worse than the first. Others have suggested various terms of Greek derivation, such as *parachrometism*, none of which, however, are sufficiently distinctive. The name "Color-Blindness," proposed by Sir D. Brewster, seems in every respect unexceptionable.*

We are more concerned to know that Dalton supposed the peculiarity of his vision to depend upon the vitreous humor, (the liquid which fills up the greater part of the ball of the eye,) being in his case of a blue color, instead of colorless, like water, as it is in the eyes of those who distinguish every tint. His own words are—"It appears, therefore, almost beyond a doubt, that one of the humors of my eyes, and of the eyes of my fellows, is a colored medium, probably some modification of blue. I suppose it must be the vitreous humor; otherwise I apprehend it might be discovered by inspection, which has not been done." †

After Dalton's death, in obedience to his own instructions, his eyes were examined by his medical attendant, Mr. Ransome. The vitreous humor was not found, however, to present any blue tinge, but, on the other hand, was of a pale yellow color: neither did red and green objects looked at, through it, used as a lens, present any difference in tint to an ordinary eye, as they should have done had Dalton's hypothesis proved true. Were his view, indeed, the correct one, blue spectacles should induce the same peculiarity in the eyes of every one, which they are well known not to do. Everything, in truth, points to the cause of the color-blindness, residing not in the optical apparatus of the eye, but in some peculiar condition of the brain or sensorium. So much for the physique of Dalton.

In endeavoring to form a conception of his mental peculiarities, we shall be assisted by comparing him with some of his great fellow-chemists. The laborers to whom chemistry has been indebted for

* The reader who is curious in regard to this matter, will find a very elaborate article on the subject, entitled "On Daltonism, or Color-Blindness," in the "Scientific Memoirs," an occasional periodical published by Richard Taylor, Red Lion Court, Fleet-street, London.

† Manchester Memoirs for 1793, p. 43.

its greatest advances admit of a natural division into two great classes. The one of these and by far the smaller, contains men possessed of enthusiastic, imaginative, poetical temperaments, of sanguine, hopeful spirits, and great rapidity, subtlety and comprehensiveness of mind. Such preëminently was Davy; such is the great living chemist Liebig; and if we accept a very subtle fancy instead of a far-stretching imagination, such too was Priestley.

The other and larger class consists of men in whom the poetical element was at a minimum, who were characterized by great patience, self-concentration, and perseverance in thinking; for whom the working motto was, "Non vi sed sæpe cadendo;" and in whom great self-possession and self-reliance were strongly developed, producing indifference to the opinion of others, and, in extreme cases, an almost repulsive hardness, sternness, and severity of character.

To this class belong Black, Cavendish, Wollaston, Bergmann, Scheele, Lavoisier, Dalton, and, if we include the living, and confine ourselves to our own country, Faraday, Graham, and Thomson. Thinkers of both these classes have done, and will yet do, excellent service to chemistry. We sum up their peculiarities in a word, if we say, with the late Dr. Henry, that the great object of the first class is to discover truth; of the second, to avoid error.

Dalton possessed, in an eminent degree, the characteristics of the class to which he belonged. He was so indifferent to the opinion of others, that he could never be persuaded to reply to the attempts which at one time were made to exalt Higgins above him; so self-reliant that, in the face of overwhelming evidence, he refused for a long time to put faith in Gaylussac's discoveries concerning combination by volume, because they contradicted a hypothesis of his own. To the end of his days he persisted in calling the atomic weight of oxygen 7, though all other chemists were unanimous in making it 8.

Like Newton, he referred the discoveries he had made, not to the power of genius, but to the industry which he had brought to bear upon their elucidation. At the anniversary meeting of the Pine-street Medical School, Manchester, he thus replied to a toast embodying his name:—"With regard to myself, I shall only say, seeing so many gentlemen present who are pursuing their studies, that if I have succeeded better than many who surround me, in the different walks of life, it has been chiefly, nay, I may say almost solely, from unwearied assiduity. It is not so much from any superior genius that one man possesses over another, but more from attention to study and perseverance in the objects before them, that some men rise to greater eminence than others. This it is, in my opinion, that makes one man succeed better than another. That is all I shall say concerning myself." In all this there was no affectation. One who knew Dalton well, said of him during his life, "If led into a discussion on any branch of science or philosophy with which his name is connected, he never hesitates to explain where his own discoveries begin and end, and what portion of the ground has been trodden by others." Neither did he hesitate to entitle his volumes on heat and atomics, "*New System of Chemical Philosophy.*"

He was very methodical and orderly in his habits. We have seen that the Thursday after-

noon was spent in the bowling-green. He was equally regular in attending the meetings of the Society of Friends, at which he was present twice every Sunday. On the same day, he was in the habit, for more than forty years, of dining at a friend's house; and even when the family were absent, he paid his accustomed visit.

His love for truth was very great, of which one striking example may be given. A student, who had missed one lecture of a course, applied to him for a certificate of full attendance. Dalton, at first, declined to give it; but, after thinking a little, replied—"If thou wilt come to-morrow, I will go over the lecture thou hast missed."

Such was Dalton; a simple, frugal, strictly honest, and truthful man. For the independence, gravity and reserve of his character, he was, doubtless, much indebted to his birth as a Cumberland yeoman, and his long connexion with the Society of Friends. The individuality of his nature showed itself in his great mathematical capacity, his thorough self-reliance and power of patient, persevering work, the native clearness of his intellectual perception, and the extraordinary power of fearless generalization which he brought to bear upon what nature unfolded to him. In the latter quality, in particular, he excelled every one of his scientific contemporaries.

The inhabitants of Manchester have announced their intention of erecting a monument to Dalton's memory. We trust that the proposition of founding a chair of chemistry, especially for the exposition of chemical atomics, will take the precedence of every other, as the best means of carrying out that intention. Every one, we think, must feel that bronze statues, or other costly erections, would be altogether out of keeping with the character of the plain Quaker man of science. A "Dalton" chair of chemistry, on the other hand, would be a fitting memorial, and in conformity with the wishes of him whom it is intended to honor. Dalton, it is well known, left the sum of 2000*l.* to endow such a chair at Oxford, but revoked it before his death, with the view, it is believed, of giving the money to friends, who had assisted him in his early days.

We would hint, moreover, that even the enduring brass and the everlasting granite crumble down under the tooth of Time, and are, at best, but dumb remembrancers of him whom they seek to save from oblivion. The living voice of the professor from his chair, would keep in perpetual remembrance the name of Dalton, as the paid and appointed chantings and masses of the Roman-catholic priest recall, if but for a moment, the memory of the long-forgotten dead.

We offer these suggestions, with all deference, to those who seek, by some befitting token, to keep before us the memory of Dalton, because we should grieve to think that a great sum of money had been spent for this purpose in vain. So far as he himself is concerned, we have no fear. Dalton will never be forgotten. He is the second Newton of English physics, and will go down to posterity along with the first. Men will think of them together, and compare them to the double stars which a later astronomer has unfolded to our view—each a sun, shedding light on the other; both stars of the first magnitude, revolving round, and pointing towards a great centre, which they equally make manifest and obey: even Him who is the first and the last, the Alpha and the Omega, the beginning and the end of all things.

From Chambers' Journal.

THE FESTIVAL AND ITS CONSEQUENCES.

A SCENE IN NAVARRE.

It was a fine afternoon in the spring of 1834; the birds were cheerfully singing on the trees, the flocks and herds contentedly cropping the young herbage, and the air was perfumed with odors. Not only did the face of nature brightly smile, but some festive ceremony was evidently about to be performed in the village of —, in Navarre. Numbers of young girls were seated at the cottage doors, weaving garlands of spring flowers, whilst several youths looked on and encouraged them. Here and there an old man, wrapped in a rusty-brown cloak almost as ancient as himself, stood observing the juvenile groups; and on the threshold of a miserable hovel sat an aged woman singing a wild air, accompanied by uncouth gestures; but whether they betokened joy, grief, or anger, it would have been difficult for a stranger to determine.

At length the damsels rose, each bearing in her hand the blooming wreath she had entwined, and the whole party proceeded to a small *plaza*, or square, in front of the church, where, waving their chaplets gracefully, they danced to the sound of a large tamborine and the mountain-pipe, called the *gaceta*, the tones of which strongly resemble those of the bag-pipes. Nor was the human voice wanting: the harsh and discordant chant of the beldame was again heard; and by her side a lean rickety boy, of about fourteen, with wiry flaxen hair, imbecile look, and unmeaning grin, beat time by clapping his hands. The dancers became more and more animated every moment; the fine hair of the young women, which had hitherto been plaited and arranged with natural good taste, was, by some sudden process, allowed to fall loosely on their shoulders; and at the same moment each maiden placed a chaplet on her head, the young men slinging larger garlands across their breasts, like the broad ribbons of chivalric orders.

At the conclusion of the dance, the great gates of the church were thrown open; at the eastern end the altar, resplendent from the effect of numerous large wax candles, had an imposing appearance. The cura, or priest, habited in richly-embroidered vestments, stood under the portico, and spreading forth his hands, bestowed a blessing on the people, who knelt reverentially to receive it.

While this act of devotion was in progress, a loud creaking sound was heard, and presently a small body of men appeared advancing along the road which runs close by the square. Their heads were covered with the flat cap called *La Boina*; they wore coarse brown cloth jackets, and loose white linen trousers, their waists being encircled with broad red woollen sashes, below which, and in front, were strapped their cananas, or cartridge-pouches: instead of shoes they had *alpargatas*, or hempen sandals: they were armed with muskets; and bayonets without scabbards were stuck in their belts. This vanguard was followed by four wains, each drawn by two oxen, guided by a peasant bearing a long staff, with a goad at one end. The oxen moved very slowly, the creaking sound being produced by the evolutions of the heavy wooden axle-trees of the wains, which were followed by a much larger party, clothed and armed in the same manner as that in advance, the

whole being commanded by an officer in uniform. Three of the bullock-cars contained each a new bronze mortar of moderate size; the fourth was laden with ammunition-boxes. On their arrival in the plaza, the escort uncovered their heads, knelt, and received the priest's benediction. The assemblage then rose; the tamborine and mountain-pipe struck up; the old woman resumed her discordant song; the half-witted urchin clapped his lean hands more vehemently than ever; the young men and maidens moved towards the wains with a solemn dancing step; and, finally, the girls decorated the horns and necks of the oxen with the wreaths they had been gracefully waving during the dance; whilst the youths encircled the mortars with the larger garlands; the whole ceremony being performed with the utmost enthusiasm.

Meanwhile, the priest had retired to the interior of the church; but when all the arrangements were completed—the oxen adorned with their glowing honors, standing patiently in the sun, and the murderous bronze artillery decked with sweet and peaceful flowers—he again came forth, preceded by a youthful acolyte carrying a large silver cross, elevated on a staff apparently of the same metal. By his side was another boy wearing a scarlet cassock, over which was a white muslin tunic; he bore a silver censer, which, when this little procession had reached the wains, he threw up into the air, and then drew it back again by its silver chain, making the white smoke of the incense cloud over the mortars, and around the heads of the oxen, after which the priest sprinkled them with holy water. The instant this ceremony was completed, there was a general shouting of "*Viva Carlos Quinto! Viva la Religion! Success to the new mortars! Death to the Christians!*" Amidst these fervent cheers the bullock-cars moved on, escorted as before; the young men accompanying them as a guard of honor a little way beyond the limits of the village. On parting, the soldiers cried—"To Elizondo! to Elizondo!" and soon entering a mountain gorge, they disappeared.

The day after this scene there was considerable agitation in the village. Several fathers of families, who had been absent acting as scouts, attached to Don Carlos' army, or otherwise connected with it, returned. They brought accounts of the retreat of the Carlist chief, Zumalacarraguy, from before Elizondo; and it was whispered that the mortars which had passed through on the previous day, and had been welcomed with so much pomp, were on their way back. The confusion occasioned by these reports was at its height when a stranger, covered with dust, rushed into the plaza, with breathless haste. He was a fine well-made man of about thirty; his features, though handsome, bore a strong stamp of cunning; and the expression of his large gray eyes, set in a face the color of which was only a shade removed from black, was so peculiar, as to render it painful to meet their gaze. The stranger's costume was unlike that of the Navarrese peasants. He wore a jacket of dark blue velvet, open, displaying a waistcoat of the same material, adorned with three rows of large open-worked silver buttons, hanging loosely; his breeches were of coarse dark cloth, with silver buttons down the outer seams; he also wore a blue worsted sash, and hempen sandals. Round his head was a cotton handkerchief of bright and variegated colors, tied behind, with two long ends hanging down; above

the handkerchief appeared a cone-shaped black beaver hat, with a narrow brim turned up all round; the front of the hat was ornamented with three tarnished tinsel stars—green, ruby, and yellow—stuck on a strip of rusty black velvet. His thick neck was bare, and from constant exposure to the sun and weather, as dark as his face. He was a *gitano*, or gipsy.

"I am sent by Zumalacarrégu," said this man, "to tell you that the mortars are on their way back, and that they must be concealed in this neighborhood; all, therefore, must unite in conveying them to a place of safety. The general's orders are, that every man proceed instantly to meet them; they must not reënter the village; your privileges, your lives even, depend on promptitude and energy; the *holy* guns must be placed in security."

This appeal met with a ready echo in the breast of every hearer; for the whole population of the village had identified themselves with the fate of the consecrated artillery. All the men immediately sallied forth with Zumalacarrégu's messenger. They had not proceeded far along the road, before the well-known creaking of the bullock-cars indicated that the objects they had set forth to meet were approaching; they soon appeared, bereft, however, of their gay adornments.

The gitano immediately addressed himself to the officer in command of the escort: and after a brief parley, three of the village elders were summoned to join in the consultation. Much animated discourse ensued, accompanied by that lively gesticulation by which the Spaniards are characterized. The result was, that the wains were drawn along a by-road to a field, under the guidance of the villagers, the gipsy and the escort following. On arriving at the centre of the field, the oxen were taken out of the wains, which, being tilted up, the mortars glided easily to the ground. The peasants had brought with them the large hoes used by the husbandmen of Navarre, and having dug trenches of about three feet deep, the mortars, which only the day before were adorned with garlands, and sent with shouts and vivas to be employed against the Christians, were now buried in the earth in solemn silence.

The oxen were again yoked to the wains, and led to the high road, whence they departed in an opposite direction: the escort took the shortest route to the mountains, and the villagers hastened to regain their homes. The gipsy proceeded to the residence of the cura, with whom he was closeted for some time: he then went to the small venta, or village inn. After his departure, the alcalde was summoned to attend the cura: they held a long conference, at the conclusion whereof the alcalde visited every house, and made a communication of solemn import to its inmates.

Towards evening several little groups were assembled in the plaza, and before the house doors. They conversed energetically, and, on separating at nightfall, their countenances and manner indicated that a definitive and decided resolution had been universally adopted upon some highly interesting and important matter.

The following morning, just as the mists were clearing away from the summits of the neighboring mountains, General Mina entered the village, having marched during the greater part of the night. He had previously caused the place to be surrounded by his troops, in order to prevent the escape of any of the inhabitants. Attended by

his staff, he rode to the plaza, whither the whole population were summoned by the crazy drum and drawing voice of the *prégonero*, or public crier.

The people who only two days before had hastened to the same spot with dancing step and exulting eye, cheered by the tamborine and mountain pipe, now crept one by one out of their dwellings with fearfully-anxious looks, and wended their unwilling way towards the plaza.

Mina eyed them sharply as they emerged from the narrow avenues; but his weather-beaten face did not betray any inward emotion. By his side stood the cura, dressed in a rusty-black cassock, holding between both hands his oblong shovel-hat; and pressing its sides within the smallest possible compass. His countenance was ghastly, and his small jet-black eyes peered from beneath their half-closed lids, first at the villagers as they glided into the plaza, and then askance at the general, who had already questioned him closely with regard to the mortars, which he had been assured the villagers had voluntarily assisted in attempting to convey to Elizondo—then in possession of the queen's forces, and fortified—for the purpose of bombarding it. He had also heard of the ceremony of decorating and rejoicing over the mortars, and of their subsequent concealment, with the connivance and aid of the cura's parishioners.

The priest, however, pretended to be totally ignorant of the matter. "Senor General," he said, "the cura of — will never sanction rebellion against his rightful sovereign."

As soon as these words had escaped his lips, a loud clapping of hands was heard immediately behind him. Upon turning round, the cura perceived the idiot lad, who laughed in his face, and trailed his half-dislocated legs along, in grotesque imitation of dancing. The cura looked affrighted; the muscles of his visage became suddenly contracted; and his eyes flashed fire upon the urchin whose noisy movements seemed to strike terror into his soul.

The plaza was now crowded with men, women, and children; shortly afterwards an aid-de-camp appeared, followed by an officer's guard. The former approached the general, and reported that, in pursuance of his orders, every house had been searched, and that, to the best of his knowledge, all the male inhabitants who remained in the village were now present.

"Let them be separated from the women and children," said the general.

This order was promptly executed, the men being drawn up in a line before Mina. It was a strange, an anxious scene: the elderly men stood, like ancient Romans, with their cloaks thrown about them in every variety of picturesque drapery; some of their younger companions were dressed in brown woollen jackets, their snow-white shirt collars falling on their shoulders; others in short blue smock-frocks, confined round the waist by broad girdles of bright mixed colors. All wore the picturesque boina, but of varied hues—blue, white, or red.

The women and children formed a gloomy background to this singular picture: they were far more numerous than the men, one or more of every family having joined the Carlist party. The young girls, who only forty-eight hours before had been weaving chaplets with so much glee and energy, now stood motionless, some looking fixedly in Mina, others, their hands clasped, and their beautiful eyes raised towards heaven, appeared

absorbed in prayer. The old woman, crouched on the ground, plied her knitting-needles with great diligence; her lips moved rapidly, but no sound escaped from them; and she had so placed herself as to be able to peer through the slight separation between two of the men who stood before her.

Mina now advanced a few paces in front of his staff-officers, and thus addressed the villagers:—

"I know that, two days ago, three mortars passed through your village on their way to Elizondo, and that, yesterday, they were brought back. I also know that they have been concealed in this vicinity with the knowledge of the inhabitants: where are they?"

Not a syllable was uttered in reply.

"Where are the guns!" cried Mina, with a loud voice and irritated manner—"the mortars you decorated with garlands, because you supposed they were shortly to be used against the queen's forces!"

The people continued silent.

Whilst this was going on—the eyes of the staff-officers and the troops being all fixed on the general and the villagers—the cura had managed to glide into a narrow alley by the side of the church, (at the back of which, by a strange oversight, no sentinel had been placed,) then darting down a lane, he crossed a rivulet at the end, and plunged into a dell covered with brushwood; thence, through paths well known to him, he bent his course towards a small town about a league off, where he knew there was a Carlist garrison.

Mina, finding he could not make any impression on the determined people before him, turned sharply round with the intention of commanding the cura to use his influence to induce them to give him the information he required; not seeing him, he said, "Where is the cura? Search the church!—search his house!"

In the former there was not a living being; and at the latter only the ama, or housekeeper, a good-looking young woman, who declared that she had not seen his reverence since he was summoned to the general's presence early in the morning.

This being reported to Mina, he shrugged his shoulders, and proceeded once more to harangue the multitude:—"Well," he said, "you appear resolved to refuse giving me the information I ask for: now, listen to the voice of Mina, who never promises nor threatens in vain. If, in one quarter of an hour by this watch, (drawing it from his pocket,) the place where the Carlist mortars are hidden be not divulged, I will decimate the men now before me. Every tenth man shall be instantly shot: decide for yourselves."

It was a fearful quarter of an hour. Each man was joined by a female—a mother, wife, sister, or one to whom his heart was devoted: the only individual unnoticed by any of the women was the gipsy. He was a stranger in the village, and belonged to a race for which there was no sympathy on the part of the Navarrese, although its members were at that early period of the civil war employed on important missions by the Carlist chieftains. He stood alone with his arms folded, and was apparently in a state of abstraction.

The drum was beat—the quarter of an hour had elapsed: the soldiers again began to separate the men from the women. In the confusion, the idiot boy crept up to the gipsy, and roused him from his reverie by saying in a half-whisper, "Ho,

Senor Gitano! stand last on the line, and you are safe."

The stranger looked intently for an instant at the lad, who rubbed the palms of his hands together, and glanced confidently towards the extremity of the line of men now almost formed. The gipsy contrived to place himself the last.

Silence having been commanded and obtained, Mina said, "This is the last moment—confession or decimation." No answer, no sign.

"Sergeant, do your duty," said the general.

Immediately a non-commissioned officer began counting along the line. On arriving at the tenth man, he was made to stand forth. The sergeant then went on reckoning in like manner. Four more were thus selected. The sergeant recommenced counting. There were but nine left, the gipsy being the ninth. The rank was closed up again, and the five men were left standing about a yard in front of the others. An officer and eight soldiers now marched into the centre of the plaza; and the villager, who had the unenviable precedence in this mournful selection, was led to the general, who thus addressed him: "Reveal the hiding-place, and you are safe. I should rejoice if your life could be spared."

"Senor," replied the prisoner, a fine young man, "I know it not."

Mina rode to the front of the line of villagers and said, "Will any of you confess, and save this youth?"

"The mortars did not pass through the village on their return," cried the men.

Mina then rode to the rear, and questioned the women.

"General, general," they all shrieked together, "we know nothing of the mortars. Spare him, spare him; be merciful, for the love of God!"

This reply—this appeal for mercy—had scarcely been sent forth, ere a young and beautiful woman rushed from the group, and falling on her knees before Mina, exclaimed in imploring accents, "Spare, oh spare my brother! He was all yesterday in the mountains cutting wood, and did not return till after nightfall."

"There is no remedy," replied Mina, "unless the secret be disclosed."

Five minutes after Mina's return to the spot where his staff were assembled, the young man was led to the wall of a house fronting the plaza; his arms were pinioned, and a handkerchief was tied over his face. He was then shot dead by four soldiers, who all fired at one and the same instant. Three more shared a similar fate, after every endeavor to induce them or the other villagers to give information concerning the mortars. They all met their fate with heroic calmness and dignity. The fifth was an old man. His anxious eyes had followed each of his fellow-captives to the death-station. His own turn was now at hand. There lay the bleeding corpses of his young companions, and he was interrogated as they had been previously to their execution. "I call God to witness," cried the aged man, "that I know nothing of the matter. I confess to having been present when the mortars passed through on their way to Elizondo, but I was not here when they were brought back."

"'Tis true, 'tis true," shouted the people, forgetting in the fearful excitement of the moment, that they were condemning themselves by this declaration.

"Then save his life by confessing," answered Mina.

"We have nought to confess; Francisco is innocent," was the universal reply, to which succeeded a sepulchral silence.

As the old man was being conducted towards the wall where lay the four-dead bodies, he passed close to Mina's horse; and at the moment when his arms were about to be tied behind him by two soldiers, he broke from them, and casting himself on his knees, clasped the general's thigh with both his shrivelled hands, crying, "For the love of the Holy Virgin, spare me, spare me! Oh! by the affection you bore your own father, save the life of an aged parent! I never saw the mortars after they left the village the first day."

Mina moved not; his face appeared as though it had been chiselled out of a block of brown stone. The two soldiers in vain endeavored to loosen the old man's hands from Mina's thigh; he clung to, and grasped it with all the strength of desperation. At length, however, by dint of repeated efforts, he was removed, and having been taken in a state of exhaustion to the fatal wall, he speedily fell, pierced by the deadly bullets.

After this awful execution, Mina said, in a loud voice, "Now let the last man in the line be brought forward."

Mina had observed, immediately after the old villager had been shot, that an interchange of glances full of meaning took place between the gipsy and the half-witted boy; and surmised, all at once, that the stranger might be influenced by the fear of death to divulge the secret.

On hearing the order for his being brought forward, the gitano's swarthy complexion assumed a deep yellow tinge, and he trembled from head to foot. "You have but five minutes to live unless the mortars be found," said Mina, addressing the gitano.

The moral construction of the gipsy was of a very different nature to that of the peasantry of the northern provinces of Spain, although he had been a zealous hired agent of the Carlist junta in stirring up the people to the pitch of enthusiasm to which the Navarrese had been wrought at that period, under the idea that all their rights, privileges, and religious observances were at stake, and could only be secured by the annihilation of the Christians. He had expected to escape by means of the position in which he had contrived to place himself on the line of villagers, and had therefore remained silent during the previous interrogations; but now, finding that the very manœuvres he had put in practice to save his life had, on the contrary, brought him to the verge of destruction, he lost all command over himself. In tremulous accents he begged permission to speak privately to the general. He was led, tottering from fright, to the side of his horse. Mina was obliged to stoop to listen to his almost inaudible whisper, rendered doubly indistinct by the chattering of his teeth. "Senor Mina, my general," he muttered, "If I divulge the secret, will you take me with you? Will you protect me from the vengeance of these villagers?"

"I will," answered Mina.

"Then—send a party of soldiers, with some pioneers, down the lane to the left of the church, and when they arrive at a spot where there are three evergreen oaks, let them turn into a field to the right; in the centre of it they will see a heap

of manure; let that be removed; then let them dig about three feet deep, and they will find the mortars."

Mina instantly gave orders to the above effect; and during the absence of the party—about half an hour—a solemn silence reigned in the plaza. The gitano stood close to Mina's horse with downcast eyes, though occasionally he glanced furtively at the villagers, who all regarded him with menacing gravity.

At length a sergeant arrived from the exploring party, and informed Mina that the mortars had been found. "Your life is spared," said the general to the trembling gipsy, "and your person shall be respected—you march with us."

It took the greater part of the day to get the mortars exhumed and placed in bullock-cars pressed from the inhabitants, who were also compelled to dig up the guns and hoist them into the wains, the owners of which were forced to guide the oxen, under a strong guard.

The foregoing narrative, the leading features of which are traced from facts, displays the indomitable spirit of the Navarrese peasantry. Heart-rending it is to reflect upon the frightful evils of civil war, which none can fully conceive but those who have been eye-witnesses of them.

THE UNITED STATES.

BY JOHN KEBLE.*

TYPE of the farther West! be thou too warned,
Whose eagle wings thine own green world o'er-
spread,

Touching two oceans; wherefore hast thou scorned
Thy father's God, O proud and full of bread!
Why lies the cross unhonored on thy ground,
While in mid-air thy stars and arrows flaunt?
That sheaf of darts, will it not fall unbound,
Except, disrobed of thy vain earthly vaunt,
Thou bring it to the blessed, where saints and
angels haunt!

The holy seed, by Heaven's peculiar grace,
Is rooted here and there in thy dark woods;
But many a rank weed round it grows apace,
And Mammon builds beside thy mighty floods,
O'ertopping Nature, braving Nature's God;
Oh, while thou yet hast room, fair, fruitful land,
Ere war and want have stained thy virgin sod,
Mark thee a place on high, a glorious stand,
Whence Truth her sign may make o'er forests,
lake and strand.

Eastward, this hour, perchance thou turns't thine
ear,

Listening if haply with the surging sea,
Blend sounds of ruin from a land once dear
To Heaven. O trying hour for thee!
Tyre mock'd when Salem fell! Where now is
Tyre?

Heaven was against her. Nations, thick as waves,
Burst o'er her walls, to ocean doomed and fire;
And now her tideless water idly laves
Her towers, and lone sands heap her crowned
merchants' graves.

From the Edinburgh Tales.

YOUNG MRS. ROBERTS' THREE CHRISTMAS DINNERS.

CHAPTER I.

THOUGH an old bachelor myself, I have always had a fancy for visiting new-married people. I cannot, however, pretend that I have been able to approve of above half the unions my young friends are pleased to form. Yet I am so little of a Malthusian philosopher as never to have been able to comprehend how Jerry Jenkins is to be dissuaded from intermarrying with his beloved Jeany Jones, because their remote posterity may chance to add an inconvenient fraction to the living thirty millions of the British Isles, and probably become a burden, at some time or other, on the parishes of *De-la-mere-cum-Diss*. But whether I approved the marriage or not, where I liked the parties, and the deed was done, I have always found it pleasant to visit them, as soon as the first blush of the affair was over, and the sober household-moon rising over, whether that of pure honey, or of treacle and butter. I like to look upon the first home, however humble, in which the young bride has shrined so many fond hopes; and to witness the effects of the heart-taught taste which has adorned her bower in the brick-and-mortar wilderness. Then there are to be seen the little tokens of the affection and good-will of distant friends, which surround her like tributes and trophies. There is, too, the indescribable flutter of a vanity, now first divided between her own pretty person, decked in its bridal garniture, and her pretty sofas and window curtains; both repressed by the matronly dignity of a woman to whom belongs, of sole right, a certain number of silver spoons, and china cups and saucers, and the whole consolidated by the awful responsibility of her who bears three small *keys of office* upon a steel or silver ring, and has a six inch account book, "to chronicle small beer," locked in a new rosewood eighteen-inch writing desk—and who, you see by her face, nobly resolves to do her *duty*, as becomes a married woman, who has the responsibility of laying out money, and of keeping house for herself and another, who may never yet have taken her capacity for domestic management into much account. There may be, nay, there are, many giddy-headed, shallow-hearted creatures, who feel all the vanity, with none of the tremendous responsibility of this condition. My business, at present, is not with them.

It was my good fortune, in 1820, to pay my devoirs to three newly married women, on one frosty October morning; one of them in humble life, the two others in what is called the middle rank of society. Of these marriages I had heartily approved one—that of my friend Joseph Green; while I was doubtful of Mr. George Roberts' matrimony, and had openly disapproved, and, so far as my advice went, opposed the wedding of Sally Owen. This Welsh girl was educated in a public charity; and, from ten years old to eighteen, lived, first as an apprentice, and then a voluntary servant, under the same roof with myself, enjoying in her early discipline the vigilant superintendance of notable Nurse Wilks. From our abode she went into a better, that is to say, a more lucrative service; but our house she considered her home—her rendezvous on her *Sunday-out*, and in all seasons of trial and difficulty. While with

us, Sally was chiefly noticeable as a well-tempered, industrious girl, who cheerily scrubbed and dusted all day, and sang like a lark, "*Far beyond the Mountains*," and other Welsh airs. In her new service she became more prudent and less girlish, which increased my concern when she came formally to announce her marriage. No folly that girls like her can possibly commit in the way of matrimony, will ever excite my surprise. Her intended husband was a boot-closer. He could make his couple of guineas a-week, *if he liked to keep steady*; and needed never be out of employment, *if he chose to work*. *Its* and *but*s spoil many a good charter; and it proved so with Sally Owen, who wept all night over my warnings and Nurse Wilks' scolding prophecies, and married in the morning in very tolerable spirits.

This was all past by two months or more, and I visited her tidy single room, not to hear more of her husband's faults, but much better pleased to listen to her shy praise of his kindness and *steadiness*; and that in one week he had earned fifty shillings!—and placed it in her hand. I hoped she would take care of it, and so, with good wishes embodying good advice, I left my compliments for Mr. Hardy, the extraordinary boot-closer, who could work miracles when he liked; and placed my gift of Franklin's *Life* on a little rack above Sally's drawers.

Joseph Green was a member of the Society of Friends. He was the eldest son of my old friend, Joseph Green the draper, to whose long-established business he had lately succeeded. About the same time a courtship, if such it might be called, of some three or four years' duration, had been brought to a close by Joseph marrying, with the full approbation of all concerned, the eldest daughter of a cloth manufacturer in Yorkshire, who, I need not say, was a member of the same society. The fair Quaker, I found endowed with a competent share of the comely and intelligent looks which distinguish the females of her beneficent sect. I was pleased with her manners, her conversation, her comfortable and well-arranged abode; pleased, but not yet particularly interested, nor in the least charmed. Perhaps I was too late of paying my marriage visit to this serenely sensible person, who, for aught that I saw, might have been married for seven years.

So far as human beings may dare to calculate on the course of human events, it was clear that this was to be a *soberly* happy couple, and theirs a flourishing household, established on the sure basis of prudence, mutual esteem, rational affection, competence of the means of a moderate life, perhaps a little romantic *love* also, though for this last I cannot swear; but certainly with a deep and holy sense of the duties and claims of the condition upon which they had deliberately entered, obtained by the discipline of a life, and enforced by the customs of their society, and the sanctions of their peculiar institutions. Chance had thrown my third bride into the next door of the neat row of new houses, one of which, while their house was building, formed the temporary abode of Joseph and Rachel Green. She was now the two months' wife of Mr. George Roberts, my brother's confidential clerk, whom I had known from a foolish boy—who had, indeed, grown up with and among us. He was now neither a fool nor a boy; he was, instead, a sensible and singularly acute fellow, above thirty: yet it had pleased him to fall in love, in the previous month of July,

with a very pretty young woman, a governess in a school at Hastings, to whom he had chanced to carry a letter, and whom he had seen afterwards at church, and met two or three times during his sea-side sojourn. My brother and his wife, to whom Roberts was more than an ordinary *attaché*, thought the thing a more "foolish affair" than they might have done some twenty years before; but Roberts had certainly a right to please himself—which he did, by marrying at Michaelmas, and laying out his savings, and probably a little more, in furnishing smartly the house next door, as I have said, to Joseph Green. He insisted that I should come to see, he did not exactly say to admire, *his* wife and *his* house; and I complied willingly. I had already seen her at a party given by my sister, in honor of "the foolish marriage." She was a lively, and almost a handsome, black-eyed girl, about twenty; and if not what ladies would allow to be fashionable-looking, she was at least showy and dressy; vain enough quite, and occasionally affected in her manners, though not yet wholly incrustated with either the scurf sugar-work or worse frost-work of an incurable affectation. Although the assumed fine *personage* would rise, and obtrusively come between one and the natural woman, it was not yet difficult to doff the shadow aside and come at the real substance.

Mrs. George Roberts, like, I fear, ten thousand others of my country-women, had married with little more knowledge of the duties of her new condition, than belonged to the marriage dresses, the cake and cards, her ring and its brilliant guard, at which she glanced fifty times by the hour, her bracelets and combs, and the other paraphernalia of her rank and state. Yet there was occasionally that about her, which did not bespeak a woman to whom nature had denied either heart or mind, and I hoped she had fallen into tolerably good hands.

In those digital acquirements, named accomplishments, young Mrs. Roberts was no mean proficient. She also read French, and a little Italian, and had a natural talent for music, and, moreover, an ill-toned, brass-mounted new cabinet piano-forte, which formed the principal ornament of the small drawing-room, into which I was ushered by a fluttering girl in a wedding cap and topknot. It was a temple worthy of the goddess: yet the general effect at this time, while everything wore the gloss and freshness of novelty, was airy, and, so to speak, tasteful—French, or Anglo-Gallican; and I suppressed the cynical idea, forced by an involuntary comparison of this apartment with Rachel Greene's roomy bed-chamber, on the other side of the party-wall—and the question, "How will all these *fimsies* look two years hence,—mistress included?" At present all was glittering, if not golden; and "brightly blue" muslin draperies, coarse gilding and lacker, and spider-limbed, crazy-jointed chairs and sofas—painted and varnished in imitation of expensive woods—made up the inventory, and—all obtained prodigious bargains!

"As we can't afford to give many dinner parties, it don't much signify for the dining-parlor" said George, with the prudent air so becoming in a young husband. "And as we have only a limited sum to lay out in furniture, we have made anything do for the family-room down stairs, to have this one nice for Maria's little parties."

"But where the deuce are you to sleep? This is your neighbor Greene's chamber through the wall there. Is your house larger?"

"Self-same every way; but the Greens have no drawing-room: there is a very good small attic chamber—What signifies where people sleep?"

"Then this is the *show-room*. It really looks pretty to-day,—*umph*."

"It was so good of Mr. Roberts to leave the decorating of this apartment to myself," said the bride. "I so love a bright, delicate, pale, but not too pale, blue." We all looked round us admiringly at chairs, and squabs, and pillows, all "beautifully, brightly blue," and at the flowered muslin curtains, bordered with blue, and at everything festooned with bunches of "bonny blue ribbons," even to Maria's dark hair. On her varnished work-table, with its blue silk bag, were blue bell-ropes, the twisting and twining of which formed her present employment. On other tables were volumes of neatly bound little books, and vases of artificial flowers, and cards of wedding guests; and the chimney-piece was profuse of "ladies' work," in its numerous conceits and flimsy varieties. But the most striking, and to me the most provoking part of the details, was the small portable grate, placed within a large bronzed and lackered one, in which smouldered and smoked a few small coal, contrasting dimly, on this chill, lowering day, with the clear-burning fire and cheerful fireside I had left in the next house. I am not yet done with these details. Upon the spider-legged work-table, which a puff of air might have overturned, lay the lady's cambric-laced pocket-handkerchief, bordered by her nicely-clean French gloves, which had been taken off, that she might prosecute the bell-pull industry; and on the handkerchief, a very pretty purse made of gold and purple twist, with a *rich* clasp and tassel; half sovereigns and sixpences glancing brightly through, ready to start forth, prompt to do the bests of the fair owner as long as they lasted. I had no right nor wish to be *sulky*, nor yet to anticipate evil. There was nothing positively wrong, though there might be indications of excess of right. There certainly was nothing irreclaimable, nothing that a year's *tear and wear* of life, with its attendant experience, might not rectify. My friend George was so evidently delighted and charmed with his wife, his house, his domestic happiness and good fortune, that I could not be otherwise. I could also see that the household virtues, with their concomitant vices, were budding already in the thoughtful heart of his bride.

I would have been content with something quieter this morning than the lilac silk frock, one of the principal bridal dresses, and my brother's present, put on to do me honor; but then the motive was so good. Mrs. Roberts was already half aware that frugality was a *virtue*, hence the *bad* fire—and industry a *duty*, hence the blue bell-roping, till the poor girl was herself blue with cold.

"You have been calling for our neighbor, Mrs. Greene," said Roberts.

"Is she so very pretty?" inquired the lady. "The Quaker ladies are all imagined so handsome; that odd dress of theirs attracts attention to their faces—yet I am sure it is not in the least becoming."

"Not in the least, only convenient, and *comfortable as clothing*. I wish their female costume were more elegant. But I beg pardon. My friend Joseph's wife is not very pretty. She looks the mild, intelligent, amiable young woman

which I am certain she is. Her face is very *English*, both in features, and in its serene beauty of expression—the real, not the *beau-ideal*, English beauty of modern artists."

"The Quakers are not musical, I believe?"

"No!—I am sorry they are not.—I do not mean exactly musical, that is now an odious hackneyed phrase; but that those whom Nature has attuned to the harmonies of sound, are not allowed to follow her bent. There can be no true wisdom in obliterating the gift of a fine ear, or a delicious voice, because it may sometimes be abused. Rachel Greene has a small bookcase in her chamber, where your piano-forte stands. I should like to see both where there is taste and leisure."

"They seem to have very nice furniture though; very *expensive* furniture," rejoined the lady. The subject had become of importance to the young housekeeper, with whom sofas and tables were fairly dividing empire with gowns and bonnets, and threatened to subvert their reign.

"Perhaps the Quakers think dear things cheap. They have excellent, substantial, and even handsome mahogany furniture in sufficient quantity. This *tasty* little drawing-room corresponds to their family chamber. They have no flowery muslin draperies—gilding or imitation work:—black hair-cloth chairs, and couches; and window curtains, and carpets of some warm color and substantial fabric—I cannot tell you what all they have."

"And they have no best room," cried Mrs. Roberts, glancing round with triumph on her arrangements.

"They have, and keep it for themselves," cried George laughing. "That is so like Broadbrim."

"I presume they may imagine themselves best entitled to the use of their own house. 'Greatest-happiness principle,'—hey George! Sleep in a dog-hole all the year round, to have a handsome apartment to receive one's pleasant idle friends, once a-month or so."

"One can't do without *one* apartment to keep neat for company. Roberts insists on making this our ordinary sitting-room; but as it is fitted up, that cannot *prudently* be."

I admired the emphasis, and did not despair of Mrs. Roberts yet comprehending the true import of the word graced with it. Another trifling incident I noted. Rachel Greene had herself taken from her small sideboard the glasses and bright silver salver required when the refreshment of cake and a glass of wine was offered me. She had but one servant-girl, who had come up with her from Yorkshire. Maria Roberts had exactly the same complement of domestic help; but the temporary bell-pull gave way, in sounding the alarm to the kitchen for the supply of our wants, to considerable bustle, misunderstanding, and delay occurred, before the gaudy japan equipage was forthcoming. When I took leave, Roberts bid me laughingly, that I must come often to see his wife. I had a foreboding that the lectures might be required sooner than he anticipated. The question with me was, did Mrs. Roberts seem a woman likely to profit by elder experience to league with her own; and as I saw no reason to despair of her, but in her energy, activity, and sweetness quite the reverse, I frequently repeated my visits, and always found her busily employed in one useless way or another.

The first grand marriage-dinner followed close

on the completion of the fittings-up, the covering of the ottoman with blue, and the suspension of the blue bell-ropes. I could not resist it. My brother's wife, with prudent consideration of a very small house, took only one daughter to represent the five who were to appear at tea. Mrs. Roberts had spared neither time, nor thought, nor labor. She had given her orders with spirit; and freely drawn upon the thrice-replenished gold and purple purse. The result was, everything considered, and fair allowance made, a very *genteel entertainment*. True, we were sadly crowded:—many things were forgotten, several lacked of the thousand-and-one requisites necessary to English *stylish* dinners; and there occurred numerous casualties. Several compulsory levies were made during dinner on the glass and plate stores of Rachel Greene. But, on the whole, though the thing did not work so well, where *hired* cook, *hired* footman, *hired* charwoman, *hired* everything, were strange and awkward, as where there is a well-drilled establishment, we got through the day, without affording materials to Theodore Hook for a piquant chapter on bourgeois pretension; leaving on the field of action three imitation rose-wood chairs dislocated, and two broken, many stains on the bright-blue furniture, compelled for the day to do parlor duty, with a large lot of cracked china and glass, and several plated forks reported missing.

"What's the good of Roberts giving such expensive, fine dinners?" said my ungrateful brother, (who had praised the venison to the skies, and been helped twice,) as we drove home. "His wife is but a child, poor thing, but he should have more sense. I must tell Master George this won't do."

My sister made her ordinary good-natured excuses. "It was the first entertainment—a marriage dinner; people must be like their neighbors."

"Well, well; all very good, Anne; but we shall see." What selfish, suspicious wretches prudent men in business are! James was already thinking of another clerk.

On my future calls upon Mrs. George Roberts, I found her always at work, busily employed, as if for daily bread, in embroidering caps and habit shirts, or altering and repairing her own dresses. One day, in the end of March, as I find by my diary, I visited Mrs. Roberts, after having called upon her neighbor, Rachel Greene. Indeed, I never went to see the one lady without calling for the other. Both appeared alike anxious to fulfil their duties; both were economical and *industrious*; but with how different an understanding of the domestic virtues! Maria Roberts was, beyond all doubt, the most laborious of these fair neighbors. By twelve o'clock, or earlier, any day that I called, I found Rachel, all the arrangements completed that took her to the kitchen, seated in her parlor with her *plain work*. All her work I found was what women called *plain work*: making or repairing useful garments—often of very ugly shapes—without seeming to consider that one kind of useful *seam* had greater pretensions to gentility or elegance than another. Her work was very often neighbored by a book; for, as she modestly told me, this year she had more reading leisure than she could in future look to have. At a regular hour she went abroad for her accustomed exercise, and generally brought home my friend Joseph to an early and comfortable dinner.

"How I envy my neighbor her walking and reading leisure!" said Maria, with whom I was now so intimate that she pursued her *ungenteel* work in my presence. "She looks always as if she had nothing to do—nothing to trouble her." The placid pair were passing, arm in arm, into their dwelling, accompanied by an elderly friend from the country, who had come on chance to share their family dinner.

"Why don't you make leisure? what are you always doing? Your family is exactly the size of Mrs. Greene's; your labors less in one way, for Rachel is a *martinet* about her house and furniture. She is making her new tables all looking-glasses. You tell me you have given up parties—what are you always doing?"

"Doing! Mr. Richard Taylor; I wish you knew the half of it: but gentlemen never do understand ladies' work. I wish school-girls only knew what married life is—with a small income—(a *sigh*.) I have not opened my instrument these six weeks; I have not looked into a book; indeed, I have given up the newspaper, it was so expensive, and such a waste of time, as Roberts sees it at his chambers. It is always *sew, sew, sewing*, as you see; but I don't repine at this. It is necessary that I should be industrious—and I rather like it." And she pinched, plaited, and held off, at arm's length, some part of the lilac silk dress which she was adapting to a new spring fashion, the garment having the misfortune to have been made in the extreme mode of the last October. I could perceive it was a tough job, and one which required both patience and affection for the work.

The flirtish form to coarse materials lent,
And one poor robe through fifty fashions sent.

How much of female time is consumed in this wretched way—time, valuable for health, for knowledge, for social enjoyment, for really productive labor, is thus wasted!

"Maria, when we obtain that nicely balanced constitution of king, ladies, and commons, of which we have so often talked, I hope Rachel Greene, representative of the women of this district, will bring in a bill, decreeing that when a dress is once made in the proper form, there it shall remain till worn out, or, at least, till it requires to be turned. I will have no remodelling, no adaptation to new style. How many mornings will this piece of gear cost you now?"

"Mornings! ay and evenings, Mr. Taylor,—four or five at the least, I assure you! If I have it finished before Easter Sunday, it is all I expect:" and she again turned it over, and plaited away.

"Fit preparation for that festival! Let us count the cost. Four or five long delightful walks in these bracing, invigorating spring mornings, exhilarating to health and spirits, even in London streets. A great many hours of pleasant, useful, or serious reading; storing knowledge for future days; ay, and several long evenings, in which you might have indulged your own taste, and that of your friends, with some very good music, which you can give them when you like—no lady better."

"It is hard!"—(a *sigh*)—"But you know I work from principle—from a sense of duty. I can't afford to pay a dressmaker."

"Fashion sew a lilac silk gown from principle!—Umph!"

"From a principle of economy, Mr. Richard!"—(peevishly)—"What can I do? I brought Roberts no fortune—I must be industrious." And the needle flew, while the color rose. How could I be displeased? I blamed my own severity, and gave her virtue the praise it merited; for here was the virtue of industry, however unenlightened and misdirected.

"Your good opinion, I am sure, is very flattering to me. Mr. Roberts has told me so much good of you; and I am so strange here and inexperienced, that I am most grateful for your advice. I have been so much benefited by your conversation and knowledge already. It was you first gave me the motive to industry, by showing me how expensive everything is in London."

"I am afraid I have blundered exceedingly, or else my patient has misunderstood my directions. If this sort of work *must* be done, it would, in my opinion, be better economy, better sense, better everything, to pay for it ten times over, than ruin your health, waste your spirits, and sacrifice the comforts of your domestic arrangements in this way." Her color rose yet higher, as we both looked round the somewhat littered parlor, in which Mr. Roberts was in a short time expected to dinner.

My remonstrances were not yet of any effect. My young friend was acquiring a young housewife's passion for work. She was what the women call neat-handed. She was inventive, ingenious, and loved to be fashionably dressed; and her whole time was accordingly spent in fabricating ornaments for her own person or her house. Hannah More speaks somewhere of six weeks of the precious time of an immortal creature being spent in embroidering a child's cap. She should have said—not by a poor creature who, to sustain the life of her own infant, must labor thus to decorate the child of some more fortunate woman—but by ladies commanding money as well as leisure. If Mrs. Roberts took not above a month to her christening-cap, it was because she was a very deft, and indefatigable needle-woman. Hardly was she earning the praise bestowed upon her by the good-natured of her own sex, of being a remarkably genteel, nicely-dressed young woman, and so excellent an economist! The ill-natured sneered at the foolish attempt of a person, such as she, striving to appear like one of thrice her fortune; and they perhaps were in the right.

CHAPTER II.—DUTY.

I have often been amused by the meaning women attach to particular words, and among others, to the stern word *Duty*—that principle by which the stars are kept from "going wrong," and households from being converted into dens of dirt and discomfort. One morning, on my way to Roberts' house, I called upon one of my numerous dowager acquaintances, to pay my respects to a niece of a certain age, then with her on a visit. I pretend to some skill in female works, for which, with my learned friends, I plead the example of Rousseau. When I had satisfied myself, or at least the lady, about the astonishing progress made by her pupils in the country, to whom my sister Anne had recommended her, I examined and admired her work.

"And such industry, Mr. Richard!" cried the aunt. "In the ten days she has been here, she has done as much as will trim five!—and yet we go about all day."

"My dear aunt," cried the younger lady, bridling, yet with a modest blushing disclaimer of all superhuman virtue, "I am only doing my Duty."

The duty was twisting tape into a zig-zag form, to make a railing for the bottom of her five new petticoats.

When I walked to Rachel Greene's, I met her at the door, going out to visit the infant school she had assisted to organize in this neighborhood, and which she anxiously and unostentatiously superintended. She invited me to accompany her; and I asked permission to take young Mrs. Roberts. I wished much that these neighbors were better friends. "Certainly," said Rachel cheerfully; "these visits will soon form to her, as they already do to me, a delightful Duty. I have of late taken a great fancy to watch children. I wish Friend Roberts and I were better neighbors. I used to love to hear her through the party-wall singing her hymns and psalms; but I think she has given that up." Here was unexpected liberality. Perhaps Maria's music might be only Italian melodies or opera songs; but I was not going to tell that to Rachel. Maria could not accompany us; she regretted it sincerely; "but all this must be done before dinner." She was making up a head-dress for an evening party—to save money. "You would not have me desert my duty?"

"Certainly not; but think beforehand, I would have you, of the kind of duties you lay upon yourself." Maria watched our return, and tapped on the window as soon as I had left my fair friend within doors. "O, that sweet, serene Rachel Greene," she cried, half laughing; "how I do envy her!"

"Had you seen her in the last hour you might."

"Nay, I shall be jealous too. Roberts gets as bad as yourself: we shall have green-eyed monsters among us, I can tell you, if we cannot be more Greene."

"Why not be as Greene as is desirable."

"Is it the soft vernal grass, or bright apple, or brilliant emerald green you would have me? Really, Mr. Richard, you would not wish me to turn Quaker?"

"Clearly not, unless your reason and conscience told you: I don't intend to turn Quaker myself, but I would like to see you turn a Rational, for which I am sure nature intended you, Maria; and from the Friends you may obtain excellent hints. With what you call your limited income, how much comfort and leisure a Quaker family could command; but how much more enjoyment could you command with your accomplishments and taste." There was, with me, one decided superiority which Maria held over my friend Rachel. Her different mode of education, and scope of reading and lively fancy, made her understand all my allusions, whether playful or sarcastic. This had at once established a certain intelligence and sympathy between us, even when we quarrelled. But if Rachel did not always perceive the point of my illustrations, Maria was far more backward in apprehending the force of my reasoning, when directed against her own notions and practices. It was in vain that I strove to convince her that the household god she had set up under the name of Duty, was an ugly misshapen idol, blubber-lipped and with squinting eyes, consuming the time and wealth of its votaries in the besotted rites of a stupid and blinded idolatry. In vain I talked to her of the slavery to which she was hourly con-

demning herself. She could not yet renounce her idol-worship.

"I wish we were as rich as the Greenes, Mr. Richard," said she, "and then I should be so happy to visit your Infant School, or walk, or read, or be social:—but at present—"

"Why, at present you spend more money than Rachel Greene."

"You don't say so! This last to be sure has been a dreadfully extravagant year; the outset always must; and that shockingly expensive dinner!"

"I can at once tell you what Rachel Greene's housekeeping cost in the last twelve months."

"Does she talk to you of her family affairs? I thought that had been indelicate, improper, in money concerns."

"So English people in general seem to think. Money is the only thing of which they must not speak—because they are eternally thinking of it, because it occupies their whole souls, and because, poor creatures! they really feel it a disgrace and crime not to have a very great deal of filthy lucre—or what is thought a great deal for them. Why else may not people talk with as much candor and frankness about their incomes as they do about their children, or anything else nearly pertaining to them?"

"Family matters! Mr. Richard?"

"Ay, family matters is the word. Be assured, Maria, it is either selfishness, insincerity, or coldness, that prevents *family matters* from being the topic most frequently talked over of all matters between true friends. These are interests, which, above all others, 'come home to women's business and bosoms.'"—(A long deep sigh—followed by a pause.)

"I believe that, Mr. Richard: but you perceive how the world goes—"

"The world of England?"

"All one sees, hears, or reads, forbids the sort of frankness, and the notions you hold. No one writes a book on education, on domestic morals, on household economy, or even on cookery, but what is adapted to wealthy persons—Miss Edgeworth and Rousseau included. Their systems are all concocted for people worth at least £500 a-year: and they require much more."

"I wish we had better elementary or guide-books, Maria. Your remark is acute, and far more just than many that are made by the critics on these works. Hannah More was an honest woman, when she said *Hints for the Education of a young Princess*, limiting her book to one individual. All works on education hitherto published, ought, in common honesty, to be entitled, *Treatises for Training the children of the Rich: or Books of counsel for the Wealthy*. We have no systems for the *Many*—but still we have our 'old experience'—"

"To what does it attain in my case, sir?" My young friend smiled upon me with so much sweet earnestness, that I could not help vowing my best efforts to aid in solving her difficulty.

"With given data to something like absolute certainty, Maria. For example, how much domestic comfort of the extrinsic kind, a family of three or four persons in London may secure for £200 a-year. Or take any British or Irish town, and vary our estimates from 15 to 25 per cent. You won't live £25 per cent cheaper in Kerry or Shetland than in London, believe me, Maria—nor

in any continental town I ever knew; though you may vary your style of living, you may *retrench*. If London is not a *cheap* place, to those who wish to make it so, then is the division of labor a mockery—cheap carriage and the principle of *competition* all *humbug*. But London is a *cheap* place, cheaper than Boulogne, or the Norman Islands, if you please to exercise your understanding aright—and exorcise, cast out, the Demon *Fashion*, and the *Imp Style*.”

“To return to the *data*, Mr. Richard,” said my fair friend. She really stuck better to a text than most women.

“The *data*, madam, in the present case, is 1971. 15s. 8^{td}.—I found it in Rachel Greene’s little book.”

“Sordid creatures!” exclaimed Mrs. Roberts, “with an income like theirs to spend so little! For what do they hoard?”

“You are unjust, Maria. You take their high-rate of income. So do all enterprising gentlemen who afterwards grace the bankrupt list. My friend Joseph Greene’s income, unlike my friend Mr. Roberts’, is fluctuating. This year his profits may be £500; next year £150, or less. Bad times have come on all retail dealers, and threaten to continue. His father made much more money in the same trade and shop. Now, Joseph and his wife, in their honeymoon—”

“A Quaker honeymoon!” cried Maria, in scornful mirth. “Fancy a pair of Quaker turtles!” (a scornful hollow laugh.)

“Call it what you will, Mrs. Roberts; it was the time of the first sensible, prudent, affectionate, and confidential talk between my friends, Joseph and Rachel Greene, by their own fireside, in the first month of their marriage: then and there they struck the average of the profits of our friend Joseph’s trade, and resolved that £200 a-year was all that could at present be reasonably afforded for household expenses.”

“Sordid!” again exclaimed Maria.

“Far from it. The only circumstance I ever heard Rachel Greene regret—and she speaks most frankly of her means of life, not considering that there is any difference between £50 a-year and £50,000, where each is the sole product of honest industry and diligence—is, that she cannot know exactly at the end of each year how much is over—to be laid up, as she said, ‘where moth and rust cannot corrupt, nor thieves break through.’ She already guesses, I suspect, that our friend Joseph admires a different kind of investment. All her own savings, I know, she devotes to deeds of benevolence. Her heart, like the hearts of most women, is naturally compassionate. She even gives to common beggars, and forgets the far-seeing wisdom of her sect, and of the political economists. One day I checked her. ‘Alas!’ was her reply, ‘that poor old man’s pale, emaciated face tells me a true story. Shall not we *women* apply the lenitive, till you *philosophers* cure the distemper; because that poor man may perhaps be so far an imposter, shall I harden my heart against my fellow-creature—my fellow-immortal? Him who, as a Christian, I am bound to hope will share the joys of heaven with me—shall I withhold from him my wretched pittance on earth? Is this to do the will of Him who maketh his sun to shine and his rain to descend, alike upon the just and the unjust?”

“Amiable woman! I was base to doubt her worth,” cried my young friend, in whose eyes

tears had gathered. “How shall I resemble her? Where learn like her to know and do my duty?”

However unfit I may be to give counsel, I am not the man to hear such an appeal with indifference.

“I have been surprised,” I continued, “to find how nearly Friend Rachel hit the mark in her expenditure. But she would not spend more—did not wish to spend much less. She has an excellent idea of the prices and values of all ordinary commodities, and of how much of everything is required in a family of a certain number; and this knowledge she possesses along with the domestic discipline, frugality, and good management, which the uniform, regular habits of the Quakers, and of many quiet English families, give their women, as it were, by hereditary right.”

“Management!” Maria’s ear mechanically caught the word. “Can you explain to me Mrs. Greene’s system?”

“I cannot—probably it is not what you would call a system.

A few good instincts, and a few plain rules, Maria, derived from her Yorkshire granddames. ‘Economy,’ says Johnson—no economist himself—is a very nice thing—one man’s coat wears out much sooner than another’s.’ Neatness, regularity—above all, order, and the absence of every sort of pretension, must be essential to her system. I believe that young housekeepers often fail from want of knowledge of the principles of arithmetic.”

“Of ciphering, Mr. Richard? Nay, I can challenge the whole Quaker and housekeeping world there! I got three prizes at school for ciphering.”

“But can you apply your knowledge, fair lady? Can you tell me in a moment how much a young couple, whose annual income is under £300 a-year—call it for safety £270—may afford to expend on one dinner? Come, now, by any rule you please? *Experience—Practice* is best—I mean without forestalling their income, an increase of their family rendering a certain enlargement of expenditure necessary.” Poor Maria fluttered and colored, tears again gathering to her eyes. I cannot say whether *management* or *maternity* now preponderated in her heart.

“I cannot yet tell; but I fear not so much as this.” She had unlocked the little desk, and taken out the *book* so thumbed and studied, and so mysterious in the frightful totals which it cast up out of *nothing*. To me the amount was at least not astonishing, as I was quite aware to what an enormous expense her absurdly extravagant Christmas Dinner must have come; the soups, the fish, the game, the jellies, the creams, the dessert, the wines, the hundred-and-one incidental charges, which any woman less clever and anxious to probe to the bottom of the evil would have overlooked or slurred over; but which here stood in a formidable array of figures. *Plunder* ought to have formed a considerable *item*, I dare say; but it was not entered under this head. It is always fortunate to make a good smashing loss at once, which may startle one, and put one on one’s guard. “18l. 5s. 3d.; well, I don’t think that so far out of the way, considering the good *style* in which the thing was done. Some things appear very reasonable—other items extravagant enough. A monstrous quantity of Epping but-

ter; but good cookery requires good oiling; nothing in the world goes sweetly at first without it."

"And we gave a very nice, genteel evening party with the left things—ham, cakes, jellies, and other things."

"And that is a *per contra*."

"Oh! Mr. Richard, a *per contra* to this abominable bill! No, no!—I am grieved and ashamed to look at it. How useful to me were half that money at present to get decencies and necessary comforts: no wonder Roberts says I cannot manage." This was unlooked-for humility. "I dare say Mrs. Greene would have given half-a-dozen dinners with that money!"

"Probably a whole dozen, Maria, all good of their kind, too; but then the party would have been small, in conformity to the house, the attendants, the income, the number of *real* friends—to economy, good sense, and true social enjoyment."

"I see it all, Mr. Richard; Roberts was right in saying I can manage no more than a baby—no more than a baby! Think of that, sir; you who have seen how I have labored for eight months out of the twelve I have been here, injuring my health, as you have told me often, and spending almost nothing upon myself: to be sure, I was fully equipped last year. I declare, when I have been chilled to death, tortured with chilblains, and threatened with rheumatism, I have denied myself a shovel of coals in my chamber, to economize; while Mrs. Greene has a good fire every cold evening, and her chamber so much more comfortable than mine, as they have no drawing-room; but let the Quaker ladies alone for taking care of themselves."

"To how much does *almost nothing* come, Maria!" was my rejoinder. "You must forgive my freedom, since you invite my counsel. Let us see." The little book was again produced. I was aware of one *irresistible* French summer bonnet and scarf, and an indispensable autumn evening shawl; but as it turned out, there were fifty other trifles, bits of lace, and joining lace, morsels of ribbon, scraps of gauze, gloves, shoes, &c., &c., that came, when summed up, to above £8. Maria was in astonishment. Her dexterous ciphering had never suggested anything like this. "What you say of my friend Rachel's extravagance in fire and *comfort*, is quite like her good sense. She keeps possession of her own house for her own self; lives to her own feelings, her own conscience, even to her own comfortable bodily sensations, rather than to idle people's eyes, or to fashion and vanity; and is she not right!"

"That Mrs. Pantague almost made me buy that bonnet and scarf, one day that she did me the honor to introduce me to her own *milliner*. I know it was wrong, too, to purchase *French* things. We should encourage the lace-makers and embroideresses of our own country."

I smiled involuntarily. "Now," she continued, "the Quaker ladies give no encouragement to the industry of their own sex. They wear no lace, embroidery, or fancy articles. And, surely it is right for women to encourage the industry of their own sex; and all ladies, you say, have a right to buy whatever they like and can afford."

"Which conscience and understanding approve:—clearly, Maria."

"Now, were we all to turn Quakers, the whole factory-women would be thrown idle, with all the lace-workers."

"Not idle; only differently, and, I am sure, better employed, in their own households, as daughters, wives, and mothers, for such rational length of time daily, as neither trenched on health nor enjoyment, and the mental culture, without which the condition of the human being, even with lace and embroidery, is but little above that of the beast that perishes. You blame the Quaker ladies for not buying lace and embroidery; do you know anything of the state of the poor women engaged in that manufacture, or in what you term fancy articles—married as well as single women?"

"Not much; only I know they work amazingly cheaply: so cheaply, that if I were as rich as Mrs. Greene, I would always buy, never make. That *thing*, as like an ungallant gentleman, you term my beautiful *canzou*, has cost me six weeks' labor; and I could buy it in a cheap shop in the city for 11. 2s."

"And certainly not the half of that sum went to the poor creature, who sat bundled up fourteen or sixteen hours a-day, poking her eyes out working it, earning from 6d. to 8d. daily. Have you ever had an opportunity of visiting the cottages or town-dwellings of the lace-workers in Buckinghamshire, Nottinghamshire, or Northampton county!—always abodes of discomfort and penury, often of actual starvation—where the natural order of things is very frequently inverted, the husband arranging the house, that the hands of the sickly, slatternly wife, may not be rendered unfit for the delicate employment on which her children's bread depends."

The free maids that weave their lace with bones, are among the most miserable of the slaves of civilization;—and its chains press upon and gall us every one, the rich as well as the poor. But let me not say civilization—it is fashion, vanity, madness, I really mean. Society cannot be too highly civilized. I would see it rise to far higher enjoyments among its Marias, than this everlasting *ornamenting*, and needle and scissor work."

My young friend took up a book, with an arch glance at me. "This is a favorite writer with you, sir. What says he!—'I love ornament: all nature is full of it.'"

"And so do I, love the ornament with which all nature is full: its colors, odors, forms; all its exquisite beauty—intricate or palpable, universal or minute—cannot be enough admired and glorified. Flowers, 'the stars of earth;' stars, 'the poetry of heaven;' these are the ornaments I love—and for this, among a million reasons, that their beauty is immutable, unchanging. The rose has been the '*red, red rose*,' with the same rich foliage, since it first blossomed in Eden. The pale lily has risen on the self-same graceful stem since the general Mother, 'fairest of her daughters,' first bent her dewy eyes upon that flower of Paradise. So when you quote Leigh Hunt against me, Maria, in favor of changeful fashions, as well as profuse ornament, you must quote in the spirit. If the rose chose to prank herself every season in new garniture, and sported yellow flowers with blue leaves this year, and brown with white the next, I should tire even of her; if the lily forsook her slender stem and changed her pearly white

that—her Naïad-like beauty—to flaunt in crimson, with glossy leaves, I would be for instantly deposing her as the Queen of Flowers:—yea, if Jupiter himself—

The star of Jove, so beautiful and large,

chose to astonish the nations by rising to-night, angular in shape, with a deep, sapphire radiance, and to-morrow in flame-colored taffeta, I would vote him a huge bore—and anything but an ornament to the heavens. The analogy between the ornament of which all nature is full, and the perpetually-changing, gaudy, inappropriate artificial ornaments of vanity and fashion, does not in the least hold, or rather it makes for me."

"Then you would not discard all beautiful, all magnificent things, nor even our pretty decorations?"

"Certainly I would not—only ugly trumpery, useless trash, to which you make yourselves slaves."

"Lace, for example, that exquisite fabric which Rousseau admired so much!"

"The *Man of Nature* was in many things a very sophisticated, artificial personage, Maria—almost a coxcomb. I have no objection to your lace, and delicate needlework; though, in my Arcadia—my ideal republic—the beauty, health, and spirits of one order of the women shall never be sacrificed, that another may wear a thing about her face which Rachel Greene looks very pretty without, and Maria Roberts also."

"A compliment by implication! I shall value it were it but for the rarity," said my laughing companion. "Well, though our caps and veils cost something, pink bows and *brides* included, the Quaker ladies don't dress—*clothe* themselves—I beg pardon—for nothing. In the quality and fineness of the material, they are perfect *exquisites*."

"A consequence of really enlightened economy. Mrs. Greene seriously asked me one day if I could, in this part of London, recommend her to a *dear* shop. Persons with whom a fashion lasts till a garment wears out, show good sense in making it of such materials as are worth bestowing labor upon. But let us reckon now, Maria, the real difference of money-cost between your lace English cap, and Rachel's snug Quaker one; or, say, between it and the tasteful veil of thin muslin, the becoming head-dress of a Genoese girl."

"I presume the Genoese head-gear, like the Quakers—(like, and yet how unlike!)—may cost 2s. or 3s.; mine, my own labor, *brides* and bows included, at least 25s.; so there is a clear 21s. or more for Rachel Greene to hoard, which I distribute in encouraging manufactures, you perceive, sir."

"To spend on her *Infant School*, as like, Maria; or very probably in fuel or flannel petticoats for the poor creatures who have become sickly, and prematurely old, spending their life in fabricating ornaments for more fortunate women."

Maria sighed at this view of the question. "I do envy the rich, and the *Friends*, their means of benevolence."

"Don't be content with envying—*attain*; go to the fountain-head. The means of enlightened benevolence are in every one's power. Begin with my amiable young friend, Maria Roberts; emancipate her, in the first place, from her profit-

less, thankless toils, and this will be one great good gained."

"If the *world* would only come to your way of thinking, Mr. Richard:—the first edict, I assure you, of your king, *Ladies*, and Commons, which commands more rational conduct—"

"Unfortunately edicts won't do it." There was consequently no more to be said. What Maria called the *world* was still too strong for her. She was more and more its reluctant and repining slave; but not the less fettered that her very restiveness made the chain gall and fester.

Before I saw Mrs. Roberts again, she had suffered from a severe rheumatic fever, produced by the cold sifting airs of her attic chamber; and by imagining that it was absolutely necessary to have furs to wear abroad, while flannel and fleecy hosiery might be dispensed with, not being *risible*, which, by the by, seems the practical belief of two thirds of the female world, where both cannot be obtained.

Towards the end of the year tradesmen's bills, of all sorts and sizes, came tumbling in. Every new bill was a fresh surprise; yet their items were like housemaids' newspaper characters, *undeniable*. Maria studied, and summed and filed, but could not cipher away the startling amount; and now mistaking the reverse of wrong for right, as far astray as ever, and more offensively so, the small coal was meted out by scuttlefuls, the salt by cupfuls,—she counted the candle ends, and reckoned the potatoes. The small joint was charred for want of fire and Epping moisture, the pie-crust smelt of rancid kitchen stuff. Roberts, in an angry fit, vowed that he would dine at an ordinary, and the maid mutinied. Another was procured—*cheap*—an awkward country lass, who, hitherto accustomed to handle only wooden pails and buckets, broke all more brittle wares. Roberts was for the time appeased. Indeed, if he had not, he must have been a savage—for poor Maria, almost killed with mental anxiety and efforts at management, gave birth to her first child; and, to save expense, dismissed her nurse so soon, and was taken so seriously ill in consequence, that my sister instantly procured a country nurse for her infant, and another for herself, scolding the unhappy Roberts for his senselessness; and making such inroads on Maria's saving and plans of retrenchment and economy, as I fully believe retarded her recovery.

By the middle of February Maria was restored to health—pale and meagre enough, but quite well as she vowed; and she brought home her child, from affection and economy, to be what old Irish and Scotch nurses call brought up "by the pan and the spoon,"—and English ones, "by the hand."

The christening feast and annual Christmas holiday-dinner were to be consolidated this year in furtherance of economy and retrenchment. Maria had given up her needle. She was now an active housewife. Long were the consultations we held. "I will show you a different bill from last year's," said she to me with harmless exultation in her newly-acquired knowledge, "You shall see how I will *manage*!"

I had no wish to damp Maria's ardor, nor yet to check the current of her self-teaching. *Painful* experience I foresaw it was to turn out, but not the less wholesome in its effects. Her first dinner had been the *senselessly-ostentatious*; her

second was to be the most absurd of all, the worst of mistakes, the *shabby-genteel*. I reserve its mortifying details and consequences for another chapter.

CHAPTER III.—THE SHABBY-GENTEEL.

At the top a fried liver and bacon were seen ;
At the bottom was tripe, in a swinging tureen ;
At the sides there were spinach and pudding made hot ;
In the middle a place where the pasty—was not.
GOLDSMITH.

How often soever it may have been said, that we never seem ridiculous from what we are, but from what we assume to be, the saying remains as true as ever ; and, therefore, I once more repeat it, at the opening of this chapter. Taken in this sense, ridicule is indeed the test of truth, for nothing *true* can be in itself ridiculous. We may smile in contempt or derision of conceit and folly ; or laugh in sympathy with comic or ludicrous scenes and ideas ; but it is pretension, assumption only, that move our ridicule. To be above its insolent insulting inflictions we have only to be ourselves ; which simple part, to the bulk of mankind, appears the most difficult to perform of any. Our social customs universally conspire to make us attempt everything, rather than display the real character ; but above all to conceal the true circumstances in which we live. We must either seem above, or—though far more rarely—below them. The very wealthy do sometimes take to

The Devil's own vice,
The pride that apes humility,

as soon as they rise above the more common affections of vanity.

My young friend, Mrs. Roberts, exposed herself to *ridicule*, by the common folly of assuming to give dinners, to dress, and to live in the style of persons of double her income : but, for the credit of English morality, I regret to say, that she only incurred the penalty by attempting to reconcile discretion and honesty with what, in such circumstances, was quite incompatible. Extravagance, folly, debt, gross dishonesty, might, in short, have been pardoned, where the thing was managed with *dash*, and a proper understanding of effect ; but who can pardon the *shabby-genteel*—abhorred of gods, men, and charwomen ! And on a charwoman turned the fortunes of Maria Roberts' *Second Christmas Dinner*.

I mentioned in the last chapter that she had, from frugality, hired one of those wondrous machines, a *maid-of-all-work*, ignorant and stupid, at half-wages—who made up the balance by breaking china and glass, and damaging every article of furniture that fell in her way. I have frequently noticed that notable housekeeping ladies are, in general, fatalists about breaking. Mrs. Roberts, after the first three months, concluded that Jane had got through most of her breakings. "And she was so good-hearted and kind to 'baby,'—that important small personage in so many small households—and was believed so honest." "With myself, Jane, and the charwoman, and a good deal of forethought, I can manage very well," said Maria, at one of our final consultations. "I shall have everything possible done beforehand—the cooking will be all over before the company begin to arrive—then I can dress in a minute ; and Biddy, [the Irish charwoman,] when

she has sent in dinner, can assist Jane to wait at table. I cannot think of having one of those insolent fellows of hired footmen in the house again ; and those cooks who go about, are so horribly extravagant, conceited, and dictating—one of them, whom Mrs. Pantague hires to assist her cook, charges 15s. a-day ; and must be *wine'd* and *portered*, and waited upon and coaxed."

I entirely approved of dispensing with the perambulating footman, whether "of parts or figure," and also the consequential cook mentioned, whom I knew to be as troublesome and conceited as if she had taken a regular diploma from M. Ude ; but how Jane and Biddy were to perform their various functions was still an affair through which I could not see my way. Of the latter I had indeed considerable suspicion all along ; strenuously as I understood she had been recommended by her countrywoman, my neighbor, the orange-seller, Mrs. Plunkett, as possessing every good quality requisite under a kitchen roof, "had lived cook in genteel families, both in Bath and Dublin city itself ; and in her first husband's time, assisted the cook to the mess of the 92d regiment, though that was fifteen years ago."

My doubts threw Maria into fresh perplexity : she studied her bill of fare. "It would be taking too great a liberty to ask Mrs. James Taylor to lend me her cook for a day ; but I might ask her advice—she is always so genteel, and so kind to me."

"But you won't ask her advice though," I put in abruptly. "My sister Anne is one of the best women that breathes ; no one more amiable, more generous ; but, good worthy lady, she has been happy and moderate enough never to have known any one serious domestic difficulty in her life. She has always been so perfectly at ease in money matters herself, that, like many more excellent women one meets, she is rather puzzled to find out why other people are not as much at *their* ease, and have not everything as *nice* and proper about their nurseries and their table as herself. When Roberts can allow you 600*l.* or 800*l.* a-year for your housekeeping, about half my brother's liberal allowance, then advise with my sister Anne. She can discourse most sensibly on economy, and wonder, too, how people need be so very ill off. In which sort of surprise, I have seen her sensible husband join her, and with a most proper and husband-like admiration of his wife's domestic talents, declare that where families do not go on well, (with probably not the fourth of her means,) there must be bad management at bottom. And yet they are among the best people I know. To comprehend the exigencies of your position in society, or rather that of struggling professional people, the most difficult of any, is quite out of their way. Your part in life, once clearly ascertained, ought to be easily filled."

"I assure you, to me it seems the most difficult of any. If with the fourth part of Mrs. James Taylor's income, one could do with the fourth of the beef, bread, tea, coals, candles, butter, and so forth ; but you see how it is—that would be no rule, and what to save upon, while one must have everything the self-same as those wealthy people—"

"Or at least some *mock imitation*, and *make-shift* thing, Maria. Well, it is a wretched system, a despicable slavery—this making one guinea do the fashionable work of three, or *seem to do* ;

for, after all, it never gets beyond seeming. Like the foolish bird, we hide our heads under the wing of our own vanity, and fancy that the whole world is not seeing and laughing at us, because we have hoodwinked ourselves."

I had probably pushed the conversation beyond the point of politeness; for on this subject, and with so interesting a victim before me, I could have no reserve or patience. Sometimes my heart misgave me, and I was on the point of warning Maria against the absurdities she was about to commit, and the ridicule she was to draw upon herself, by her "Three Courses and a Dessert;" but stern friendship counselled that I should let her do her worst, and endure the penalty of shame and mortification at once and forever.

I undertook several little commissions for Maria, connected with her *fête*, and promised to come myself very early, to amuse Mr. Sam. Madox, a cockney bachelor of some sixty years; somewhat of a virtuoso, but more of a *gourmand*, finical and withal priggish, and known by the ladies of the many families with whom he managed to be a dinner-visiter, as "that plague, old Madox, who always comes so early." Not that he came a second before the appointed hour, but to that he appeared punctual as the hand of his watch.

I did not appear before my services were required. Great as are the mysterious powers of ubiquity possessed by the maid-of-all-work, it is still just possible that the most thorough-bred of the corps cannot overtake everything. When I arrived, all was, as is said, at sixes and sevens. The parlor fire was still unlit; the confusion in the kitchen might have been, as the charwoman who made it, said, "stirred with a stick." Maria, in a morning gown and apron, not over clean, of course, and her brown tresses in papillotes, was hushing "baby," who squalled, as if on purpose, ten times louder than ever he had squalled before, and casting looks of distraction and despair on Biddy, the regular charwoman and brevet cook. To me the latter was the most amusing person of the group. Maria watched her as a clever sensible patient may an ignorant surgeon, certain that all was going wrong, that some dreadful mischief was impending, but overawed by the dignity of the profession, and afraid to interfere. Mrs. Roberts was conscious that, though perfectly able to judge of results, she still knew little or nothing of preliminary culinary processes; and was, in many cases, an entire stranger to the mode by which particular effects were to be produced. It was not difficult to perceive that Biddy, if she had ever possessed the requisite skill, had let her right hand forget its cunning. Like all other persons in office who do not know their own business, she required a deputy.

"Sorrow be on you, girl, won't you give me the cullender; and the tureen, as you see, between my own hands." Mrs. Roberts flew with the desired utensil. "Och, excuse me—is it yourself, ma'am—where the *diavol* has that creature Jane put the dish-cloth, which was in my own hands this minute. In troth, then sir," continued she, looking at me with one of her broadest grins, "if you don't lave that, we'll be thinking of pinning it to your tails. But just mention, mi-lady, now, what sauce you would like for the roast bullock's heart, that's to relave the soused rabbits and onion sauce."

"Oh, not the rabbits," cried Maria: "surely you know better—you can't forget it is the

Hessian ragout, that the mock roast-hare relieves—"

"Well, never mind—the one or the other it is, any way. Sure, I saw it oftener than there's teeth in my jaws, both ways. With the mess of the 92d it was always the t'other way; but your ladyship may take your own way for all that."

"Think how time flies, my good woman," cried the anxious hostess, "almost five! Will you take another draught of beer—and then the pheasant—not singed yet. — Mrs. James Taylor has sent me such a beautiful pheasant!"—

"We'll be none the worse of the liquor, any way, ma'am. And is not he an illigant love of a bird, now, Mr. Richard—many is the likes of him I seen in my own country—only a thought larger. (*Drinks.*) That's no bad beer. Cox's house is one of the best in Lunnon, both for measure and quality. But would you like his head twisted this way, ma'am, or that way, ma'am? He is a prince of a bird! He'll grace your table, ma'am!"

"So I hope. It was so good of Mrs. Taylor to send me this game—I never would have gone to this bird's price. But dear me, cook, truss the head any way: really, my good woman, this is no time for conversation—pleasantly as you talk—any way with his head—you know best about that."

"*I shud*," was pronounced with emphatic brevity; and the neck of the unhappy biped was twisted every way but that which fashion or custom prescribes and calls the right way. Maria guessed as much; and I admired the strong good sense and presence of mind which prevented her from fretting, or standing on trifles in such an emergency. She was like Napoleon giving his commands to the surgeon accoucheur of Marie Louise. Mrs. Roberts' silence seemed to say, "Treat my golden pheasant as if it were but an ordinary barn-door fowl."

"And never fear," replied Biddy, "I'll have him in in pudding-time, I warrant me—the pisan and the sowles, ma'am, first—an't that it?"

"O dear, no, no," cried Maria, now thoroughly vexed. "The pheasant—the game, is for the third course."

"The third course! Sure I have seen him in the first, when a donny bird like that, both in mi-lady Ark's, and Mr. Sergeant Saurin's too."

"But in England—O Biddy! Well, you Jane, you will surely remember when the pheasant is to be sent in. Here's the bill of fare."

Again, perverse "baby" squalled out, and drowned all our voices.

"Such a scene, Mr. Richard—will you, pray, step into the parlor, Jane has lit the fire now again, I hope. O, baby, cruel baby! if you knew what your poor mother has to undergo to-day, you would surely be a better boy. Gracious! that's old Madox's knock!"

This luckily proved a false alarm; "baby," by good fortune, had now exhausted himself in squalling, and fell asleep. Maria had five minutes to dress; but how, she whispered, could she leave that fearful Biddy.

"Make yourself asy, ma'am: trust to myself, and mind you your good company. First, the sowles, and the *Hessian ragout*: but there's no

good any way of letting this drop of beer die a natural death in the mug. A merry meeting of friends to you, mi-lady! and trust your dinner to myself, and I'll do it handsome and gentale, as Mr. Richard there will tell you."

The maid, by power of bellows, had by this time forced a tardy reluctant fire in the parlor, and sent clouds of ashes over all the neatly laid-out table, the labors of the indefatigable Maria. Willing to be useful, aware that the mode of a service may often double its value, and having no fitter means, I dusted all round and over with my veritably *clean* silk handkerchief—and sagaciously comprehending that a bundle of half or one-third-burnt wax-lights, such as thrifty housewives buy cheap in London, were meant to be stuck in the candlesticks, but forgotten by her of all-work, I also performed this other duty. And now Madox fairly knocked, and Maria flew down, adorned, from her attic chamber. Miss Kelly never shifted her costume more rapidly. We were both in the passage on our way to the drawing-room; but the final orders were to be given to panting Jane, who was about half-dressed. "Now, for any sake, Jane, don't forget what I have driven into you! Don't affront me by your stupidity; the thickened butter—and to have the coffee hot—and to heat the cream—and the drawing-room fire; and oh, do try to keep 'baby' quiet, if he awake; and don't let him pull his nice cap. But don't put it on till I ring for him—and above all, be sure you don't let Biddy roar so loud, or touch more beer—you know what a beast she makes of herself—she will spoil the dinner, and break the things. O! that plague, old Madox! How he does knock!"

"Yes mar'am—no mar'am," followed at intervals from the bewildered maid of all-work, whose replies were mechanically measured by time; certainly not dictated by sense, for true it was, as Maria said.

"Now, Jane, you don't know a word I have been saying to you. Oh me!"

Maria had not composed her looks, or drawn on her gloves, when Mr. Madox was upon us in the blue drawing-room.

Whether the devil tempted him or not, I cannot tell, but he talked away at no allowance of the excellence of the London markets always at this holiday-time. Fish so good—salmon, prime—game—wild ducks—teal. It was the very season for the London carnival.

Mrs. Pantague here sailed in imperially—spread abroad in brocade, capped and jewelled; and after the ordinary compliments, the discourse flowed in the former channel. She had been ordering things that morning, though she rarely marketed herself. Mrs. Pantague was one of those many English people, who use the possessive pronoun on all possible occasions. "My fishmonger." "My confecti-ner." One might have thought she held the whole of each poor man in sole property. My cook is nothing.

"My cook is so exquisite a judge, that I rarely look at anything. I can so fully rely upon my butcher. How do you manage, my dear Mrs. Roberts?"

"The London markets are splendidly filled at present, ma'am," said Plague Madox to the great lady. "Few London sights equal to them after all, ma'am."

"And so they are, Mr. Madox: Paris, Brussels. I don't say much about Vienna, though my

friend, Lady Danvers, who lived long there, when his lordship was connected with the embassy, has often told me that Vienna is in *bonne chere* a superb city; but after all, Mr. Madox, as you say, commend me to the London markets. Cookery may be better understood in Paris. You have been in Paris, I conclude, Mr. Madox—often?" Madox bowed. "But for provisions; the sterling English staple, as Sir John says, London may challenge the world, fish, flesh, or fowl."

"Right, madam, and so it may. Old English roast beef, the growth of every county. Banstead mutton, Essex veal, Dorking fowls, Norfolk turkeys, Lincolnshire geese. Hey, Mr. Roberts, got before you." Maria bit her lips over the alimentary catalogue of the month, while Roberts saluted the company.

I cannot go into the mortifying details of this *Three Courses, and a Dessert*. The bawling, and mishaps of Biddy, the blunders of distracted Jane, the agony of poor Mrs. Roberts, and the distant squalling of "baby." Even I could not have anticipated a chain of such mortifying accidents, though they were all quite natural.

The awkwardness of the guests who possessed politeness and delicacy, and the ill-suppressed grumbling of the ruder natures, disappointed in that great affair, a dinner, was nothing to the airs of insolent disgust, with which Mrs. Pantague pushed away plate after plate—touched, yet untouched. I must acknowledge that the *soles* were not of the freshest, though they might be correspondingly *cheap*, nor were they the best cooked. Mrs. Pantague, in pure malice, I am certain, required to have the dish named *Hessian ragout*, analyzed by Madox.

"Bullocks' cheek stew! that is a ragout I am not acquainted with; not any, thank you: indeed I have dined." The great lady leant back in her chair with a look of haughty yet piteous resignation to her fate.

"There's a pheasant coming," faltered poor Mrs. Roberts. It was in her dinner like the single great lord among a vain man's acquaintance.

"I will trouble you, Mrs. Roberts," said my hearty brother James, "I did not know the dish under its fine name. You remember, Dick, how we used to lay our ears in this stew at Nurse Wilks' on Sundays. Never was turtle so glorious."

This was scarcely a rally for Maria. At another time it would have been mortification. Plague Madox now ventured upon "Just one-half spoonful of the ragout—thick;" and, after cautiously reconnoitring the table, had the dose repeated. This looked better; and

By and by, the second course
Came lagging like a distanced horse.

Bullocks' heart stuffed and roasted has its admirers even among *gourmands*; but then it must be *roasted*, sanguinary as English eaters are. The condition was, therefore, a capital disappointment to more than one gentleman, and worse to Mrs. Roberts, compelled to say, "Take this away," though it had been her main reliance; a dish that both Mr. James Taylor and Mr. Madox particularly admired—and rarely saw. A young puppy, one of Mr. Roberts' friends, who had got, by chance or accident, a copy of verses into a maga-

zine, and set up literary pretensions accordingly, regaled us at our side of the table with the story of "De Coucy's Heart," and the "Basil Pot," till the ladies began to look pale and sick. Across the table there was a dialogue on cannibalism and the New Zealanders, which, so far as it was heard, did not mend our health nor quicken our appetites; but all this was nothing to the tremendous crash which came at once above, below, and around us! and the exclamation.

"Och diaoul! come quick, jewel, Mr. Richard. Did not the kitchen chimney go on fire—we are all in a blaze!" And Biddy, like ten furies, was in the midst of us.

The ladies huddled together and screamed, and would have run into the street—if not prevented by main force, backed by my speedy assurance that this was a false alarm—merely a blaze of overturned grease as their noses might inform them. Maria, forgetting everything but a mother's feelings, flew to find her child, who appeared among us after all in his night-cap, but yet helped wonderfully to restore tranquillity, as all the women were bound in turns to seize, and kiss him. Things looked better again. The *sweets*, previously prepared by poor Maria with great pains and care, and want of sleep, and a wonderful effort for a first, got the length of being "damned with faint praise" by the lady-judges, though Mrs. Pantague did recommend Mrs. Roberts to try "My confectioner only for once. He was, to be sure, an unconscionable wretch in his prices—but exquisite in taste. His *Vanilla Cream* was allowed to be unequalled in London. It was sent to the Pavilion, and to Devonshire House, when nothing else of his was taken. It was indeed a great favor to procure it." What was the final catastrophe of the pheasant I cannot to this day tell, but he never appeared; and Plague Madox indemnified himself with *blue stilton* and some tolerable Edinburgh ale. The port—it was called clarety-port—something that was to unite *cheaply the body of Portugal with the spirit of France*, he had sipped—eyed between him and the candle—and pulled in on trial another decanter. I suppose the sherry, or rather Cape Madeira, he hit upon, was a leap out of the frying-pan into the fire. He actually made faces.

"Who is your wine-merchant, Roberts?" cried loud Mr. Pantague, the stock-broker, from where he sat by the elbow of the miserable hostess, who had now lost self-possession and almost temper, and who afterwards told me that it was with great difficulty she kept from crying. Pantague was also smacking critically, and holding his glass between him and the candle. Roberts looked as simple as his wife, and more vexed. Either no current name of value in the wine-trade occurred to him, or he might not like to lie. He had, after a moment's pause, the forethought, the true John-Bull spirit and manliness, to say, "The very little wine I use, Mr. Pantague, I buy where I find it best and *cheapest*."

"O right—quite right," cried Mr. Pantague, and he tossed off his glass. This was the most hopeful feature of the night. Could I have caught the eyes of the speaker mine would have thanked him.

"Very fair port, this," said Mr. James Taylor, the rich thriving solicitor. Plague Madox drew his red wine glass to him again, and filled it once more. "New; but very good: what say you, Dick? My brother is one of the best judges of

wines now in London. You need not gainsay it now, Dick: your Italian residence, and your early pursuits, have made you so; but I believe you refer it to your unsophisticated palate."

I rose one hundred per cent. with the company in one second; and resolved to improve my sudden accession of vinous fame to the benefit of Maria Roberts.

"There ought to be *wine* in this house; ladies' wine, at least," I said, nodding, knowingly to Mrs. Roberts. "If the lady of it would only appoint me her butler for the night, I think I could find it."

"With the utmost pleasure, Mr. Richard; but you know—"

"What I know—give me your key." Maria stared at me. There was method in my madness. I returned in five minutes, or rather more, and solemnly placed a couple of pint bottles upon the table. Jane furnished me with fresh glasses.

"I am not going to accuse our hostess of not bestowing the very best wine she has upon her friends; but I am afraid I must accuse her of not having taste enough in wine to know the value of her own treasures."

"Nay, if I had thought that half as admired as—"

"Give me leave, ma'am. We need not mystify the matter. This is two of six bottles, but we must not rob Mrs. Roberts of more than one, this little cobwebbed fellow, that came as a present from the Bishop of —'s cellars; sent by his lady to her goddaughter, our amiable hostess, before her late confinement. The late brother of the bishop was for some time governor at the Cape. Give me your opinion, ladies, of this *codling* wine, that you send in presents to favorites." I had said enough for a lady of such quick tact as Mrs. Pantague.

"Delicious Constantia!" was her affectedly rapturous exclamation. "'T is not everywhere one meets with the like of this. And the bishop's lady, whom I have seen at Brighton, is your godmother, Mrs. Roberts?"

"I have that honor."

"Exquisite wine! The veritable nectar of the gods, Mr. Richard, must be Constantia. Nay, nay; this must be kept for a *bonne bouche*—husbanded—a fourth of a glass, if you please." I had no wish to hazard a second trial, having come off so well upon the first.

"The *bouquet*, the delicious fragrance of this wine, is its charm to me," said our young poet. "You must be sensible of it, Mr. Richard!"

"I'll be hanged if I smell anything save the burning grease the cook had nearly set the chimney on fire with," replied my brother. "She seems, by the way, on very happy terms of familiarity with you, Dick; and quite a character in your way. I believe you know all the Irish charwomen in London."

All the ladies tasted the "delicious Constantia," while Maria, trying to look frowningly, really looked half-comic, half-amused, at my impudent fraud. Several of the fair judges pronounced it very fine. My sister, Anne, said it was very sweet and nice indeed, but of wine she was no judge; and Miss Claves, a very lively young lady, vowed it was so like Milk Punch, which was quite a charming thing, that she could not tell the difference for her life.

"Oh, the *green* taste of *raw* girls, Mr. Rich-

ard!" whispered Mrs. Pantague. "How many good things in life are thrown away upon them! Your niece, Charlotte, has really then positively refused the old banker—her ultimatum given? But will Mrs. Roberts never move, think you? Really, to be frank, I long for a cup of even cold wish-washy coffee after this (*a shrug*) absurd *visceral* repast. I wish some friend would give the poor young woman a hint! Could not you, Mr. Richard?" She looked at her watch.

I vowed in my indignant heart that Maria should, in hearing every word of this, reap the bitter fruit of her own vain toils. But I did not need to be so severe in my lesson.

Before the poet and myself reached the drawing-room, half the ladies had disappeared. From below Plague Madox, my brother, and all the old sagers went off without looking near us. The claret-port could not have been very good, after all, I suspect. Madox swore that either the wine or the fare had deranged him sadly; for three days fairly baffled Dr. Kitchener's *Peptic Precepts*, lost him two good dinner parties, and raised doubts whether he would ever accept an invitation from Roberts, or any man who kept no regular cook, in his life again, where everything was, he said, "more provoking and worse than another. Pity the poor fellow with such a wife!"

In the mean time I have forgotten to tell, that, when very late, George Roberts, and a few young men, who, in spite of every disaster, stood by him and the bottle, staggered up stairs. I was now alone in the drawing-room. The young ladies, after yawning, hour after hour, in the vain hope of relief from below; after examining and re-examining Maria's store of nick-nacks, and hopelessly endeavoring to extract music and young gentlemen from the broken-stringed cabinet piano-forte, had all taken wing while Maria was gone to put "baby" to sleep.

Roberts was half tipsy, half chagrined, and I perceived in a fair way of getting into very bad temper. This was his day of festival, the christening *fête* of his first-born; and there was no joy, no sociality, no pleasure, no amusement. He had promised his young friends, his wife's music, female society, a dance, and there remained for them an empty disordered room, where "Queer Mr. Richard Taylor" kept watch over four blinking wax-candle ends and a few smouldering cinders.

"Where are all the ladies—where is Maria?" was said hurriedly. "Where is Mrs. Roberts?" in a more imperative, and husband-like tone. Echo might answer *where*, if she chose, but I was dumb. Roberts jerked the blue bell rope; and down it came, and up came panting Jane.

"Where is your mistress?"

"Putting 'baby' to sleep, sir."

It would be treason against nature to suppose that Roberts could really have said "Deuce take 'baby,'" but Jane, who looked perfectly aghast, and, indeed, in utter horror, certainly believed those shocking, unnatural words were spoken; and had they even been, they would have meant nothing serious—a proof that a man must not always be judged by his rash expressions.

"By Jove!" was the next exclamation, "if we cannot have amusement above stairs, we shall have jollity below. Here you, Biddy, or whatever they call you—"

"Biddy Duigenan, an' please your honor—so christened by Father—"

"Get us a dry devil, or a broiled bone, or something peppery and famous."

"Och then! devil a bone with a thread on it, within the dour of ye. The mistress chooses her mate without bones. She's a mighty frugal, managing young cratur."

This conversation passed aloud, between the door of the drawing-room and the bottom of the stairs. The young men roared in full chorus; and Mr. Sullivan the Templar, instantly challenged a countrywoman in Biddy, who was heard laughing jollily below, crying to Jane, "Faix, but it does myself good to see the gentlemen getting hearty and merry at last. One might thought their faste a *Keason*—no luck till the bits of misses, the cratura, go off."

"By the powers! if we can't get meat we shall have drink, boys," cried Mr. George Roberts again, in a most uproarious and savage humor, something affected too by the satirical commentary made by one of his friends on "a lady choosing her mate without bones," which as a husband of some eighteen months, and consequently still very touchy on the score of *hen-pecking*, he fancied it mightily concerned his honor and masterhood to resent.

"Ay, bones and blood, and spirit too, by Jove. Maria! Mrs. Roberts! Madam, I say, come down stairs! You shall see, gentlemen, who is master in this house—if all the wives in Christendom!"—But it is idle to repeat the ravings of an intoxicated man. I knew Maria would have the delicacy and sense not to come down stairs; and Sullivan, by far the soberest of the party, having brought our host to order, and promised to me to take care of the party, I stole away. Jane, as I afterwards learned, a simple country girl, immediately became so frightened, that she crept up to her mistress, reporting "that the gentlemen were tipsy and riotous, and that one of them had pulled her on the stairs. Master was tramping up and down, rummaging all the cupboard for brandy to make punch; and Biddy was worse than all the rest." Maria, a stranger to every species of excess, a girl transferred from school to her own house, became more nervous than Jane; and as the noise of song and revelry,

Of tipsy dance and jollity,

rose louder and louder from the polluted blue-room, constituted into a kind of *Free-and-Easy* club-room, the women bolted themselves in. Jane, after her hard day's work, soon fell asleep, sitting on the floor, and it was not till the watchmen, attracted by the riot within, had rung repeatedly, and that the young men sallied out "to thrash the Charleys," when a general *mêlé* ensued, that she was awake by the shaking and suppressed cries of her mistress, as the whole party below, Biddy Duigenan included, were carried off by the guardians of the night, and safely lodged! How Maria got through the dreadful night, I cannot tell; but I lost no time, after receiving her early message, in repairing to the office. Mr. Roberts and his friends were already liberated without examination, and had slunk away, bribing Biddy to silence with sundry shillings and half-crowns.

Roberts looked foolish enough when I found him at home, sitting amid the wrecks of the blue-room, writing a note of apology to Joseph Greene for the nocturnal disturbance; but he still seemed

to believe that the whole mischief arose from Maria's absurd management, and that air of pretension, which, together with the *shabby gentility* of her entertainment, had made them both ridiculous. To the same cause he imputed the discomfort and mal-arrangement of everything—nay, even what he termed the impudence of that Irish hag, and the insolence of that stock-broker's dame. He did, however, condescend to apologize to his wife for the outrage of which he had subsequently been guilty; and his boon companions of the night, one and all, afterwards declared, that they durst never look Mrs. Roberts in the face again.

This was not the end of the affair. Roberts was forgiven by his wife, who, in her ignorance of *life*, fancied his conduct far more grievous and degrading than he was disposed to own it. But there was another reckoning to adjust. By some means my brother got intelligence of the manner in which Roberts' *fête* had ended. "A married man—in his own house—it is too bad. I fear this is not the first of it," James said to me. "For some weeks, Richard, I have wished to consult you about this. Do you know, Roberts is short of his cash?"

Awful charge against a confidential clerk! I guessed how much it imported.

"To what extent?"

"No great extent; but the thing is so wrong, so *unbusiness-like*." This is another most significant phrase. "About £60 or £70—and perhaps he may have some claim against me; but I don't like the look of it. Such arrears are so *unbusiness-like*. I fear he is extravagant—getting dissipated—"

"Only foolish—or something of that sort," was my careless reply; "but he will mend, I dare say. What, meanwhile, have you done?"

"Ordered him to balance his cash, and pay up by Friday at farthest."

"Quite right."

I instantly took my way to the Row. Maria was in the blue drawing-room; now in its gilding and draperies of all hues, soiled and tawdry; the ornaments smoked and tarnished; the chairs and tables crazy or fractured, and the purple and gold purse sadly faded from its original splendor, as I remarked on seeing it on the table.

"Alas! it has acquired a worse fault," Maria said, while she shook it to display its emptiness, smiling and sighing.

"A sieve-like quality—the faculty of running out faster than Roberts pours in—"

"Something very like that, I confess."

"Do you pardon my frankness, Mrs. Roberts, and give me leave to be sincere with you?"

"I do, I do, and thank you most sincerely. With our limited income"—(*hesitation.*)

"All your stitching and pulling cannot keep fortune in at heels, and make both ends meet."

"You have guessed it, Mr. Richard. Were it not for my poor child—and poor Roberts, too, I would certainly endeavor to procure a situation as a governess—and Roberts, he might go into lodgings again, since it seems I cannot, with all my skill and economy, manage that we should live within our income—and it is worse than that with us! Oh, I assure you, it has almost broken my heart! Mr. Roberts is short of Mr. Taylor's cash. It is shocking! his probity may be doubted; and he is in fearful temper this morning. I dread his

coming back." Maria could no longer restrain her tears. I was gratified by her confidence in me, pleased that Roberts had at once told her the circumstance so important to them both; but she had another motive for confiding in me. "I have a great favor to beg of you: I have a few trinkets," she said; "presents and gifts of one kind or another. It would be such a kindness in you to dispose of them for me, that I may help Roberts so far. There is the piano, too, and other *useless things*"—she looked round the room—"they would not bring much, but everything helps."

I knew, for I had seen it, that Maria had at least the full value for her *suit* of pearls and other ornaments; but principle and generous affection were far more powerful than vanity. Roberts had peremptorily refused to dispose of her trinkets; he was even affronted by the proposal, and she depended on me, and urged me; and with the case in my pocket I left her, and encountered her husband at the corner of the street.

"You have been calling for your favorite, Mrs. Greene?" said Roberts.

"No; I have spent the last hour with my more interesting favorite, Mrs. Roberts."

Mr. Roberts looked confused and uneasy. He remembered in what humor he had left his wife in the morning. "Then, sir, you have spent your time with a very silly, incorrigible woman: but this, I suppose, is no news to you; you see how all reason and advice are thrown away upon her."

These were high airs, indeed, for Mr. George to give himself! he who deserved at least a full half share of the common blame.

"Pardon me if I see no such thing; but quite the reverse. To me, Mrs. Roberts appears an uncommonly clever young woman—generous, candid, and well-principled—and most anxious to do her duty, so far as she understands it. All she requires is, forbearance, kindness, and gentle guidance, till her rapidly increasing knowledge is matured into experience."

The honeymoon was long past, and Roberts, as I have said, in the crisis when young husbands are the most susceptible of jealousy for their many privileges and powers; yet was Roberts much better pleased with my opinion of his wife, than if it had coincided with that which he had expressed. I took his arm, and we walked back towards his house. One of the peculiar blessings of an old bachelor and slender annuitant like myself, is the power of saying, when the salvation of a friend demands frankness, things that it would frighten a sensible man with a wife and six small children, to dream of uttering. Some of these startling things I now whispered in the ear of George Roberts and his wife. They were young, healthy, virtuous, sincerely attached to each other, better endowed with world's goods than on the average are four-fifths of their fellow-citizens—why should they not be happy? "How great a blessing were it," said George, sensibly, "if young women were trained to the *utilities*, and *comforts*, and *solidities*, like Rachel Greene, and less to the *refinements* of life, like Maria."

Now, though Maria was more my favorite at present, from compassionate interest, and though custom had stamped many of her little pretty ways and affectations with the name of refinement, was she in reality more truly refined, farther removed from the vulgarities and the assumptions of affect-

tation, than Rachel Greene, the amiable Quakeress, with whom she was contrasted!

"If Maria had been taught a little plain housewifery, instead of so much music," continued sensible George, "how much better for us all now!"

Yet Maria had not been taught so very much music. She had not, at least, acquired more than any girl might easily learn between seven and seventeen, and practice while it was desirable, without interfering, in the least, with her domestic duties, where music is kept as an elegant recreation, not held as a means of coquetry and display.

"If we could be carded through each other," said Maria, half laughing.

"Ay, Rachel's substance, with Maria's gloss and color, would be a first-rate fabric. I think I see it in my fancy-loom. I shall never despair of *woman* in the general, nor of Maria in particular."

I took my leave, inviting myself back to tea, at which time, in a regular family-council, I deposited the price of Maria's pearls in her husband's hands. He was half-offended, half-vexed. I have ever noted that men have much less true magnanimity and simple greatness, on such occasions, than women. He was at first ashamed and angry at being obliged to his own wife; but better feelings prevailed. We had a long, frank, and therefore a most satisfactory explanation. The *limited income* was the first head of discourse. I heard George expatiate on that with some impatience. "Your income is, at least, more, by three times, than the richest rector in England affords to his drudge curate—twice or near three times more than the income of two thirds of our half-pay officers, with considerable perquisites in addition."

"These have undone me," said Roberts. "Trusting to these, I forbore to be so explicit with my wife as I ought to have been. I trusted to contingencies. I did not choose to seem churlish and sordid, by perpetual interference with her arrangements, for I read all her anxiety to do right."

"Fluctuating income and sanguine calculation have ruined thousands," was my *sensible*, though rather commonplace rejoinder.

George Roberts needed not my directions, now that his good sense was roused. His wife's generous sacrifice, for so he was pleased to call it, though neither Maria nor myself would allow the phrase, and the sale of nearly all the movables of the *blue room*, enabled him next day to clear scores with my kind brother, Mr. James Taylor, who now said there was no such pressing haste, as Mr. Roberts, with his *first year's outlay*, might need a little indulgence.

On the same day Maria could say she at last had a house of her own to *live in*, almost as comfortable as Rachel Greene's.

Jane and she had indeed worked hard to have all right before Roberts came home, to dine in comfort; bringing myself along with him, after the completion of our *blue sale*, to share the very small but sufficient juicy stew of meat with vegetables and apple-pasty, which formed the dinner. After dinner, while she filled my tall Teniers-looking glass with amber-colored creaming Scottish ale, Maria said, with a more elevated spirit than I had ever seen her assume—with an air of noble simplicity, "Drink to the happy woman, my excellent friend, whose husband owes no man a shilling

—and to her who resolves that, so far as depends upon her economy and management, he never shall."

I never accepted pledge with more sincere pleasure in all my life.

"But what will Mrs. Pantague say?" said Roberts, laughing.

"Exquisite Constantia!" mimicked Maria, archly, as she sipped the cream off her ale; and the merriest young natural laugh rang out that I had ever heard her indulge. My fears for the peace of the Roberts family—for their prosperity and happiness—were laid forever. The spell of fashion was broken—the demon, Mrs. Pantague, exorcised; and Maria was one more proof that a well-principled character, an intelligent and active mind, when its energy is roused, will be found in every circumstance equal to the common duties of life. She became an excellent housewife.

There were few of the many houses at which "I dropt in," where the fireside now looked so snug and sunny as that of Mrs. Roberts. Even "baby," my old antipathy, now well managed and healthy, had grown a fat, good-humored, smiling, *conversable* fellow. Maria once again ventured to *take in* the newspapers at the usual expense, and never grudged to pay for as much reading as Roberts or myself chose to give her at what she called the mother's hours of work—from seven to ten in the evening.

Towards the end of the year I was again consulted by my sagacious brother, James.

"What do you think, Dick; that old fox, Martin of Chancery Lane, is trying to steal George Roberts from me—the man who knows all my affairs better than myself—the boy I brought up, whom I trust as my right hand. Don't you think, Dick, I might do worse, now that I am growing lazy and fond of the farm, than give so steady a fellow as Roberts some sort of share?"

"There was an obstacle about his arrears," was my sly reply, "Was there not? He either over-drew, or was *behind in his cash*."

Mr. James Taylor could remember nothing of it; and there was no affectation, much less insincerity, in his oblivion on those points—which inclines me to think that when statesmen sometimes totally forget their early professions, they may not be so hypocritical as people imagine.

"Is there anything you think Mrs. Roberts would like at this Christmas season? You are a great friend of hers, I find—and she has considerable influence with Roberts."

"My brother wished to show you some substantial mark of his good-will," said I to Maria, when, two hours afterwards, I went to her house. "I have counselled him to assist Roberts in purchasing the lease of the house next your friend Rachel Greene's new abode. He has money to lend at a very low rate of interest; and as you often truly tell me, rent is such an *eat-em, (item)* as the Scots say, in a fixed income. On your own personal account, instead of *gaud* or *toy*, I accepted only of this." And I called in the boy who bore the guitar I had chosen and purchased for her as my brother's gift. Maria was not too proud to feel warmly, to seem highly gratified; and in six weeks afterwards I partook of her Third Christmas Dinner, in her new house.

"I am afraid to venture," said she beforehand, "strong as is still the recollection of all my mortifications, and disgraces, and miserable failure of last

year; but with the treasure you have given me in poor Sally Owen, who is the most neat, industrious, and excellent servant-of-all-work I have ever seen, I think I must venture, since Roberts insists we can now, by better economy and sense, afford to see our *real* friends, and a pleasant acquaintance too. But I grieve to tease Sally with a party, who still pines so about her little girl, and that *scamp* of a husband of hers."

"The sooner she is roused from these recollections the better."

I could think with no patience of Mr. Hardy, the marvellous boot-closer, who, because he could earn very great wages, contented himself with half; wasted that pittance in riot; starved, *beat*, broke the heart of his uncomplaining wife; whom I could sometimes have beaten also in anger of her foolish forbearance, and really tender but senseless attachment to this worthless fellow, who had, I was assured by her, "so good and kind a heart when he kept sober."

I cannot comprehend the infatuation of women. After the boot-closer had behaved as ill as mechanic or man could do, squandered all their little furniture, and the fruits of Sally's early savings, he ran off in a drunken frolic to Liverpool. She was compelled, to avoid starvation, to take service, and let her child go to the work-house. I thought myself fortunate, for both their sakes, in recommending her to Mrs. Roberts. For ten months the boot-closer was not once heard of, and Sally looked a forlorn Penelope. He had gone to Dublin, and thence to Belfast, where we first heard of him in the hospital, ill of typhus. He should have had my leave to take time to recover. But what an unnatural monster did my fair friends, Mrs. Roberts, Rachel Greene, and Nurse Wilks imagine me, when I suggested the propriety of letting Mr. Hardy quietly lay his restless bones in Ireland, without disturbing his wife.

Blessings upon their kind, simple hearts!

He spoke to them who never had a *husband*!

Would I keep Sally from her duty?

Poor men's wives have often very hard conjugal duties compared with those of the ladies of the rich. Sally tied up her few remaining clothes, with my recommendatory letter to a very particular old favorite of mine, who had settled in Ireland, (whom I may yet introduce to my readers, by her maiden name of Mary Anne,) kissed her child, and trudged away to walk a couple of stages ere she took the top of the Liverpool coach, on her way to her sick husband. It was six weeks before she returned to us, thin as a greyhound, much dejected, and looking twenty years older; but all the women concerned assured me Sally had done her duty; for the extraordinary boot-closer said on his death-bed, that he sincerely repented of his unkindness; and he sent his blessing to his child, whom he solemnly charged Sally to bring up in the fear of God.

Excellent, consistent man! for his sake Sally resolved she never would make a second choice. With her wages, and a little help, she could now take her child from the work-house, and send it to the country to nurse; and as soon as it was five years old, Mrs. Roberts determined to fetch the little girl home to be first a comfort, and then a help to its subdued mother. This prospect gave a zeal and warmth to poor Sally's services which no other motive could have furnished. She was per-

mitted to go to see her child on a Sunday. Poor Sally Owen could not now have been known for the blithe, light-hearted, ruddy Welsh girl, who wont to sing like a bird all day at her work. She had plenty of work still; but her mistress was kind and sisterly, and in her little girl Sally had something dearly to love; so that, upon the whole, I believe, the widow of the accomplished boot-closer, who starved his family, and killed himself because he could make double wages when he chose to keep sober, (I do confess a spite at the man,) was upon the whole in fully as felicitous circumstances as ever his wife had been;—though I durst not say so.

From Mrs. Roberts' Third Christmas Dinner, I walked home part of the way with my brother, Mr. Sullivan, and Plague Madox, whom I saw to the Haymarket, near where he lodged.

"Very pleasant party," said the old buck, for the third time, as we stood to take leave. "Remarkably well-dressed, well-served dinner; so good, and *enough* only—no John Bull load. She is an excellent valuable creature, that Sally Owen. I suppose the mutton was Welsh. Really Roberts' wife looks a hundred per cent. better since she plumped out a little, and dressed in that neat, plain way. Last year—I have not seen her since—she looked so fretful, tawdry, and haggard, that, upon my honor, I was concerned for Roberts. I don't think I would have visited them again, if Mrs. James had not hinted at decided improvement. I am to dine at your brother's charming house to-morrow. Everything delightful there, though I don't think the young ladies are better guitarists than Mrs. Roberts."

"The difference being that Mrs. Roberts is a tolerable performer on that charming unpretending instrument, which links the romance of sunny lands to a quiet English fireside, while my nieces—"

"Charming girls!" But the wind set in most cuttingly. "Eliza reminds me most of Abingdon of any lady I know." This was unintelligibly breathed through ten folds of a Barcelona handkerchief, and Madox went off, hating the east wind as much as he loved a pleasant dinner party, with all its accompaniments—guitar music included.

I could not forbear calling to congratulate Mrs. Roberts next day. "Always at home to you, sir," said smiling Sally Owen to me, "though mistress has been so busy putting things to rights."—"Quite done now, though," cried Maria, opening the parlor door; "I know your knock so well." It is pleasant to have friends, particularly female friends, that know one's knock. I like to hear it.

"Your triumph is complete, Mrs. Roberts!" I said. "Plague Madox has pronounced you perfect! But you need never hope for the Pantague suffrage."

Maria was still laughing heartily, when Sally brought in a packet. I knew its contents before it was opened, for I had seen Madox purchase that morning, at an auction, a *whole lot* of cheap guitar music. No man in London could exchange this sort of notes for solid dinners more knowingly than my old acquaintance. I had foreseen that Mrs. Roberts, now fairly ranked among the comfortable dinner-giving women, was to have her share of the purchase.

"Confirmation strong!" cried Maria, laughingly holding out to me the printed sheet of music,

inscribed in his best hand, "With Mr. Madox's compliments to Mrs. George Roberts." "But in spite of this polite note, and 'Zara's Ear-rings' to boot," said Maria, "a charming bribe, no doubt, I do think a young couple like Roberts and myself, beginning life, may find, if we beat up diligently the highways and hedges, more suitable or desirable family guests than the Plague Madoxes of society. I have imbibed your own

notions and Rachel Greene's of that in which true hospitality consists. They exclude the regular *diners-out*."

I must some day write the biography of my friend, Plague Madox; who had dined out for nearly thirty years upon the reputation of a farce, damned forty years ago, and three anecdotes of Sheridan; and this, though the ladies where he visited detested him with one accord.

THE FRENCH IN CHINA.

We find in the *Courrier des Etats Unis* a letter extracted from the *Rhone*, a journal published at Lyons, (France,) which contains the fullest, and, apparently, the most authentic account we have seen of the proceedings of the French Embassy in China, and which we translate as follows, preserving the French spelling of the proper names:—

"Ki-ing, Imperial Commissioner, Vice Roy of Canton, prince and relative of the emperor, arrived at Macao, the afternoon of the 29th of September. He rested the 30th, and then came the next day in great pomp to visit the Ambassador of France, to whose dwelling he had the evening before sent his portrait of the natural size. His *cortège* was opened with 150 lancers on foot, and closed by Manchu cavalry, armed with bows and sabres, but very ill-mounted. We were all in grand uniform, at a heat of 32 degrees, (*Reaum.*) At this first interview, manifestations of consideration and friendship were exchanged in profession. Ki-ing and M. de Lagrenée embraced one another several times.

"The next day but one, (October 3,) at 1 o'clock P. M., we went to return to the Imperial commissioner the visit with which he had honored us. Ki-ing was lodged in the pagoda of the village of Wang-hia, at a short distance from Macao. Besides the gentlemen of the Embassy, M. de Lagrenée had admitted in his *cortège* a dozen officers of the French squadron.

"We were all in sedan chairs. After reciprocal compliments, Ki-ing took M. de Lagrenée by the hand, and we entered into the dining hall, where there awaited us a splendid festival, served in the Chinese taste, in the midst of flowers and foliage. Those who arranged the banquet had taken care to place knives and forks by the side of the Chinese chop-sticks; but, like men who knew the world, we made use of chop-sticks almost exclusively. The wines of Champagne, Ronssillon, Porte, Madeira, circulated at the table.

"We began with sweetmeats; after which was presented to each guest a cake having the form of four Chinese words, which signified: 'Ten thousand years' friendship between France and China.' This wish was received with plaudits. Then commenced the drinking healths, which succeeded each other so fast as seemingly to threaten ours.

"Ki-ing had at his left M. de Lagrenée, at his right Rear-Admiral Cécille. Howen, Treasurer General of the Province of Canton and Mandarin of the first class, was seated at the left of our Ambassador; and three other Mandarins had places at the table, namely: Tonlin, one of the forty academicians of Peking; Tchao, a large and fat Manchu of the figure of a brigadier of the municipal guard, and sub-prefect of Canton; Pan-thin-chen-tin-oua, honorary Mandarin, son of an old hong merchant of Canton, who left to him immense wealth. I happened to be placed between the two last. As to the academician, he was

placed at the other extremity of the table, and he gave himself up so heartily to pledging healths that about the middle of the dinner he became intoxicated, and it was necessary to carry him out. This episode gave rise to a quantity of the most grotesque scenes.

"Ki-ing was very animated. He invited M. de Lagrenée to drink; and then, when he had emptied his glass, he held it bottom up, to show that he had drunk it off, and drained it into the glasses of his neighbors, who did the same in return. A great act of politeness with the Chinese is to take from the table a morsel of something in the chop-sticks of the country, and to place it in the mouth of the person to whom it is desired to do honor. Ki-ing did this several times to M. de Lagrenée and to Admiral Cécille; my neighbor, the Manchu, also gave me this testimony of consideration and friendship.

"They served, during the repast, bird's nests, sea-worms, sharks' fins, fish-maws, and toad-stools, &c., all very good things, I assure you, seasoned with Porte and Champagne, which our hosts served up with the most engaging attention.

"My neighbor, the Manchu, showed me incessantly his glass full and empty, in sign of provocation; and thus, from yellow as it was in its natural condition, his complexion assumed a purple color of the most brilliant hue.

"Before leaving the table we had placed before us Manchu tea, bitter, and without sugar. Then we recurred to protestations of the warmest friendship. 'China and France are now but one!' said Ki-ing. Finally, after some hours of hilarity, we separated enchanted with one another. We returned to Macao.

"We shall leave in two days for Batavia, but we propose to return here in the month of April. It is only at that time that the treaty can be finally concluded. Everything leads us to expect that it will be favorable to our commerce. The inclinations of the Chinese government are excellent."

It appears by this letter that the statement recently made of a treaty having been actually concluded by the French was premature. Recent advices from China report the French Embassy as having left Macao, and being at the last advices at Hong-Kong.—*National Intelligencer*.

PREPARATION OF COFFEE.—It is a fact well known in Prague, that the water of the wells in that town is better adapted for use in making coffee than the river water; comparative analyses of the water indicate that this depends on the carbonate of soda contained in the former. Pleischl found this opinion corroborated by the fact, that a small quantity of the salt added to coffee improves its flavor, and advises consequently the addition of 43 grains of the pure carbonate to each pound of roasted coffee, as an improvement to the flavor, and also to the curative effect of this beverage, as it neutralizes the acid contained in the infusion.—*Pharmaceuti- cal Journal*.

From the Protestant Churchman.

CHURCH BELLS IN THE DESERT.

"The sun growing fiercer and fiercer, shone down more mightily now, than ever on me he shone before; and as I dropped my head under his fire, and closed my eyes against the glare that surrounded me, I slowly fell asleep, for how many minutes or moments I cannot tell; but after awhile I was gently awakened by a peal of church bells—my native bells—the innocent bells of Marlen that never before sent forth their music beyond the Blaygon hills. I roused myself and drew aside the silk that covered my eyes, and plunged my bare face into the light. Then, at least, I was well enough awakened; but still those old Marlen bells rung on, and not ringing for joy, but properly, prosily, steadily, merrily ringing 'for church.' After awhile the sound died away slowly; it happened that neither I nor any of my party had a watch by which to measure the exact time of its lasting, but it seemed to me that about ten minutes had passed before the bells ceased."—*Edthen, or traces of Travel brought home from the East, page 273.*

BENEATH the fervid eastern sky,
Far from his native land,
A way-worn man, at noon of day,
Lay dreaming on the sand:—
Around him, like a burning sea,
The trackless desert spread;
Beneath him was the torrid earth,
The brazen sky o'erhead.

Sweet visions of his island-home,
Beyond the distant main,
Like vernal landscapes, filled his soul,
And sooth'd his racking pain.
The green old hills—the pleasant fields,
The summer groves and streams,
'Neath fancy's sleepless eye were spread,
And flash'd through all his dreams.

He wakes;—and on his waking ear,
What joyous music swells;
He hears the chimes—the glorious chimes,
Of his own parish bells.
Peal after peal, distinct and clear,
Through the hush'd air they roll,
Bringing home's thousand memories,
Afresh upon his soul.

They mind him of the Sunday groups,
Within the church-yard shade;
He sees again the pictured light
On aisle and transept laid;
The organ's soft prelude strain
Floats on the desert air,
With solemn Eucharistic hymn,
And voice of holy prayer.

The sweet delusion lingers yet,
Though fiercely still on high
The fiery sun-heat, wave on wave,
Sweeps over all the sky:—
The sweet delusion lingers yet,
Though still the sand wastes glow
Beneath the scorching atmosphere
That withers all below.

O thus, amid the arid waste
Through which our journey lies,
When fiery streams of woe seem poured
From fierce, unkindly skies,
When o'er the desert-sands of time,
In life's hot race we toil,
And every footstep, track'd in blood,
Seems burnt upon the soil;—

How sweet to catch the solemn chimes
Of holy hope and cheer,
Which oft from heav'n seem pealing down
On faith's attentive ear;
Echoes as 't were of Sabbath bells
Forever ringing on,
Where saints and angels worship God,
Around th' eternal throne.

Echoes of those sweet chimes that roll
O'er all the heavenly plains,
Responsive to the seraph's songs,
And high angelic strains;
Borne on—borne on unceasingly,
Where life's immortal streams,
'Mid the green pastures of the Lord,
Roll in love's noontide beams.

Astoria, L. I.

J. W. B.

WE ARE GROWING OLD.

WE are growing old—how the thought will rise
When a glance is backward cast
On some long remembered spot that lies
In the silence of the past:
It may be the shrine of our early vows,
Or the tomb of early tears;
But it seems like a far-off isle to us,
In the stormy sea of years.
Oh, wide and wild are the waves that part
Our steps from its greenness now,
And we miss the joy of many a heart,
And the light of many a brow;
For deep o'er many a stately bark
Have the whelming billows rolled,
That steered with us from that early mark—
Oh, friends, we are growing old.
Old in the dimness and the dust
Of our daily toils and cares,
Old in the wrecks of love and trust
Which our burdened memory bears.
Each form may wear to the passing gaze
The bloom of life's freshness yet,
And beams may brighten our latter days,
Which the morning never met.
But oh the changes we have seen,
In the far and winding way;
The graves in our path that have grown green,
And the locks that have grown gray!
The winters still on our own may spare
The sable or the gold:
But we saw their snows upon brighter hair—
And, friends, we are growing old.
We have gained the world's cold wisdom now,
We have learned to pause and fear;
But where are the living founts whose flow
Was a joy of heart to hear?
We have won the wealth of many a clime,
And the lore of many a page;
But where is the hope that saw in time
But its boundless heritage?
Will it come again when the violet wakes,
And the woods their youth renew?
We have stood in the light of sunny brakes,
Where the bloom was deep and blue;
And our souls might joy in the spring-time then,
But the joy was faint and cold,
For it ne'er could give us the youth again
Of hearts that are growing old.

Stranorlar.

C O R R E S P O N D E N C E .

WHAT a contrast is shown in our biographical articles this week! And yet we hope that all were doing good in their generation. Poor Lancaster, in his excitable zeal for others, he neglected that indispensable preliminary to great usefulness—a sufficient provision for the necessities of the day to secure to him what Burns calls

“the glorious privilege
Of being independent.”

For this purpose it is not much that is needed—but it is necessary to keep out of *debt*. This is urged by St. Paul, and is therefore a christian duty; and so far as we can judge, Mr. Lancaster fell into it from his desire to minister to others. But even such an impulse should not be unrestrained—and we recur to Burns again:

“Prudent, cautious self-control
Is Wisdom's root.”

Our last number contained as great a contrast between Bunyan and Dalton.

The “English Gentleman” is respectfully submitted to our politicians—no! they are hopeless!—to young men who aspire to statesmanship—as containing an important lesson.

The Tory Fraser gives in its adhesion, cautiously enough, to the great change which is making in British policy.

We have received files of the Polynesian and of the Liberia Herald. The latter contains matter from the Living Age, and we hope we may be able to get some good notices of matters showing the state and progress of that colony. At present, we have not had time to look over either file, and make use of a summary on the Sandwich Islands, from that well informed, judicious, gentlemanly paper, the National Intelligencer.

Chocolate, Prussic Acid, and French Cookery have accidentally come together in our pages.

It will be seen that our searchers for Captain

Kidd's treasure, are kept in countenance by similar companies in England.

It is rumored that the British minister, “near” the President, is authorized to make a treaty to favor a great increase of trade between England and her “daughter.” Such a negotiation will have the best wishes of the friends of human kind.

The possible discoveries of Lord Rosse's great Telescope, we suffer our hopes to dwell upon with great pleasure. To see more and more of the works of the Great Architect, is one of the highest delights even of the present life, during which we see “through a glass darkly.”

Spectator, 22 Feb.

O U R S T E A M N A V Y .

GOVERNMENT are beginning to find out that steam-navigation has destroyed the insular character of Britain. Troops can be transported in steam-vessels with greater despatch, cheapness, and certainty, than even by a railway. The destruction of a railway at any one point would put a stop to all operations based on its integrity; but the loss of one or two steamers would not materially affect the operations of a squadron. The sea is Nature's railway, and cannot be broken up and interrupted like the artificial substitutes of man's invention. Steam has bridged the waters with flying bridges, movable to any point, resting on every port—flying pontoons, by which Inverness may be threatened one day and Hull the next. Steam has conquered storms and tides, and given naval operations a certainty they did not formerly possess. With every improvement in steam-navigation the coasts of Great Britain will become more accessible to attack from every maritime power between the Cattegat and Cape Finisterre.

The same cause is changing the requirements of our navy. Instead of brave and experienced seamen, equally brave mechanical engineers and marine artillerymen are needed. The issue of the next naval war will depend upon the steam-engine and Paixhans gun: the men to decide it will not be those who can “hand, reef, and steer”

best, but those who can best work an engine and fire an eighty-four pounder with the precision of a rifle. This new triumph of mind over matter will change modern warfare, as much as the invention of gunpowder did the ancient. Sea-fights will become short, sharp, and decisive—their results capable of being mathematically demonstrated beforehand. Less blood will be shed on the whole; but what is shed will be condensed into an epitome of agony.

The right of search treaties keep war always hanging by a hair over our heads. If the French or the English war party were to gain the ascendant, (and we dread the fanatics of Exeter Hall more than the Prince De Joinville and La Jeune France,) peace would not be worth a week's purchase. Let two hot-headed French and English naval officers on the coast of Africa quarrel about a suspected slaver and settle the dispute by an exchange of shots, and away would go all security for peace. Who would in that case continue to live at Brighton or Hastings, now that Britain is almost more exposed to invasion and predatory attacks than any continental state? What a change the first shot fired between England and France would make in the value of property on our southern and eastern coasts!

Government are now awaking to the urgent necessity for adopting new provisions of defence against a new mode of attack: a subject brought before the public by a correspondent of this journal three years ago. Government have been trifling with the subject in dilettante fashion ever since. Nearly three millions of the public money has been spent during the last three years in building, equipping, and hiring steam-vessels; and yet, we are well assured, there is not at this moment one steam-vessel in the naval service of England, in commission or ready to be commissioned, that could make the passage under steam between Plymouth and New York. During the last ten years, not less than five or six millions has been spent in fitting the navy with steam-vessels, and yet there is no instance on record of one of her Majesty's steam-vessels crossing the Atlantic under steam. There is not in commission a steamer capable of steaming three thousand nautical miles. The Admiralty have steamers in China and America, but they did not get there by steam. The Royal Navy could not produce one steamer fit to carry Sir Charles Bagot, or Lord Ashburton, or Sir Charles Metcalfe, to his destination.

The admiralty orators in Parliament tell us that such or such a vessel has more power than the largest French steamer. This is not to the purpose: let them tell us what the vessel can do; let them give facts of distances run under steam, and the time in which the runs were made. Without this, returns of the horse-power of the steam navy are only calculated to mislead. The capabilities of the admiralty steamers are never tested in a fair practical way. Nothing is heard beyond the puffing of the performances of one or other of them on her trial at Long Reach. The Lucifer or the Pluto is reported to steam so many miles per hour on the river Thames, and no more is heard of her. Had the trial-trip been a run to Halifax in the winter, a very different class of steamers would now be wearing her Majesty's pendant.

Two causes, combined with the dilettante spirit at head-quarters, have mainly contributed to render ineffectual the great expense incurred of late years for the creation of a steam navy. The first is,

the system adopted by the Admiralty of dividing the responsibility between the builder of the vessel and the engineer. The second is, the system of contracting for the conveyance of the mails to America and to the East and West Indies.

By dividing the responsibility between the builder and engineer, no one official person was made answerable for the result. If the vessel disappointed expectation, the builder threw the blame on the engines, and the engineer on the hull. The contractor for a steamer ought to be responsible for the hull, engines, and the whole equipment. The hull and the engine of a steamer are its body and soul: unless they harmonize, there can be no efficiency. The system pursued by the Admiralty has precluded unity of design; and the result has been, the creation of a class of steamers combining the qualities of a bad sailing-ship and a useless steam-vessel. A new system is required: the head of the steam department of the Admiralty ought to be responsible for the efficiency of a new steamer in every way, as the surveyor of the navy is for the construction of his ships.

The system of contracts with private companies or individuals for the conveyance of the mails has done a great deal to suppress competition and prevent improvement in steam-navigation. By such contracts, government tie themselves to the preferred party for terms of years. During these periods, they are precluded from availing themselves of better vessels belonging to other parties. They make it the interest of the contractors not to construct vessels on an improved model, lest they should injure the character of their old ones. As long as £500,000 per annum is paid to contractors for perpetuating the present model of steamers, they will make no improvements. A curious illustration of this has just occurred. Iron is generally superseding wood in the construction of steam-vessels: last year, twenty-four iron steamers were built in the Clyde, and only one of wood: the solitary wooden vessel was for a company who knew that by building an iron one they would lower the estimation of their wooden fleet.

Two examples of the practical consequences of the way in which the Admiralty has gone to work may be cited. About twenty years ago, a description of engine called the "direct action engine" was invented: it has been condemned, and at present no private individual would take the gift of one, unless he were guaranteed from all competition: yet what are called our first-class steam-frigates are fitted with engines of this description. Again: screw-propelling is yet in its infancy; no vessel propelled by a screw has yet crossed the Atlantic; the screw is not employed by a single passenger-vessel in the kingdom: the Admiralty have built and equipped a vessel for the express purpose of trying experiments on screw-propulsion; and, after trying it several times on the Thames, and once between the Thames and Portsmouth, they have actually begun to construct ten large steam-vessels propelled by the screw. The performances of the Rattler have doubtless been satisfactory as far as she has been tried; but are such fresh-water and fair-weather experiments as she has been subjected to, sufficient to warrant the great expense of building ten ships on the strength of them?

More information on these matters is evidently wanted. We have said enough to show the national importance of the subject.

From Fraser's Magazine.

A PASSAGE IN THE LIVES OF RUBENS AND REMBRANDT.

On the evening of All Saints' Day, in the year 16—a little party of travellers were wending their weary way along the rugged highroad that leads from Laege through Juliers to the old city of Cologne. Of all nights of the year the superstitious feelings of the Flemish and the Walloons surround that of the 1st of November with the greatest terrors. What the Walpurgisnacht is to the Germans, this horrible night is to the natives of Flanders, Brabant, and the banks of the Moselle. The "hornpipes, jigs, strathspeys, and reels," which the warlocks and witches were dancing in old Alloway Kirk before jolly Tam O'Shanter, were as child's play when compared with the supernatural and eldritch performances on All Saints' night in the regions mentioned. The dead at midnight arise from their rank sepulchres, and, shrouded in their reeking grave-clothes, haunt the abodes of those whom, while living, they had injured, in the hope of obtaining from their lips a prayer for their future repose. Then the sorcerer allowed most powerfully to use his abominable arts, and the witch her foulest incantations. Then, for the space of twelve hours, the angel Gabriel raises his foot, beneath which lies groaning the captive demon, who, rising with his accursed malice, straightway proceeds to scatter his deadly temptations among the weak sons of men. Then the air teems with hostile spirits, and the earth engenders all that is vile and filthy.

Not a creature was to be seen moving along the road to break the dreadful solitude surrounding the small party of travellers, which consisted of a man and his youthful wife, a little boy, and a girl so young that the father was obliged to carry her in his arms. The snow lay thick on the ground and was falling fast, so that it was with difficulty that they kept along their path.

"Margarita," at length said the husband, with feeble tones, and in Italian, "it is impossible to proceed farther, thy slender frame is exhausted. Cover thyself and the little girl with my cloak, and lie down in this sheltered hollow. I will endeavor to keep animation in our Antonio's limbs."

The wife followed her husband's directions, and the party for some time lay down in silence and sadness. But the snow fell more thickly, the wind blew more sharply, and the cold became more and more intense. The husband arose and found his wife speechless, thoroughly benumbed, and heavy with sleep. Her death was certain, unless she could be aroused. He shook her and called her by every endearing name, but in vain. He raised her in his arms and tried to make her walk; but she reeled and fell down, and in her fall her infant daughter escaped from her arms, and received a wound on its forehead. He picked up the crying child and tried to stanch the blood.

"Antonio," said the unhappy man, in a tone of despair, "creep close to thy mother's side, and place over her this additional covering, while I carry thy sister with me and look about for assistance."

He doffed his coat and placed it, with the cloak, over his half-dead wife and his son. Presently the sound of a distant clock came slowly echoing through the lazy and infected air. The husband for a moment listened; he knew the sound was wafted from the church-towers of Cologne, which

could not be far distant, and he darted forward, bearing his wounded infant in his arms.

He ran unceasingly, and reached the city gate, round which were lounging a number of Spanish soldiers, and rushing up to a small group, he eagerly asked the way to the house of Master Rembrandt. His request was couched in bad Flemish intermixed with Italian. This unintelligible jargon, added to his half-naked appearance and anxious looks, produced loud laughter from the soldiery, who bantered him in no measured terms. They had never heard of such an individual.

"Master Rembrandt!" cried one; "he lives just by—at the other end of the town. Take every turning you come to, and you are sure to be right."

"Master Rembrandt!" said a second. "Go straight ahead and follow your nose, and you cannot fail to get to the old curmudgeon's house."

"Master Rembrandt!" exclaimed a third. "Turn to the right, and after that to the left, and then go right forward round the corner and across the churchyard, and you will see a large house without door or windows; you must then drop down the chimney, and you will be sure to see your friend seated at his fire."

All this was followed by a round of laughter.

"For mercy's sake!" faltered forth the poor distracted traveller, "show me the way to the house of my dying wife's uncle, Master Rembrandt."

Just at that moment up came a little, short, humpbacked individual, a tailor by trade, who held a lantern in his hand. The police regulations of Cologne directed that every inhabitant should carry a lantern after nightfall. The little man was an Italian himself, and had, from his broken accents, recognized a countryman in the stranger. The tailor's heart melted at the sight of the wretched father with the tender infant in his arms.

"Come along," said Master Nicholas Borruelo, the humpback, "I'll show you the way to Master Rembrandt's, though he will never at this late hour open his door to any human being, especially on the night of All Saints. However, we'll try; so come along, friend."

"But my wife and my poor boy, what will become of them? They lie without the city, and are dying. If I lose much more time it will be too late," exclaimed the agonized stranger.

"Verily, friend," answered the humpback, "if thou expectest aught of relief from the charity of Master Rembrandt, thou laborest under a woeful error, and their loss is but too certain. He would not give a doit to save his own brother from the jaws of death. It were, believe me, much better to entreat some of the soldiers to go with us to thy wife and child and assist us to conduct them into the city. They can be carried to my lodging; though the room is but small, and though I am myself poor, still, with the blessing of God, they shall not, on this cold and comfortless night, stand in need of assistance!"

The stranger readily assented, and the little tailor forthwith accosted some of the soldiers, and in a sorry Flemish *patois* explained to them his companion's miserable condition. A kind-hearted drummer caught the child from the stranger's arms and took it into the guard-house before a rousing fire, while four soldiers, with their sergeant's permission, lighted torches, and accompanied the husband and the tailor through the city gate. It was with difficulty that the party could

keep pace with the eager stranger, who ran along shouting the names of Margarita and Antonio. But the snow was falling more thickly than ever, and the wind had arisen into much louder gusts. It was impossible that the sufferers could hear his calls. A sudden lull of the tempest, however, enabled them to hear a feeble cry, and then they discovered the ravine where the wife and boy were lying almost buried under a drift of snow. Had they tarried a few moments longer they would certainly have been too late. The tailor entreated the soldiers to bear along tenderly the speechless wife, while he took young Antonio under his own protection; and as they entered the city he desired the party to proceed to the narrow street which contained his abode. The soldiers the more readily complied since the distance was not very far from the guard-house. As they were going along, Nicholas Borruelo, by dint of hard questioning, discovered that the stranger's name was Francesco Netcelli; that he was a native of Venice; that he had made a runaway marriage with the daughter of Rembrandt's sister, who had, contrary to the wishes of her family, chosen a poor Italian gentleman; and that he himself was by profession a painter. This was at a period when a successful painter easily commanded, like a potentate, the ready homage of mankind, and painting, consequently, had many more enthusiastic, self-denying votaries than she reckons in the present dull, prosaic, and degenerate days.

The tailor introduced the poor travellers and two children into his room, and, after having the wife and infant daughter laid upon his bed, he dismissed the soldiers with many thanks, and, blowing up the fire, placed seats for Netcelli and his boy Antonio. Netcelli sank into his seat, and gazed motionless and unmeaningly at the fire, like one in a trance. The boy appeared also in a stupor. Nicholas Borruelo bustled about, now trying to arouse the husband, now divesting the wife of her wet garments and covering her with the warmest clothing his poor lodging could afford, having previously warmed it before his fire. The former was stupified and dead to his calls and entreaties; the latter was so benumbed that she was motionless and rigid as marble. It might be the cold which had operated upon the young man's limbs, it might be despair at his desolate position which was wringing his heart and had made him speechless. Nicholas Borruelo rummaged in a cupboard, and drew forth from its extremity an old-fashioned bottle, carefully corked up, containing some rare and exquisite brandy. This was carefully kept as a *bonne bouche* for himself, but his generous heart made him lay aside all thoughts of his own comfort, although an audible sigh escaped him as he poured some of the precious liquor upon a piece of rag, with which he carefully rubbed the lips, face and hands, of the senseless lady. For a long time he labored in vain; but, at length, she gradually opened her eyes, and, stretching forth her arms, in a faint voice demanded her children.

"Here they are, signora," exclaimed little humpbacked Borruelo; "here they are, all warm and comfortable."

Then, going up to Netcelli, he slapped him on the back, and told him to be a man. But seeing him still gazing vacantly, like one demented, he seized his bottle with the precious contents, poured out a glass, and desired him to drink it off, for that it would create new life under the very ribs of death. Still the young man did not move.

Upon which the tailor, somewhat losing patience, put the glass to his lips, and, with a slight struggle, fairly forced the contents down his throat. The liquor operated like magic. In a very short time Francesco opened his eyes, looked around him, then recognized his wife and children, and burst into a flood of tears.

"We are saved, dearest Margarita! we are saved!" at length exclaimed Francesco.

But Margarita looked first at the wounded infant, and then at the stupified Antonio. Francesco comprehended her meaning, and groaned with a look of despair.

"Messire Netcelli," said the humpback, "I am shocked at your ingratitude. Place your trust in the blessed Virgin and the holy saints. Your wife has been restored to you, why should not your children be also saved? Arise and assist me to restore animation."

Netcelli arose with difficulty, and assisted the good tailor in his efforts. The children opened their eyes and smiled upon their mother.

"Now, then," said the Italian painter, "now is the time to go and demand aid at the hands of my uncle Rembrandt. I will tell him of our misfortunes and our miserable plight, and he cannot refuse us."

The tailor shrugged up his shoulders, and with a sneer replied—

"You may as well demand aid and consolation from a door-post; but, since you are bent upon going, I will accompany you to the quarter of the Jews, where the old gentleman resides. He is not only a painter, but an usurer, and Heaven have mercy upon his victims. May you be successful in your appeal, though I much doubt it."

The humpback lighted his lantern, and was about to take his cloak from the bed; but, on second thoughts, he left it as a covering for the sick mother. He then beckoned to the stranger, and led the way to Rembrandt's abode, which was situated at the other extremity of the city.

The snow had ceased, and the howling wind was scattering the clouds in wild confusion, while the struggling moon was by fits casting around an unearthly light. The streets and the houses were covered with snow; not a soul met them on their way; all was dead silence and solitude. It seemed a fit season for the carnival of evil spirits who are permitted to hold uncurbed dominion on the night of All Saints. So thought Nicholas Borruelo, as every now and then he looked anxiously around and behind him, as though he expected to see a troop of ghosts and goblins in the full enjoyment of their unholy sabbath. He hurried his companion along, and at last reached the quarter of the Jews, a district under the ban of all good Christian souls, and rendered yet more detestable by its being shut in on one side by an extensive and abandoned burying-ground. Borruelo pointed out to Netcelli a large white house, flanked on each side by a small tower. It stood within a large space of ground, surrounded by a high wall; its windows overlooked the cemetery. Altogether, the house had a gloomy, desolate, and abandoned appearance. The Italian painter approached a low, narrow door, which was, for security, thickly covered with iron plates, and rang the bell. The sound was instantly answered by the fierce barking of several dogs.

He paused, waited, listened attentively; but no footsteps were heard. He sounded the bell again and again, but to as little purpose, while the fury

of the dogs was increased to a tenfold degree. Again he sounded, when suddenly the dogs ceased their barking. The tailor and his companion heard many a bolt and bar withdrawn, and an inner door opened, and the dull echo of a heavy footstep descending some steps into the courtyard. This was followed by the sound of an old man's dry, hollow cough. They waited for the opening of the outer gate until their patience was exhausted, and then Netcelli gave another pull at the bell, which rang as if it would split. They then learned why it was that the footsteps were heard in the court-yard, for in an instant the loosened dogs bounded in savage fury against the door. They were convinced of the obstinate determination of the inmates of the house—that they would not allow admittance to any one at that late hour of night.

"I knew how it would be," murmured the little tailor; "the old miser takes us for robbers or murderers, and is determined not to open. It is better to return to the fire in my little room than to be standing before this miserable house, and by that frightful churchyard. This night is the festival of the dead, and every moment I expect to see some of them rise up in their fearful winding-sheets. Oh, Messire Netcelli! if you did but know what dreadful tales people tell of the diabolical goings on in that dismal churchyard. The spectres and imps of darkness sometimes proceed from the graves and charnel-house to old Rembrandt's mansion, and there they enjoy themselves in a rare jubilee. The mansion stood empty for twenty long years; no one was bold enough to buy it; everybody feared visits from the dead bodies in the burying-ground. But old Rembrandt was not to be frightened; he bought the house dirt cheap, for a mere old song; for, to save a hundred florins, he would take up his abode at the very gates of the infernal regions. He need not be afraid of robbers, for, besides those dogs, they say he has made a bargain with an unearthly imp, who every night keeps guard by squatting upon his money-chest. Let us along—let us along, and all the saints grant that we may reach home in a whole skin, and without meeting any spectres or witches!"

He seized the young painter by the arm, and almost dragged him along, for the noise of the crisp snow under their feet, and the low, plaintive murmur of the wind, which was again rising, made him fancy that he heard the lamentation of some restless and despairing unsubstantial being. Dispirited, and with his heart aching with deep grief, and a thousand torturing anxieties, the young man allowed himself to be led along with silent submission. By the time he reached the tailor's abode, he was, moreover, thoroughly overcome with fatigue, while he was fearful to enter, because of apprehension of new calamity. He staggered against the door faint and irresolute, and paused for a moment to gain sufficient strength to enter.

"Mother, mother," said the little Antonio, from within, "open your eyes and speak to me, for I am very cold and very hungry!"

But the poor mother answered not.

Netcelli rushed desperately into the room; it was perfectly dark. He stumbled against a chair and table which had been overturned; the window had been burst in by the violence of the wind, which must have blown in fierce gusts through the broken casement. He felt about until he

came to the bedside, and, stretching forward his hands, they encountered the cold and stiff body of his infant child, around which were twined in fond endearment the arms of its mother. Nicholas Borruelo followed slowly, in silence and secret consternation. He marched to the corner of the room where should have stood his cupboard, and where he sought his tinderbox. But the wind had overturned his cupboard, the floor was thickly strewn with fragments of broken plates and kitchen utensils, and the tinderbox could nowhere be found. He was afraid of passing the remainder of the night in the cold and in darkness, and he called on Netcelli for assistance. But no answer was returned. A cry of anguish would have been more consoling than that appalling silence; the tailor got frightened, and, rushing into the street, ran towards the guard-house. All the soldiers knew him for a kind-hearted little fellow; they invited him in, and made room for him before the fire. He warmed himself, and expressed his worst fears; and the sergeant ordered two soldiers to accompany him to his lodgings, with lanterns and a bottle of wine. In his hurry he had left the door open; on his arrival he found it closed. He hammered at the door, but in vain; not a sound was heard in reply. The soldiers were just about breaking open the door, when Borruelo bethought him that the key was in his pocket. He opened and entered, and their eyes rested on a dreadful sight. The mother and youngest child were lying dead upon the bed, on one corner of which, also, the husband was seated, deadly pale, with haggard countenance, protruding eyes, and an idiotic laugh, and the boy Antonio was struggling in violent convulsions.

"Gracious heavens!" exclaimed the tailor, "what dreadful crimes have I committed to be surrounded by such misery? Here lie two human beings quite dead, another is in the last agony of death, while the fourth is sunk in irretrievable idiocy. The holy Virgin and the saints protect me on this fearful night!"

With this he fell into a chair, covered his face with his two hands, and for some moments gave way to silent and deep grief.

Meanwhile the soldiers had lighted a blazing fire of wood, and with some boards stopped up the broken window. They also moved the dead bodies from the apartment into an adjoining room, which was the tailor's workshop. Borruelo caught up the boy, and held him before the fire, while he tended him with the utmost care. The boy revived, and, perceiving that the soldiers were about to lead away his idiot father, he broke from Borruelo's arms, and rushed up to them, entreating that he might accompany his father.

"Nay," said Nicholas Borruelo, "take him not away; since I have the keeping of the dead, I will not lose sight of the living. The boy is out of danger, and the poor idiot is harmless, and will not injure me; so even let him stay here. In the morning two of your comrades will, perhaps, look in to see that all is safe, and after that I will go to old Rembrandt's house, explain all circumstances, when, miser and obdurate as he is, he cannot refuse to bury his dead relatives, support the young boy, and, perhaps, obtain, through the city authorities, admission for his poor nephew into the public lunatic asylum."

He bade the soldiers good night, who would not depart until they had made the little man swallow a good cup of comfortable wine. When they

were gone he threw some more wood on the fire, seated the idiot by the fireside, lifted the boy upon the bed, well wrapped him up in his cloak, took down a branch of holy box-wood and a small crucifix, and laid them on the two dead bodies, and then placed himself by the fire, and, pulling out his beads, told them over and over, repeating a multitude of prayers, until morning had fairly dawned.

The first rays of light that pierced the gloom of the chamber fell upon the figure of Francesco Netti. He was seated, but nearly bent double, as he leaned forward towards the fire, with a fixed, soulless, stupid gaze at the flickering flames, while, now and then, he would give an idiotic grin, and chatter incoherently. The little Antonio was sunk in profound sleep upon the bed, where he remained until Borruelo heard the deep tones of the cathedral clock sounding the hour of eight.

"You must get up, *mio caro!*" said the kind-hearted tailor; "the morning is wearing apace, and we have much to do."

"But my father and my mother, where are they?" demanded the boy, as he sat up in his bed.

"Your father sits there," said the tailor; "but he is too ill to speak to you. Your mother is fast asleep; but her last injunctions were that you should go with me to her uncle, Messire Rembrandt; so get up like a good child."

At last he got the child up, and, leading him by the hand, he made the best of his way to the quarter of the Jews. He stood for a moment gazing in evident disgust at the house, then, as if summoning sudden resolution, he pulled the bell violently. The summons was answered by an old woman, very meanly clad—indeed, her dress was in no wise better than what was worn by the commonest servant. But Borruelo instantly knew her for the mistress of the mansion, and he took off his cap, and made her a low reverence.

"What do you want?" said she, abruptly, and in a hoarse voice.

"Our business is with Maître Rembrandt," answered Borruelo; "we would speak to him."

"Indeed!" said the other, sharply. "And pray, my master, what may be your business? You cannot see him now; my husband is busy painting. Return at noon."

"It will be impossible for me to return at noon," answered the tailor, doggedly; "and I opine that Messire Rembrandt will be sorry that he has not spoken with me. I bring him—I wish to restore to him something that belongs to him."

"Is it money?" demanded the wife, with a keen, eager, penetrating look.

"It's something valuable," replied the tailor, with perfect *sang froid*.

The wife held the door half shut, and for a moment or two hesitated. At length, she said,—

"You can come in, but, if I find you have deceived me, your interview, I promise you, will be of the shortest; for you shall not with impunity interrupt Maître Rembrandt in the midst of his precious labors."

She opened wide the door, Borruelo and young Antonio entered the court-yard, and she shut, looked, and bolted again, the gate with the utmost precaution. As they crossed the yard, the tailor observed four great, shaggy, savage mastiffs, which came forth from their respective kennels to have a look at the strangers, and he blessed him-

self that he had escaped their jaws on the previous evening. They then ascended a lofty flight of stone steps, entered the vestibule, traversed one or two apartments, spacious, though dreary, and wholly devoid of furniture, and were at length ushered into a large room, lighted by a single window of small dimensions, worked through the wall just under the ceiling. The sudden transition from light to darkness prevented the tailor and his companion for a few minutes from seeing any object distinctly. At length they perceived, in the corner opposite to the window, a man past the meridian of life, with his head wrapped round with a piece of linen which had once been white, a long-neglected beard, a brow and face deeply furrowed either by old age or care, and eyes greenish, piercing, and restless, like those of some wild animal. He was standing, silent and wrapt in thought, before a picture, which rested on an easel, and which, every now and then, he touched with his brush, and at each touch produced a marvellous effect. His brush, indeed, seemed to possess all the miraculous potency of a true magician's wand. Before him, and stationed right beneath the rays of day which streamed through the small window, was a man in a winding-sheet, in the attitude of one just awakened from the iron sleep of death, and coming forth into light and life from the darkness and horrors of the sepulchre. The old man continued to work away without casting a look at the strangers, while the old lady quietly seated herself at the chimney-corner, first stirring up the savory contents of a large copper pot which was hanging over the fire, and then cleaning and preparing a quantity of vegetables with the assiduity of a regular cook.

Nevertheless, Borruelo could not help approaching the glorious performance upon which Rembrandt was at work. The little Antonio followed his example. They were lost in astonishment at the extraordinary creation of the painter's genius. They could not be otherwise; the most insensate heart must have bounded with enthusiasm at the wonderful production, which was no other than the "RESURRECTION OF LAZARUS."

"Holiest Queen of Heaven," at length exclaimed the young Antonio, "how very beautiful!"

At the sound of the youthful and silvery voice immediately behind him, Rembrandt turned suddenly round, and said, in a sharp, half-angry tone,—

"Why dost thou speak of things about which thou canst know nothing?"

"My father is a painter," answered the boy, readily; "and then I have an uncle who is very celebrated as an artist. My father has often told me that he was the pride and ornament of the Flemish school!"

"Ah!" exclaimed Rembrandt, "thou art, then, the nephew of Rubens; for after myself, I know no one deserving of such high eulogium. Tell thy father, boy, that thy uncle Rubens is a very great painter, but not the best that Flanders has produced!"

"My uncle," said the boy, with quickness, "is a finer painter than Rubens, and than even yourself!"

"And who, then, may be this rare phoenix?" demanded Rembrandt, with a disdainful smile.

"His name," answered Antonio, "is Rembrandt!"

"Ha!" exclaimed the painter, "thou the

nephew of Rembrandt!—Thou! Thou art, then, the son of that poverty-stricken Netcelli, whom my infatuated niece espoused contrary to my strict commands! Hence!—away! I will have nothing to do with either thee or thy father, whom I despise!”

The poor boy gave way to a violent and bitter food of tears.

“Must he, then, needs perish from cold and hunger,” asked Borruelo, “like his mother and his little sister, who both died last night?”

“Let him then look to his father!” said the painter, savagely.

“His father!” exclaimed Nicholas; “long-suffering, privations, and misery, have bereft him of reason. He is a madman!”

“My father—my mother—my sister!” cried out Antonio, still weeping bitterly.

Even the hard heart of Rembrandt could not withstand this; a solitary tear was visible on his wrinkled cheek.

“And is what you tell me really true?” demanded he. “What, Jeanne, the only child of my poor sister!”

“And she has only met her deserts!” exclaimed a sharp, piercing voice; and dame Rembrandt, with her arms akimbo, came forward from her seat, where she had been busying herself with her cookery. “If the foolish young hussy had not disobeyed you—if she had listened to your advice, her miserable end had been avoided.”

“Messire Rembrandt,” said the tailor, calmly turning away from the old woman, “your nephew has lost his reason entirely; your niece and her infant daughter are lying dead; have some pity! Bury the mother and infant; give food to the helpless father, and this no less helpless boy!”

Rembrandt looked hesitatingly towards his wife, but she seized the boy by the arm, and brought him with such force to where the tailor stood, that the little man was pushed back several steps towards the door.

“And is it so?” she screamed out. “Is my husband to take charge of a madman, and a boy so ill brought up that he may prove a curse? Is he to work night and day for miserable creatures not worthy of his bounty? Never, while I live! Hence!—Get out of the house!”

“And is that your determination, Messire Rembrandt!” firmly demanded the indignant Borruelo.

Rembrandt proceeded with his painting, as if he did not hear the question.

“Come, then, Antonio,” exclaimed the tailor, taking him up in his arms, “since God has cast thee in my path, thou shalt never want a friend while I can work! Hence!—away from this accursed house, which is full of gold, but where even a morsel of bread has been denied to thee and thy famishing father! Out upon this family, without a heart and without pity!”

The tailor with his charge left the rich Rembrandt's house, his heart bursting with anger and deep indignation.

As they were proceeding along the streets towards Borruelo's abode, a party of horsemen in rich attire passed so rapidly, that Borruelo escaped with difficulty, while little Antonio's foot slipped, and he fell under the horse of the principal cavalier. He instantly dismounted, raised the boy, kindly inquired if he had received any injury; and, finding that he was unhurt, the horseman slipped a piece of silver into Antonio's hand, again

mounted, and asked Borruelo the way to the abode of Rembrandt the painter.

“It is at the end of the second street on the right-hand side, in the Jews' quarter,” answered the tailor. “You, noble lord, are rich, and are sure of meeting with a gracious reception.”

“And do not the poor, also, sometimes receive a kind welcome?” demanded the cavalier.

“The poor a kind welcome!” exclaimed the tailor. “In that accursed house there is not even a morsel of bread for the master's own nephew!”

The horseman seemed interested, and Borruelo, in the fullness of his heart, gave the history of the Netcelli family.

His auditor took his purse from his girdle, and counted four pieces of gold into Borruelo's hand.

“Here is a trifle,” said he, “for burying the dead, and for the present comfort of the living; and now thy name, friend, and the place of thy abode? Thou art an honor to humanity! I will see thee again this evening, and advise with thee what had best be done with this poor unfortunate boy.”

The tailor gave his name and address, not far from the western city gate. The cavalier bade him farewell, and, setting spurs to his horse, galloped after his companions.

On the departure of the tailor and the boy, Rembrandt sought his palette and brushes, with which a huge monkey (supposed to be the painter's familiar spirit) was playing; but his heart was ill at ease and his hand trembled, so that he could not please himself by a single touch. He flung both aside in disgust. His thoughts wandered back to the days of his own impoverished youth when his cares were soothed by the fond affection of his eldest sister, Louise; and he was now abandoning the offspring of another sister, Margaret, to want and dreadful privations. With reluctant hand he drew forth a leathern purse from the pocket of his doublet, and began counting out some money. At this sound his wife arose from her occupation before the fire, and stood over him while he told the pieces.

“Here,” said he at length, “take these six crowns to the lodging of Borruelo the tailor, and tell him that I will shortly send more.”

Dame Rembrandt did all to prevent his purpose, used every argument against it, and at last abused him for his ill-placed liberality. This led to an altercation, which the painter ended by peremptorily commanding her silence.

“Listen to me, woman!” said he, sternly; “when I selected for my wife a peasant girl—a mere servant—I did so that I might be always obeyed. Do my bidding without another word. I desire that my niece and her child should be decently interred, and that the father and the boy should have wherewithal to purchase food. Hence, and begone!”

Dame Rembrandt knew her husband's humor, and she obeyed in silence. She was preparing to depart, and Rembrandt had once more resumed his labor with greater satisfaction, when a violent pull of the bell announced the approach of strangers. Rembrandt started, and made so false a stroke with his brush, that he uttered a loud oath, which brought his wife running to see what was the matter. The strangers before the gate would not evidently brook delay, for the bell was again rung yet more violently.

The wife ran out to open, though in a great passion, and with a volley of abuse ready upon her

lips; but she was startled into silence when she beheld a dismounted page in costly livery standing at the door, and a number of richly-attired cavaliers on horseback, and in the midst of them a lady, still young and beautiful.

The principal horseman of the group then addressed her:—

“Pray, good woman, inform your master that a stranger, just arrived from Antwerp for the purpose of purchasing some paintings, is desirous of being admitted into his studio.”

They all dismounted and followed her into the house, the page being left behind to take care of the horses. Rembrandt, but little in humor for company, received the party in a surly manner. Nothing could exceed the ease and graceful deportment of the stranger. Heeding little the repulsive bearing of Rembrandt, he took a stool and seated himself before the picture over which Rembrandt had been at work. No one could have looked upon these men without being struck by the difference of their appearance. They differed as light differs from darkness, yet each bore upon him the manifest stamp of genius. The stranger was tall of stature and of symmetrical proportions; and, though of fifty years of age, there was elasticity in his gait, and his manner evinced lightness of heart and much still of the buoyancy of youth. His handsome figure was well set off by magnificence of dress; had he been a prince, he could not have carried more costly attire. His ample brow was shaded by a large hat, surmounted by a broad black feather. His eye was clear and full, and its look penetrating; his mouth well formed and small, with an habitual smile playing around it, and his white and small hand might well have raised the envy of many a beautiful woman. His every action showed that he was noble by birth, and that his daily intercourse through life had been with the highest nobles of the land. The face and appearance of Rembrandt, on the contrary, indicated an anticipated old age—the result either of incessant toil, of aching anxieties and hard struggles with poverty, or of the uncontrollable turbulence of the passions. He was short, stout, bent in the body, heavy of foot, dirty in face and attire, and with a coat for which no Jew clothesman of the district would have given a groat. His long hair, already gray, was gathered up under a piece of dirty linen, and his face was marked by a hundred wrinkles, but the searching glance of his eye manifested the depth of soul that lurked within that miserable-looking body.

While Rembrandt was playing with his hideous favorite, the monkey, the stranger was minutely examining the painting on the easel.

“What magic of color!” he at length exclaimed, in the utmost surprise and admiration: “what freshness! what transparency! The school of Venice has never produced anything to compete with this admirable performance! Master Rembrandt, I must possess this treasure!”

“Impossible!” answered Rembrandt; “this has been executed by the express commands of the princess Clara Eugenia, and the price is a thousand florins!”

“I will,” said the other, “go nearer its value, and give you four thousand florins. My gallery will be dishonored without such an ornament. That is not destined for the palace of the governor of the low countries. Come, Master Rembrandt, the painting is mine. Here, Vandyke, pay Meseire Rembrandt four thousand florins!”

“Vandyke!” exclaimed Rembrandt; “and who may you be, to command the services of Vandyke as squire and treasurer?”

“I,” answered the stranger, “am Peter Paul Rubens, and I am come from Antwerp expressly to visit you!”

“Rubens!” exclaimed Rembrandt, eying his mighty rival from head to foot. “Since you are a brother artist, you will excuse me if I continue my labors; for time is precious, and bread very hard to earn!” He heaved a deep hypocritical sigh, and then added, with somewhat of a malicious smile, “I, alas, can never expect to have as much as four thousand florins to throw away upon a painting!”

At the moment of uttering these words he secretly hugged himself with the conviction that his private cellar contained the thirty barrels of gold pieces which were actually found there after his death.

Rembrandt resumed his work, and in less than an hour the immortal painting was finished. The hour was passed in uninterrupted silence, and during the whole time Rubens, standing behind him, closely watched the manner in which he laid on colors and managed the astonishing effect of his light and shade.

When the painting was fairly finished he turned to Rubens and begged his acceptance of it, as a token of his admiration of his rival’s genius. For the first and last time in his long life the miser refused money.

“It is not yet mid-day,” said he, “and before night I can sketch out and finish another subject. Accept this as a token of my regard. If sometimes I have passed sleepless nights, it was because my thoughts were employed on the preëminent success of my great rival!”

“I am not your rival, Master Rembrandt, but your humble pupil,” answered Rubens, whose bosom was ever free from envy, as his generosity was unbounded; “and that I may prove to you that I am your pupil, and you my master, allow me to have that piece of canvass and the brushes which you have just laid down. I will imitate your manner, and show you how aptly I have learned my lesson. Come hither, my sweet Helen, and sit down right under the light from that window. Place also on thy head this broad straw hat, and be a patient and docile model. My worthy brother artist, allow me to present to you my excellent wife!”

Rembrandt regarded for some moments the charming creature before him with a sardonic smile; then calling to the old woman who was still busy before the fire, he took her by the hand, and, imitating the manner of the noble Rubens, he said,—

“And this, messire, is my wife; allow me to present her to your distinguished notice!”

But Rubens was seated at his task without, however, interrupting the conversation.

“Some weeks ago,” said he, “I had many anxious moments on your account, my worthy sir. There was a report at Antwerp of your death; and a picture-broker even showed a letter from your son, confirming the sad intelligence!”

Rembrandt gave a suppressed laugh, and unblushingly answered—

“The truth is, I was sadly in want of six thousand florins, which still remain due as part of the purchase-money of this house. I myself spread the report of my death, and the trick succeeded,

for my paintings immediately doubled their prices.* But, pray," he continued, "a thousand excuses; it's my dinner-hour, and forgive me if I eat, without, however, interrupting you. I dare not ask you to partake of my sorry repast. It would be unwelcome to the high fed stomachs of yourself and your gentlemen. But what would you have? It is not the lot of all painters to become like you an ambassador and a prince. It was never my good fortune to receive favors at the hands of the kings of Spain and of the Indies, and of England; nor am I a member of any order of knighthood in Christendom; and all my followers consist of my monkey, my wife, and my son Titus, when he happens to be at Cologne. 'Come, come, Katherine, serve up the soup and the dinner!'"

All this was said with a bitter sneer, unperceived by Rubens, but understood by the wife, who well knew every turn of her husband's humor. She spread a soiled cloth upon his table, brought two earthen-ware plates, and poured forth the contents of the pot into a deep earthenware dish. It consisted of a thick soup, mixed up with vegetables and bread. A piece of lean, over-boiled beef, some salt herrings, some cheese, and a jug of beer, completed the measure of the repast. The husband and wife sat down regardless of the company, and ate like a couple of famished wolves. When they had finished, Rubens was giving the last finishing touches to the head upon his caavass. It was the famous "Chapeau de Paille," painted under the inspiration of the lesson received from Rembrandt, and exhibiting all the mysterious influences of light and shade, so characteristic of the manner of the great master of Cologne.

Rembrandt regarded the performance with forced admiration, while secret jealousy was burning at his heart. Rubens presented the painting to Rembrandt.

"We are now," said Rembrandt, "more than quit, for I remain your debtor."

"No, Messire Rembrandt," answered Rubens, "we are not quit. Without the lesson received from you, I should never have been able to paint this portrait, which may well be called my master-piece. Permit me now to present to you this case of silver for your dinner-table. I have had the contents expressly made for you, and your cipher is engraved on each piece. Whenever you use them, I beg you to cast a thought upon your admirer, your pupil, and, also, if you will permit me the honor of that appellation, upon your friend!"

Rembrandt regarded the present with perfect indifference, while old Katherine seized the casket, and, turning out the silver-handled knives, forks, and spoons, for a long time kept admiring their beauty.

* Rembrandt had recourse to the meanest expedients to raise the prices of his paintings, and to get money for the wretched purpose of hoarding up. He was, moreover, a miser and notorious extortioner. He would also, for larger profit, sell his engravings by auction, and even get persons to bid up their prices to an unconscionable amount; and the imperfect ones were sold by candle-light, that their defects might pass unperceived. Mention has been made of a *picture-broker*. This was, during the glorious times of art in the Low Countries, a regular and very lucrative calling. The individuals following it, like the *bulls* and *bears* of our modern Stock Exchange, endeavored to raise and lower the prices of paintings by a thousand rumors and contrivances. They also had their time bargains for the works of eminent masters, and every other mode of profit so well known to stock-jobbers.

"Ha, ha, ha, Katherine, they are much finer than the pewter ones we have been accustomed to use!" exclaimed old Rembrandt. "However, put them aside, wife—put them away!" he continued; "and you, Messire Rubens, are a great lord, and it would not become a poor artist like me to refuse the tokens of your beneficence. I would humbly ask permission, noble sir, to pay my respects to you either this evening or to-morrow morning. For the present I cease to be a painter. When the hour of two strikes I become merchant, and every moment I expect Levi Zacharias, the silk-merchant, Solomon Larch, the banker, and Samuel Netscham, the picture-broker. At what hotel do you lodge, Messire Rubens!"

"I am at the Count Peñafor's, the governor of the city," answered Rubens. "Adieu, Master Rembrandt, let me see you this evening."

"It shall be this evening," answered Rembrandt, bowing servilely to the very ground.

Rubens led forth his Helen, the gentlemen of his train followed, the party remounted their horses and departed.

"He is a prince!" murmured Rembrandt, as they departed—"he is a very king! He enjoys life in the midst of pleasure and magnificence. Perhaps he is right, perhaps I am an insensate fool, for living thus meanly and obscurely. But what matters," he cried, with an hysterical laugh and an exulting glance of his eye—"ay, what matters, while I have in my secret cellar, and under the safeguard of this key that never quits my side, that which would serve to satisfy the wildest caprices of an emperor! Then lavish, Rubens, all the produce of thy labors in idle acts of generosity and useless extravagance; I also have power, if I would wield it, in the increasing amount of my hoarded treasures!"

The remainder of the day was devoted by Rembrandt to the reception of various persons who knew his habits, and never disturbed him on matters of business till the afternoon. The painter would see anybody and upon any matter, provided only he could realize the exorbitant interest which he invariably demanded. In the evening he bethought him of the promised visit to Rubens, and he left the house for that purpose.

As he approached the heart of the city, he was surprised at the crowds of people in the streets. There seemed a general commotion: something very extraordinary must have happened. There came the body of the city crossbow-men in full uniform; the archers shortly followed, with their band playing a joyous strain of music; and then passed in quick time the arquebusiers, with lighted matches, as if they were about to fire off their pieces. Presently he met the burgomaster of the city.

"Well met, Messire Anthon von Opsam!" said Rembrandt; "what is all this noise and confusion about?"

"I cannot stop!" answered the little fat burgomaster, as he bustled onward; "come along, come along!" and he seized the painter by the arm, and they proceeded together.

"Most important news has just arrived," continued Anthon von Opsam. "The United Provinces have yielded to the rule of Spain; the States-general have notified their submission. 'This is the work of Messire Rubens, who negotiated the treaty. All the companies of the city, with the burgomaster and sheriffs at their head, are about to go in procession to the governor's house, to congratulate Messire Rubens on the auspicious

event. Listen only to the shouts of the people."

And on every side was shouted, "Long live the king of Spain!" "Long live Rubens!" "Long live the friend and benefactor of the United Provinces!" These cries were followed by repeated *feux-de-joie* from the arquebusiers.

"What!" said the burgomaster, as Rembrandt stopped suddenly—"What! will you not accompany us to compliment Messire Rubens?"

"No," answered Rembrandt, in a low tone of voice; "it is getting late, and my wife will be uneasy at my absence. Adieu!"

On saying this he plunged into the midst of the crowd.

"Long live Rubens! Long live the friend and benefactor of the United Provinces!" said he, as he now and then ground his teeth for vexation and spite. "This man, then, has every kind of talent, and reaps glory from everything that he attempts. But what of that? He may be a better diplomatist than I am; but I am curious to know if posterity will admire his paintings more than mine. After all, old Rembrandt will have his glory. And then for money! Ha! ha! ha! He dissipates his fortune with an open hand; while I—I could pay off, with my hoarded wealth, the debts of an impoverished kingdom!"

At that moment the air resounded with a thousand acclamations. He turned his head, and saw Rubens from the balcony of the governor's palace, acknowledging the loud salutations of the citizens of Cologne. He never stopped nor turned his head again, but hurried back to his house.

"What ails thee!" demanded his wife; "thou art breathless; thy lips are livid; thy eyes wander; thou hast torn the collar of thy doublet; thy hand still holds the fragment! What ails thee?"

"Peace! peace, woman! I would be alone!" answered Rembrandt, in a savage tone, that would not bear contradiction. When he was alone, he flung himself into his old leathern arm-chair, and exclaimed, as with his clenched hand he violently struck his forehead, "Madman that I am to be envious of this man!"

But we must return to our honest friend Nicholas Borruelo and the young Antonio. After receiving the four pieces of gold from the generous cavalier, he bought food and a bottle of beer, which he placed upon his small table, and gave orders for the decent interment of the mother and her child. On looking round, he saw the idiot father crouched in the corner of the room, greedily devouring the food, which he had, unperceived, taken from the table, and utterly regardless of the hungry boy or his generous protector. The tailor was shocked beyond measure; for he wanted no further proof of the utter abasement of the father's mind.

"Yesterday," said he, sorrowfully, "this man showed an heroic courage—the tenderest devotion for his wife and children; to-day his reason is departed, and by the cold remains of those most dear to him he follows the call of a grovelling instinct! Yesterday he was almost an angel; to-day he is less than the vilest animal!"

The burial duly took place, and the coffins were followed by the tailor's neighbors; for everybody was ready to pay the tribute of respect to one who had acted with such singular kind-heartedness. The day was now wearing away rapidly, and yet the stranger had not made his appearance according to his promise. Nicholas Borruelo made many

reflections on the heartlessness of the rich. The selfish uncle had turned his little nephew into the street, to starve, or beg his bread, and had refused assistance for the burial of his niece. The rich stranger had lightly forgotten a promise lightly made, and never requested.

"Ah! Master Eustache," said he to his neighbor, the cabinet-maker, "let us thank God that he has made us poor; for, believe me, friend, it is only the poor who best know and most keenly feel for the sufferings of the poor!"

"By our lady, neighbor!" answered the cabinet-maker, "you are a worthy man, and I honor you from my very heart. But, look you, friend Nicholas, I am somewhat jealous that you should have all this good work to yourself; so now, if you have no objection, while you board and lodge the poor boy Antonio, I will teach him my trade; and I promise to turn him out the best workman in Cologne. What say you?"

They shook each other cordially by the hand, and the bargain was soon concluded.

By way of parenthesis, it is necessary to mention two circumstances. Dame Katherine Rembrandt, profiting by the arrival of Rubens, and her husband's consequent temper, had quietly put into her own pocket the six crowns destined for the necessities of the Netcellis; and a messenger came post-haste to Cologne, at the very moment when Rubens was appearing before the people on the balcony of the palace, commanding his instant departure for Brussels, there to be intrusted with the management of another most important mission. He departed that same evening, and thus was prevented the promised visit to honest Nicholas Borruelo.

Now, like Time, who enters as chorus in the fourth act of the *Winter's Tale*, we must beg permission to slide over the space of a few years.

Ten years, then, after the circumstances narrated, Rubens once more visited the old city of Cologne; being commissioned by his sovereign, Philip II. of Spain, to form a collection of the works of the most celebrated masters of the Flemish school for the Escorial Gallery. The commands of his sovereign he was bound to obey personally; and the first master to whom he applied, as a matter of course, was Rembrandt. When Rubens approached the house, he was surprised to find many embellishments on the exterior, and when he entered he was struck with the numerous improvements. He was ushered in by a servant neatly dressed, and met in the antechamber by an old lady well attired; short, plump, bustling, and with an eye beaming with good nature.

"Messire Rubens," said she, as soon as she knew the name and quality of her visitor, and in tones of earnest cordiality, "my brother will be rejoiced to see such a guest; for you will be our guest. Is it not so! Messire Rubens will never think of receiving hospitality from any other than his admirer, Rembrandt?"

Rubens excused himself; but the good lady would hardly listen to him. At all events, she insisted on his dining with her brother; and, opening the door of the studio, she announced the name of their distinguished visitor. This apartment had undergone less change than the other parts of the house. The old fire-place, however, had now given way to a stove ornamented with porcelain.

"Welcome," exclaimed Rembrandt, "to the

King of Antwerp; but what has your royalty done with your customary suite?"

Rubens colored deeply at this salutation, which was ironically uttered; but as Rembrandt's eye met that of his sister, his manners changed, and he assumed a much more cordial tone. He shook Rubens warmly by the hand, as he said, "It is many a long year, Messire Rubens, since we met, and many events have since then passed. My old Katherine, whom perhaps you remember, is dead. Heaven be praised!"

"Brother! brother! for shame!" interposed the sister.

"My sister Louise," said Rembrandt, "has kindly come to take care of me and my house. She is devoted in her attachment to me. She is a perfect angel, Messire Rubens—she is a perfect angel." His voice faltered while approaching his sister, whose hand he affectionately kissed.

A tear glistened in the eye of the generous-hearted Rubens, as he looked at Louise with profound respect. Louise blushed like a young girl of sixteen.

"I trust, Messire Rubens," said Rembrandt, "that you will receive better treatment at our hands than when last you saw us. I am ashamed of the sorry reception we then gave you. But who comes here?" continued he, as he turned to the door, which was opened by Master Nikeleker, the notary.

The sister was desirous of preventing his entry, on the plea that her brother had company, and could not be disturbed.

"Ha! ha!" exclaimed the notary, in a hearty tone; "you must not keep me out, Mademoiselle Louise. I bring tidings of your having become a great heiress, and Master Rembrandt has an accession to his fortune of two hundred thousand florins."

"Two hundred thousand florins!" shouted Rembrandt, in an ecstasy of delight.

"Yes, sir," answered the notary. "Your uncle, Eustache Gerritz, is no more. He has left in all six hundred thousand florins—one-third for you, one-third for Mademoiselle, and the remaining third for the children of your sister Margaret."

"My sister Margaret," said Rembrandt, vehemently, "died many years ago."

"Aye, aye," replied the notary; "but her children!"

"Dead, also," asserted the painter.

"Their deaths, then," said Nikeleker, "must be legally proved; for, until that is done, the division of the property cannot possibly take place."

"That can be done in less than an hour's time," answered Rembrandt. "The girl, I know, died: the boy was sickly, and, I dare say, is long since dead; unless, indeed, Nicholas Borruelo, the tailor, who took charge of him, sent him to the hospital."

"The boy of our sister Margaret?" cried the tender Louise; "did she leave a surviving child? Oh, brother, brother! Heaven have mercy upon you! Why did you never mention to me the fact of the boy's existence?"

"Why, sister," replied Rembrandt, in great confusion, "what would you have? How could I bear the expenses of rearing Margaret's boy, when I had one myself, and was, besides, a poor struggling artist, who with difficulty could gain a subsistence!"

"And," demanded sister Louise, "is it only lately that you have heard of the boy's existence?"

"It is now," said Rubens, remembering well meeting the boy and Borruelo, "ten years since Master Rembrandt knew of his nephew's existence: it was on the night of All Saints."

"Master Nikeleker!" exclaimed sister Louise, "you, doubtless, know where this Master Borruelo resides. Will you conduct me to his abode?"

"Mademoiselle," answered the notary, "he resides at the other end of the city, not far from the guard-house of the western gate. I will conduct you there with pleasure."

"And, with your permission," said Rubens, "I will join you company. I am very culpable in having forgotten a promise, and I wish to do all in my power to repair the effects of my forgetfulness!"

Louise, Rubens, and the notary, traversed the city, and entered the humble abode of Nicholas Borruelo. They saw a good-looking, healthy boy, of sixteen, hard at work on some canvass, which was on an easel in a corner of the room. He informed the visitors, in answer to their question, that Nicholas Borruelo would very shortly enter. He had, in fact, gone out with some clothes for a customer; and he handed a seat for Mademoiselle Louise, who was evidently laboring under very great excitement. Rubens went straightway up to the sketch on the easel, and uttered an exclamation of surprise and astonishment, which made the boy blush scarlet.

"Who is thy master?" demanded Rubens, turning to him.

"I never had a master, sir," answered the boy. "I amuse myself in my moments of leisure in daubing canvass, as you see; still that is but seldom, for Master Eustache, the cabinet-maker, for whom I work, has too much need of my services."

"You must put by the saw and the plane, and you must devote yourself to painting," observed Rubens.

"That, sir, is impossible," replied the boy, "for I must work hard at my trade to support myself and my father, who is now getting old."

"Thy father?" asked Dame Louise. "Does thy father yet live?"

"I speak, madam," said the boy, "of the excellent tailor, Master Nicholas Borruelo, who adopted me, and has been to me all that the kindest parent could have been. My own poor father has been dead four years. Master Borruelo supported him, also, for six long years; but he is gone to join my sainted mother and my little sister in heaven! Ah, madam, ours has been a sorrowful story; but Heaven has been merciful to me in sending me such friends as Borruelo and Eustache!"

"Thy name is Antonio Netcelli, is it not?" demanded the lady.

"Yes, most honored lady," answered the youth; "such truly is my name."

"Then thy sorrows and trials have ceased," exclaimed the lady. "Thou need'st no longer toil for thy daily subsistence; thou hast found thy family, and art become rich. My child—my child! I am thy mother's aunt, Louise." And, with many tears, the kind-hearted lady warmly embraced the young Antonio.

At that moment a heavy step was heard approaching the door, and Borruelo made his appearance. The youth left the arms of Dame Louise, and joyfully met his foster-father.

"Here is aunt Louise, father—aunt Louise, of whom my mother spoke so often, and so affectionately," said Antonio.

Dame Louise informed the tailor of the sudden change in Antonio's fortunes.

Borruelo heard the communication with evident sorrow of heart. His lips moved, and his eye was turned towards heaven in silent prayer. He then took the boy in his arms, and said, in a low, plaintive voice, "Thou art now become rich, Antonio; thou need'st no longer work at thy trade; thou must quit my roof, and wilt perhaps soon cease to love thy father."

"Never—never!" said Antonio, struggling with deep emotion. "As thou hast been, so thou shalt always be—my father. The same roof shall always cover us; we will never separate."

"Worthy man," said the good Louise, "you deserve the world's esteem; it is an honor to know you. Henceforth, look upon me as your intimate friend. And now, nephew, come with me; your uncle Rembrandt is anxious to see you."

"My uncle Rembrandt!" said the youth, drawing back, and shuddering.

"Hush!" said Dame Louise. "You must forgive the past, as those have who are now in heaven!"

"Come, then, my father," said Antonio, turning to Borruelo; "if I go, you must come with me." And he took the old man gently by the arm, and led him along.

"Young man," said Rubens, laying his hand on Antonio's shoulder, "wilt thou become my pupil? I will take thee and thy excellent father to Antwerp, and my house shall be thy home. Dost thou consent? I am Peter Paul Rubens!"

"Rubens!" cried Antonio, enthusiastically—"Rubens! What! I become the pupil of Rubens!" He paused for a few moments in great hesitation; then, running up tenderly to Dame Louise, he said, "Pardon me, noble sir, I cannot do it; I must remain with this good lady; for she is the living resemblance of my dead mother!"

Antonio Netcelli became the pupil of Rembrandt, and rapidly obtained eminence as one of the first masters of Flemish Art. To please his old uncle, he gave a Flemish termination to his Italian name, and always signed his painting GASPARD ANTOINE NETSCHER.

From the Spectator of 22 Feb.

CHINA.

FURTHER acquaintance with the "central flowery" land serves to confirm the opinion we have always expressed, that our Chinese victories were only the beginning of more complicated embarrassments.

The government of China is one of those which exist in virtue of doing nothing, and because men are accustomed to it. It is a government upon paper: its officers do not attempt to check or punish crimes—they only write essays against them. Towards the end of 1843, the child of a widow in the district of Canton was stolen by a band of robbers and held to ransom: the poor woman

could not raise the sum demanded, and the robbers roasted the child alive. The governor of the province hereupon issued a proclamation, intimating (what was too well known already) that there were numerous bands of robbers in the district, and exhorting the people "to contrive plans for capturing them and bringing them to justice." The proclamation also stated, that by this means "the number of these banditti will be daily lessened and that of well-behaved people increase; the manners and habits of the populace will undergo a renovating change." But not a word was said of any active steps about to be taken for the arrest of the kidnappers. The same fashion of publishing a lay sermon or moral essay, instead of sending policemen to arrest offenders, prevails at Peking. Robberies and murders are perpetrated as openly in the province of Pe-che-li, in which the capital is, and in the neighboring provinces of Leaoutung and Shantung, as in that of Canton; and encountered in like manner by proclamations only.

The despatches of a shrewd man like Keying to the emperor indicate the character of the prince to whom they are addressed. Little stress should be laid upon the hyperbolic compliments paid to the monarch and the abusive epithets applied to foreigners. Our best translators are mere elementary scholars in the Chinese language; its turns and combinations, so different from those of European tongues, become more strange in their schoolboy versions; and epithets are supposed to be used by the Chinese with an entire consciousness of their force, which are probably as unmeaning as the "most obedient servant" of our epistles, or have lost their original offensive meaning as completely as "furosh," (slave,) which at Medina has come to be the title of the rulers of the city. But even after translating Keying's strange phraseology into the most commonplace language, his despatches are evidently the efforts of a man of sense to reconcile an ignorant and childish despot to treaties concluded with more powerful nations upon equal terms. The wily statesman prepares the royal mind for the intelligence of what has been conceded, by sneering at the bad grammar of the foreign ministers, and enlarging on the claims that have been rejected.

There is a great amount of political insubordination as well as general lawlessness in China. In Leaoutung, (the Mandshu province nearest Peking on the east,) Chinese immigrants are occupying large districts in defiance of the prohibitions of government. In Koko-nor, (the Mongol province immediately adjoining the western termination of the north frontier of the "central flowery,") the predatory tribes threaten to invade the province of Sechuen; and the Chinese government has no better means of repelling them than by bribing one half of them to fight against the other. In Doongaria and Turkistan, (the provinces lying between Siberia and Tibet,) no taxes are paid. In Formosa, the islanders have rebelled, and were still in arms against the Mandarins at the date of the last news. In the mountains north-west of the province of Canton, there is a numerous and hardy race which has never acknowledged the imperial sovereignty.

In a country where rebellion and robbery have become chronic diseases—where the forms of government exist everywhere and its power is felt nowhere—habit may give permanence to such an imaginary constitution, so long as no impulse is

received from without. But the slightest contact with foreign influences must shake it to the foundation. That contact has taken place. England has contracted one commercial treaty with China; the United States another, in which some more favorable articles have been introduced; the French have a mission in China, which is claiming, with a good deal of bluster, more respectful treatment than was experienced by the American Envoy. The French, American, and English traders in the waters of China, are animated by their full share of national jealousy. The British settlement at Hong-kong is an eyesore to the others: France and the United States will aspire to have their islands or their settlements on the main also. The hatred of foreigners entertained by the rabble, and the powerlessness of the officers of the law, have already given rise to repeated attacks upon the European and American traders at Canton: an unprovoked assault has been made upon some English gentlemen at Fow-chow-foo. When it is the cue of any American or European government to pick a quarrel with the Chinese as a pretext for occupying a part of the Imperial territory, a substantial grievance is not likely to be long wanting. And who can doubt that such a territorial acquisition by any one state would stimulate all the rest to hasten to anticipate each other in appropriating part of the spoil? France has only to place Dupetit-Thouars on the Chinese station, in order to recommence in China the game of hostilities between the European factories and intrigues with the local native governors, which in India has terminated by leaving almost the whole of the peninsula on our hands.

From the National Intelligencer.

THE SANDWICH ISLANDS.

EVERY man whose philanthropy is not bounded by country or kin, who can rejoice in the advances of the human family in knowledge, virtue, and happiness, whether those advances take place in China or New Zealand, and mourn when he hears of violence and of wrong, of crime and of misery, as well when they occur in Labrador or Cracfraria as in London or New York, will be gratified to learn that "in the far-off isles" of the Pacific, the white man has carried not unmixed evil, but that civilization, in some of its most unquestioned shapes, is rapidly extending itself among the natives of those comparatively lately-discovered abodes of the human race. We have just received a file of "*the Polynesian*," a weekly journal, published at Honolulu, in Oahu, one of the Hawaiian or Sandwich Islands, and have made the following summary of its contents:—

There are three weekly papers published at Honolulu, viz. the "*Friend*," the "*Nonanona*," and the "*Polynesian*." The first of these is edited by a clergyman, the Rev. Samuel C. Damon, and devotes much of its columns to the cause of religion, temperance, &c. The "*Nonanona*" contains many valuable agricultural articles; and the "*Polynesian*" has been lately purchased by the government, and connected with the government printing establishment. It is published under the editorial care of J. J. Jarves, who is also the director of government printing. This last mentioned paper is therefore "the official organ," and contains the government appointments, ordinances, decrees, reports of the proceedings of

the courts, &c. The decrees and orders of the courts are generally printed in the English, the French, and the Hawaiian languages.

We find in the Polynesian a weekly summary of foreign news, selected from the journals of all countries, highly respectable disquisitions on philology, jurisprudence, the law of nations, reviews of new and foreign publications, scientific notices, &c. Thus, for example, the number dated August 24th contains an elaborate report on the finances, commerce, manufactures, &c., of Mexico, by R. C. Wyllie, British pro-consul at Honolulu—this is continued through several succeeding papers; a long and learned disquisition on the exact meaning of the words used in connexion with the subject of allegiance, in which the Roman Code, Vattel, Chancellor Kent, Judge Story, and the French and English authorities are quoted. To this succeeds an editorial article on the establishment of a public cemetery at Honolulu; news from China and from Oregon; reports of cases tried before C. Kanaina, acting Governor of Oahu; a petition to Kamehameha III. King of the Sandwich Islands, against the grant of a license for the sale of spirituous liquors in the Bay of Hilo; a list of imports for the week; notice of a meeting of the "*Hawaiian Total Abstinence Society*;" shipping intelligence; advertisements of new books, hotels, schools, sales, new goods, &c. The Polynesian is very neatly and accurately printed. Hungwa, the landlord of the Canton Hotel, advertises that he has secured the services of superior Chinese cooks and waiters; the lists of new books received, include all the recent publications of the English and American press.

In the paper of August 31st, we have an "order in council" of his Hawaiian majesty, prescribing a "code of etiquette" to be observed at his court. There is also an advertisement of "Albert E. Wilson, general commission merchant, Astoria, mouth of the Columbia river," offering his services for the sale of merchandise and purchase of the produce of the country. Other papers contain similar advertisements of merchants in California.

In the papers of the 21st and 28th of September very copious literary notices are given of the cruise of the "*United States Exploring Expedition*," as deduced from the synopsis published in this city in 1842, and the brief account published in Silliman's Journal in 1843. In the Polynesian of the 28th September is a very able article on naturalization, and the reciprocal duties of nations to each other. The same paper contains an anticipatory glance of the future importance of the Sandwich Islands in a commercial point of view. "Their riches," says the writer, "lie in the soil; of mineral wealth they have next to none. Markets are opening around us. A continent lies near us, rapidly filling with Anglo-Saxon sons. Sugar, coffee, indigo, tobacco, cotton, and cabinet lumber will be the staple commodities, and maize, wheat, yarns, arrow-root, hemp, raw silk, &c., articles of secondary value. These islands will become the West Indies of the northern Pacific; the trade will naturally go forward to Oregon, and if we do not hasten operations the demand will exceed our means of supplying it. The trade of the Southern Islands," continues the writer, "will naturally tend southward, towards the myriads of Englishmen who inhabit the Island Continent," (New Holland.) The existing trade between Columbia river and the Sandwich Islands is evidenced by an

advertisement in this week's paper of the arrival for sale of 107,000 feet of lumber, 300 barrels of superior flour, 300 barrels of "the highly-prized Columbia river salmon," &c., by the barque Brothers; and subsequent papers notice similar arrivals to a large amount. A considerable arrival of lumber, shingles, &c., from California is also noticed. In the *Polynesian* of October 5th, reference is made to a letter (the second on the subject) received from "a Maryland farmer of capital," in regard to emigration to the Sandwich Islands, with a view to the cultivation of wheat and the manufacturing of it into flour. The editor requests information upon these points, as the probable means of establishing a very desirable branch of business.

The paper of 5th October contains the following notice of the latest news which had been received from other parts of the world. This was from London to March 12th; Paris, March 10th; New Orleans, May 22d; Boston, April 10th; New York, April 26th; Mazatlan, May 30th; Society Islands, August 19th; China, June 14th. A supplement to this paper publishes "by authority" the official correspondence between G. P. Judd, Esq., secretary of state for foreign affairs, and George Brown, Esq., United States commissioner, relative to the case of John Wiley, an American citizen, who had been fined by a native court for a breach of the laws. Without in the least taking sides in the controversy between these gentlemen, we must be allowed to say that the Hawaiian secretary of state displays much diplomatic tact and address. Under date of October 12th, we find a long literary notice of "the Life, Character, and Labors, of the late Bartimeus L. Puaaiki, of Wailukee, by J. J. Green." The reviewer says: "A book in English from a Hawaiian press was not long since a *rara avis*; but now the list of authors who clothe their thoughts in that language is very respectable. Literature is looking up among us."

The total amount of whaling shipping of all nations which touched at the several ports of the Sandwich Islands, from January 1st to October 10th, 1844, is valued at \$12,183,940, being 249 vessels, which were manned by 7,200 seamen. The great preponderance of American property engaged in this business will strike every one. It exceeds that of *all other nations* by \$9,621,960, by 176 vessels, and by 5,407 men. The American vessels sail on temperance principles, and much of their success is to be attributed to this fact. The United States government bestows no bounty upon this fishery, and yet it flourishes to an extent which casts that of all other countries into the shade. The English appear to have almost entirely abandoned it. Next to the Americans, the Bretoners are the most successful; but their business can be considered little else than a branch of the American, being mainly established by them.

The high moral tone uniformly maintained by the editor of the *Polynesian* cannot be sufficiently commended, whilst the always lucid and often elegant style in which his ideas are expressed gives "to the truth a double force." The editorial article of the 26th October, on the duty of economy, and the folly of people living beyond their means, is worthy of all praise. It appears that, even in Honolulu, this species of false pride prevails to a considerable extent:

"How far this has been the case (says the editor) we will not undertake to say; but we do

fear that a false pride exists, and a spirit of emulation which prompts people to transcend their means. Individual wealth is unknown as yet; a few persons have been sufficiently fortunate to acquire a competency from the precarious and restricted business of the place. But poverty is likewise a stranger. Every industrious man has it in his power not only to secure a living, but to accumulate."

Royal trips and journeyings seem to be the fashion in Hawaii as well as in Europe. Their Majesties take sailing excursions in a royal schooner; and a cargo of royal household furniture had arrived at Honolulu for the new palace for the residence of the king, which was expected to be completed by the 1st of November. The royal party "sailed to Kailua on the 12th October, on a visit to Governor Adams, who was expected to be near his end."

The paper of 2d November contains a long editorial review of the "correspondence between the Hawaiian Secretary of State and the American Commissioner in the case of John Wiley, an American citizen—printed by order of the government." The editor handles the subject "without gloves," but decorously and in a good spirit. He concludes by expressing "his firm reliance upon the wisdom and equity of the cabinet at Washington," to whom the business has been referred. We have received a copy of the handsomely and correctly printed pamphlet, extending to seventy-eight pages, which contains this correspondence, and has been printed at the government press, Honolulu; but shall make no comments upon the subject, awaiting the arbitration of the tribunal to which the Hawaiian authorities have referred it.

The news of the rejection of the treaty for the annexation of Texas, by the Senate of the United States on the 8th June, was received at Honolulu on the 28th October, and noticed without comment. The sentiments of the British government, as expressed in a letter from Lord Aberdeen, dated July 1, 1844, and received by the British Consul General to the Sandwich Islands towards the end of October, appear to have given great satisfaction. His lordship says:

"I need not repeat the assurance, which we have already given to the government of the Sandwich Islands, that our only object is to secure the independence and permanent well-being of that country; at the same time that we ensure to all British subjects a fair and liberal treatment on the part of the government. All that the British government desires is, that British subjects and British interests in general should be placed upon the same footing with the subjects and interests of other countries, and also that that footing should be such as to prevent as far as possible all future misunderstanding and contention between the respective governments."

There were in the harbor of Honolulu, on the 2d of November, 26 American vessels, including the United States sloop-of-war Warren, Capt. Hull; 4 English vessels, including her Britannic Majesty's ketch, the Basilisk, Capt. Hunt; 8 Hawaiian, 2 Bremen, 2 French, 1 Danish, 1 Norwegian, and one Tahitian vessel; in all 45 vessels: being 2 ships-of-war, 33 ships and barques, 4 brigs, and 6 schooners.

The *Polynesian* of November 9th contains an account of Morse's Magnetic Telegraph, extracted from the Baltimore American. The same paper contains the recognition of the independence of the Sandwich Islands by the government of Belgium,

the latter expressing a desire to establish close commercial relations between the two countries.

Besides the new royal residence, it appears that a palace is also building for the governor of Oahu, which is said to be the most costly and imposing building which has been erected on the island. "Its faults, however," says the Polynesian, "and those of other public and private buildings, show that an architect of good taste and skill is much needed." The native chiefs are also building new residences in Honolulu, and the town appears to be rapidly improving.

It was stated, among other novelties, that "the Wesleyan Methodists of the Bingham circuit have erected a wooden meeting house upon wheels, capable of seating 130 persons, for the accommodation of several villages where no site can be obtained."

The Polynesian of the 16th November says that complaints have been made, without just cause, by the captains of whalers touching at Honolulu, of the amount of port charges which they have had to pay. The following statement is given of the port expenses charged on a vessel of 300 tons burden :

Tonnage duty, at 6 cents per ton, . . .	\$ 18
Buoys, &c.,	3
Pilotage in and out, \$ 1 per foot, say 28 feet, 28	—
	\$ 49

These charges are said to be very low in proportion to the advantages obtained. "The peculiar value and importance of these islands to the whaling interest" are said "to have become more conspicuous since the discovery of the great North-western hunting ground." In this quotation "*hunting*" is to be understood by the uninitiated as meaning the *catching of whales*, and "*ground*" to mean *sea*. "These islands," says the editor, "afford fresh provisions, medical aid, secure harbors, wholesome laws, the means of recruiting diminished crews, of repairing vessels, &c. If they had not existed, the whaling business must have been prosecuted under serious disadvantages."

The latest news which had been received from Tahiti (Otaheite) at Honolulu was of the 26th October, at which time the best understanding appeared to exist between the native authorities and the resident ones of England and France. Queen POMARE had been invited to return to Tahiti to resume her rights as the independent sovereign of the Society Islands, under the protectorate which had been established. This she had refused to do till the definite orders should arrive from Europe; but hopes were entertained that everything would be speedily and satisfactorily arranged.

We trust that, with the great majority of our readers, the interesting nature and the importance of the subject will supersede the necessity of any apology for the length of this article. The Anglo-Saxon or Anglo-American race are belting the world with their language, their laws, their literature, and their religion. This enterprising, energetic, and enlightened branch of the human family is, if not absolutely dominant in Europe, Asia, Africa, and America, secondary to no other race. In Australasia it is striking firm and vigorous root; and in Polynesia, our present article will show that its march has been and is rapidly onward. May it be the means of spreading true religion, sound knowledge, rational liberty, and

useful and ennobling literature, science, and art, through the universal family of mankind!

From the Spectator.

THE ENGLISH GENTLEMAN.

No nation has been great or prosperous that did not honor an idea. The power and happiness of every nation have been in proportion to the purity and elevation of the idea it has honored. The idea which England reveres and cherishes is that of the English gentleman.

The very outcast of society, when he would gall one of his betters in worldly station, can invent no reproach that he conceives more bitter than "you are no gentleman." When the Earl of Dalhousie, in the house of lords, proclaimed Captain O'Brien "a man of as pure integrity as any peer in this house," he recognized, and the peers of England with him, the unquestioned honor of the English gentleman—the title of moral nobility superior to legal rank, to which peers and commoners must alike aspire if they wish to be respected by their countrymen. The *real* gentleman is in the England of our day what the knight was in the days of chivalry: the ascendancy in council, in the field, and in the hall, which was conceded to the knight of old, is attributed now to the gentleman.

The English gentleman is that ideal character which all Englishmen aspire to be, or at least to be thought. The English gentleman is brave—physically and morally. The English gentleman is veracious—in England alone "the lie" is considered as the greatest and most inexpiable insult. The English gentleman is decorous—no deliberate profligate can hope to be thought an English gentleman. The English gentleman is humane. The English gentleman has a taste for literature and science. The English gentleman abhors ostentation; though his plainness is free from rusticity. The substratum of the character is the homely hearty squire; the *animating* principle, a spirit of chivalry such as existed in Sydney, dashed with a spice of the Puritan; and the *regulating* principle, strong common sense, with a dread of appearing ridiculous, carried almost to excess.

The English public is not exacting; it does not demand perfection from its leaders—it is ever ready to make allowance for lapses incident to humanity: but it reverences those only who keep the ideal character of the gentleman constantly before their eyes as the model upon which they seek to form themselves. The very mob have never been long faithful to any leader who was not by education and habits a gentleman. The demagogue who would count upon their fidelity must possess that refinement on the want of which they pride themselves: he may be weak, vain, headstrong, inconsistent; but a shabby trick, or anything that looks like chicanery, is fatal to his empire. The English mob retained to the last a sneaking kindness for the "faded gentleman," which the power and (in his main object) consistency of O'Connell have failed to obtain for him. And to the minister of this country the highest talents and most fervid patriotism are recommendations far weaker than the character of a true English gentleman. In practical sagacity, in broad statesmanlike views, Fox was immeasurably superior to Pitt: but the dicing and drabbing of the whig leader placed him at a disadvantage. In the present century, we have seen a statesman endowed with preternatural quickness of apprehen-

sion, unsurpassed powers of oratory, boundless ambition, energy, and indefatigable activity, lose all political influence, simply from an excess of versatility incompatible with the self-respect which is a main ingredient of the idea of an English gentleman. Lord Liverpool's and Lord Grey's best recommendation to the office of premier was their gentlemanly character: Lord Melbourne was acknowledged as the leader of his party because he was, take him all in all, much of a gentleman. The present premier, though undoubtedly possessed of all other essentials of the gentleman, has, it must be confessed, one capital fault of manner: not satisfied with acting sensibly and honorably, he is in the habit of telling parliament, with no slight parade, that he does so; a practice inconsistent with the quiet self-reliance which characterizes the English gentleman. This defect in externals has been found sufficient of itself to preclude his becoming with John Bull the object of a devoted and unhesitating confidence: and at this moment, to make matters worse, his best man of business in one house has met a rather awkward charge in a rather equivocal way; while his crack debater, now in the other house, is constantly exposing himself to the sarcasm that he studied morals at Newmarket and logic in the office of a pettifogging attorney.

The public opinion of England is formed and guided by the gentlemen of England—by the men who, whatever their fortune, rank, or profession, have cultivated minds, a manly courage, and an ever-watchful sense of honor and decorum. Their influence may be traced in our foreign as in our domestic policy—in the Quixotic scrupulousness with which England rejected all share in the spoils of Europe at the congress of Verona; in the anxiety that all nations should share the opened commerce of China.

Honor, then, to the English gentleman. If you ask where is the source of England's greatness, Mr. Cobden will say, its manufacturers—its men to whom the bank of England would gladly lend two millions; Mr. Gladstone, its church; the Duke of Buckingham, its landed proprietors; and Cobbett (if alive) would have said, its bold peasantry. And all of them are entitled to their share of credit: but the true English gentleman, wherever he is found or whatever his pursuit—whether pleading causes, spinning yarns, feeding prize-oxen, shooting game, or poring over books—is the real upholder of England's might.

VERSES TO AN OLD FRIEND.

We will not meet again, old friend of mine!

Much of life's beauty hath already past,
And now I would not willingly resign

The spell thy memory can about me cast.
What I have been to thee, and thou to me,
Even since those old days wherein we met,
We ne'er could be again, if each should see,
How little of the past remaineth yet.

No, no! It were not well to learn how strange,
How all unlike thy heart and mine have grown;
To feel and know how sorrowful a change

Time and the world have wrought; weeping to
own

The fairest vision of our lives had fled.

I know we are not as we were; I know

How much, alas, of my past self is dead!

Therefore, old friend, we'll meet no more below!

How have the depths of bitterness been stirr'd

Within my soul since those departed days;

I, who could smile at every jesting word—

I, whom thy spirit at its will could raise

Up to its own proud heights of dreamy thought—

I, from whose sunny hopes, thy nobler mind

Fresh energy and inspiration caught—

How little of all this thou now would'st find!

I would be still to thee the same as then—

The bright, the gay, the fearless; I would be

To thy vex'd soul, amid the strife of men,

A joy and comfort; o'er the dreary sea

Of this unresting life I fain would bring

From the sweet promise-land of youth, some sign

Of hope, some token of that joyful spring

When time flowed sweetly as a hymn divine.

We will not meet again; for though I've clung,

As a fond child, to every lovely dream

We culled, like blossoms, when we two were

young,

Many have wither'd in the duller beam

That lights my pathway now, and we should feel

At once too bitterly that harshest truth—

That time, in our despite, hath power to steal

Such sympathy as bound our hearts in youth.

We will not meet again! I dare not look

Into the secrets of thy world-tried heart.

Remembering all thou wert, I ill could brook

To see a change in thee, if changed thou art;

Thou, from whose wisdom, breathed to me of old,

My soul has gather'd strength in hours of pain—

How could I bear to find thee dull and cold!

Old friend of mine, we must not meet again!

It may be that I wrong thee, thus to dread

Losing the comfort thy remembrance gives;

That through life's trials thou hast nobly sped,

And still thy lofty faith has lived and lives.

Forgive, if this be so, for I am weak

With many care-worn thoughts, and full of fear

Lest now thy voice in altered tones should speak,

Nor pour rich words of wisdom on mine ear.

We will not meet, and all that thou hast been

Thou still mayest be to me till life is o'er,

And I, my later griefs unknown, unseen,

Can still to thee be all I was of yore.

Thou, with thy wise and holy words, shalt bless

My lonely thoughts; and ever o'er thy soul,

Mine image, bright with youth and happiness,

Shall hold, in spite of time, its soft control.

Fraser's Mag.

From Fraser's Magazine.

POLICY OF THE BRITISH MINISTERS.

It is a strange feeling that comes over us when, for the first time in our lives, we find ourselves upon the descent of the Brenner, or the Simplon, or any other precipitous mountain-road, especially if, on the right hand or the left, there be a frightful chasm, into which a single jib or a start by the horses must inevitably plunge us. No matter how firm our confidence may be in the skill of the driver; no matter how decided the postmaster's assurances touching the steadiness and amiable tempers of the beasts that drag the carriage. Our nerves tingle and our breath fails us as often as we suffer our vision to wander down that horrible pit, which seems yawning to receive us; and, in spite of the sublimity of the scene, we are forced in the end—that is, supposing our constitutional temperament to be a delicate one—to lean back in our seat and close our eyes, committing ourselves, in a sort of collapse, to fortune, or to providence, or to any other invisible, but resistless, agency that may be in favor, to do with us exactly what it will.

We are not prepared to say that, with feelings altogether similar to these, the great Conservative party, who brought the present ministers into power, regard at this moment their own position and the proceedings of their master. There is much of hope mixed up with the alarm which generally pervades them. They are satisfied that the coachman is skilful in his vocation, and has nerve enough for anything. They admit, likewise, that his style of driving is suitable to the path on which they have entered; and, therefore, trust, and, indeed, believe, that they will be carried through the pass without sustaining hurt; but it would be absurd to deny that they heartily wish themselves out of it. The whole scene, and their own plight in regard to it, is so new, so unexpected, that they are at a loss how to sustain the nervous agitation that is caused by it. Let us drop this metaphor, however, and in plain, downright English, set forth what we mean to say to the readers of *Regina*, leaving them to draw their own inferences from the facts which may be brought before them; for of facts, more than of theories, it is our intention to speak.

Time was when the watchwords of the Tory party were:—in England, "Our glorious Constitution in church and state;"—in Ireland, "Protestant Ascendancy," with an occasional reference, especially after dinner, to "the pious, glorious, and immortal memory of ——" no matter whom. We speak now of days when Sir Robert Peel was a young man—a subordinate in that ministry of which the late Earl of Liverpool was at the head, and John, Earl of Eldon, lord-chancellor of England, the main prop and stay. Then was Mother Church not only mighty, but rampant. Then was the statute-book graced by enactments which denied to Papists all the privileges of citizenship, save protection to life and property alone; and rendered it incumbent on such as might aspire to seats in the house of commons to have received at least once, previously to the day of election, the sacrament of the Lord's Supper in the church of the parish where they might be resident. The agricultural interest, too, was in high favor then; for the ports were closed against foreign corn, till after the price of that grown at home should have exceeded eighty shillings per quarter. Nor let it

be supposed that the trade and commerce of the country were neglected. Very far from it. English silks were saved from the competition of foreigners by import duties, which amounted to a prohibition. English cotton and woollen goods, English cutlery, porcelain, hats, shoes—everything, in short, of home manufacture, was protected; not by the skill of the fabricators, but by the interference of laws, which closed the home market against strangers. Meanwhile the shipping interests, the West India interests, the Canadian interests, the East India Company's interests, were all bolstered up as stoutly and carefully as the votes of houses of parliament could do it. Protection, indeed, was the order of the day;—protection to life and property by the free use of the gallows to the church, by a steady depression of Dissenters; to commerce and navigation, by a thousand restrictive duties; to the aristocracy, by a careful denial of representatives to populous places, and a tender fostering of such constituencies as were found in Gotton, Sandwich, and Old Sarum. And the faintest intimation of a desire to change that system, especially in regard to the election of members of parliament, was denounced as symptomatic of those levelling views which are directed constantly and with eagerness towards a democratic form of government.

The great principle of the Liverpool administration may be described as the "Do-nothing principle." "Let well alone," was their favorite maxim; and, as long as it continued to be well, perhaps a little longer, the *vis inertiae* was kept in steady operation. There were, however, even in the Liverpool cabinet, men to whom a state of absolute rest was not a state of absolute happiness. Canning, and Huskisson, and their friends, desired change; and, though faithful to parliament as it then existed, and as much opposed to reform as the duke himself, they forced their colleagues into the repeal of the navigation-laws, as well as to the general admission, that wherever a system of reciprocity could be established, free-trade offered greater advantages to all parties than its opposite. For this, however, the old tory party hated them. How eloquent were the *Standards* and *Morning Herald's* of those days in their denunciations of measures which persons of greater weight in the country than they felt to be but the beginning of an end! And how gallant, too, was the resistance of the tory section in the cabinet. Catholic Emancipation! the repeal of the test and corporation acts! free-trade! the theories of political economists! the very sound of the words fell like discord on the ears of the Eldons and Peels of the period of which we are speaking. And so it came to pass that, till the liberals, as they were called, had, by the hand of death or otherwise, been purged wholly out of the cabinet, no steps were taken to innovate seriously upon arrangements which custom had matured, and to which long use, it was supposed, had reconciled the nation.

Another peculiarity of the times of which we are now speaking, ay, and of days less distant, was, that the worst kind of taxation was asserted to be that which makes its appeal directly to the pockets of the payers; which takes money, apparently for nought, and so renders the state a copartner in every man's earnings and property. Assessed taxes men brought themselves to endure, though not without an effort; because they bore exclusively upon luxuries, and were paid on account of conveniencies which the payers, if they chose, might do without, and which were con-

spicuous to the world. But even assessed taxes were not popular with the statesmen who imposed them, and were retained on no other plea than that of dire necessity. Hence soap, candles, tea, sugar, malt, beer, wine, bread, salt, leather, dye-stuffs—every article, in short, of consumption, every necessary of life, to the poor as well as to the rich, bore its burden. And the arguments of such as ventured to hint at a different arrangement were met, first, by the assertion that there was no injustice in the arrangement at all; and next, that if there were, it was better that men should pay to the state through their grocers, their hatters, and their shoemakers, than through the most unpopular of all public functionaries, the common tax-gatherer. Well do we remember, so recently as the year 1829, when an honorable gentleman, now in parliament, suggested a change in regard to this matter, that his proposition was met by the minister with a brevity and vigor of expression which had more the air of determination than of courteousness about it. However, time was running his ceaseless course all this while, and changes of various kinds came round upon his chariot-wheels.

Sir Robert Peel, the Duke of Wellington, Lord Eldon, and their party, refused to take office under Mr. Canning, because he was avowedly favorable to the removal of what were called the Catholic disabilities. The old tory party praised them for this on their retirement, and bore them back again with loud shouts, after the death of Canning and the weakness of his successors opened to them once more the gates of Downing-street. They came into office one year, and the very next test and corporation acts and Catholic disabilities went by the board. Had they taken another step in advance, we are not prepared to say that they would have insured to themselves a perpetuity of power; but there can be no doubt now that their proceedings in the matter of the East Retford question, followed up by the duke's memorable declaration against parliamentary reform, were the proximate causes of that terrible convulsion, from the effects of which this country has not yet recovered. The whigs came in, and with them the triumph of liberal principles, as far as it suited the convenience of professed liberals to broach these principles; yet the whigs neither dared to speak of endowments for the Roman Catholic church in Ireland, nor dreamed of revolutionizing either the commercial or the fiscal arrangements of the empire. Many changes they certainly introduced into the *constitution*, properly so called, of the country; but the manner of working it in detail, the system of management in the several portions of the United Kingdom, the church, both here and elsewhere, and, above all, the principle of taxation, these, when compelled to quit office, they left pretty much as they had found them. Let us see what has befallen since; and how a conservative cabinet, backed up and supported by the most powerful party that ever forced its chiefs into office, has, in regard to these matters, comported itself.

There is no denying that the present government took office at a period of extraordinary danger and difficulty to the country. Disastrous wars abroad; seditious movements, but little removed from rebellion, at home; ruined commerce, and a revenue falling off from quarter to quarter; all bespoke a state of things which was not to be met by common measures of amendment. The new

government felt this, and acted upon the conviction. Warned by the total failure of the policy of their predecessors, they determined to hazard a complete change of system, and they were encouraged to do so by the assurance that dwelt upon their minds that their will would be accepted as law by the nation. How, indeed, could the case be otherwise? Their majorities in the two houses of parliament were overwhelming. True, the measures which they had considered and matured were not likely to please their own friends, or, at all events, some of them. But what of that? Their friends *dare* not leave them, for, if they did, the consequence would be an immediate return to office of the clique towards whom they had taught themselves to feel as Hannibal felt towards the Romans. And as to the opposition, first, they were numerically too feeble to be much accounted of; and, next, they must become false to their own principles, and so degrade themselves in the eyes of the whole world, if they refused to support attempts, which it was assumed that they had meditated, perhaps yearned and longed to make, but which, well knowing the strength of the party that would have gainsaid them, they had not hardihood, perhaps patriotism, enough to propose.

The putting down of the repeal movement in Ireland, with the trials, bungled as they were, that followed, were measures entirely after the good old tory heart; there was no reserve in the applause wherewith that master-stroke of policy was greeted. But may we predicate as much in regard either to the tariff of 1842 or the imposition at that time of an income-tax? Perhaps not. Nevertheless, the measures were proposed and carried; and the conservatives, or tories, felt that, from that hour, the ground on which they used once upon a time to stand was no longer tenable.

The original tariff and income-tax were speedily followed by enactments more and more indicative of the fact that "old things were passing away," that "all things were become new." Ireland must be quieted; the demand for a repeal of the union must be put to silence; and there were but two means whereby this end could be accomplished. Half a century ago, or less—may we not say five-and-twenty years ago, at the utmost!—the Irish people would have been told that, if they persisted in disturbing the public peace, they should suffer for it. And suffer for it they would have done. For, unless our memory be much at fault, the Duke of Wellington in the lords, and Sir Robert Peel in the commons, gave to all concerned something like a pledge to this effect, when, in 1829, after passing the emancipation act, they declared, "that, should the measure unfortunately fail of producing the results which they anticipated from it, they would be the first to ask from parliament such powers as should enable them to vindicate the outraged majesty of the law." Now we need not say that, if by the language which they then held, our illustrious leaders intended to prophesy a long season of content and submission in Ireland, they proved no more than that they had not been gifted with the art of vaticination. Ireland has never been so turbulent, so entirely unmanageable, as since the Roman Catholics carried that point, the surrender of which was counted upon, ere the event befell, as the sure forerunner of peace, and plenty, and gratitude, and the very height of loyalty, in that portion of her majesty's dominions. However, it would be unfair to keep

out of view that many other causes than the one have contributed to produce this. Thirteen or fourteen years of whig management, during which the government depended from week to week for its existence on men avowedly hostile to all the established institutions of the country, could not fail of creating in Ireland a spirit which we do not know how to describe, lest we should seem to labor under the influence of a delusion. It is enough when we remind our readers that the tables were turned with a vengeance; that it was no longer Protestant, but Popish ascendancy which sober-minded men found cause to dread; that laws yet unrepealed were violated openly, and the violation sanctioned by the authorities of the day; and that the consequence was a thorough dislocation of the whole framework of society. How the whigs can have the effrontery to speak of the repeal movement as originating in the return of the tories to power would, indeed, surprise us, if anything that occurs in party strife were a legitimate cause of wonder to the lookers-on. The repeal movement was in full operation long before the weakness of Lord Melbourne's cabinet had become apparent beyond the limits of parliament, and would have operated far more effectually than it did, either at Clontarf or anywhere else, but for the providential removal from the sovereign's councils of men who, let their intentions be as upright as they might, were without power to carry them into execution.

There was no alternative to Sir Robert Peel, in reducing Ireland to a state of rest and comparative obedience to the laws, except either to govern with a rod of iron, or to conciliate the great body of the people, by behaving generously to them on their most tender point. To effect the former, he must have prevailed upon parliament to suspend the constitution in the sister island, and to coerce and restrain its inhabitants by martial law, and an army of 150,000 men. Now, apart from all considerations of moral right and moral wrong, these are arrangements much more easily talked about than accomplished. We do not believe that a proposal of the sort would have been listened to in either house; we are very sure that in the present cabinet there is not a man who ever dreamed of making it. For, be it observed, that there is no doing work like this by halves. You must have penal laws against the Roman Catholic religion, otherwise failure is certain. You must go back to the days of William III., or the Duke of Cumberland, and treat Papists as these worthies treated the Episcopalians of Scotland, each in his generation, reacting the massacres of Glencoe and Culloden, only on a larger scale, or you will do nothing. Now neither Sir Robert Peel nor Lord John Russell would tolerate such things. How, then, was the minister to act?

And here let us observe, that we are arrived at the summit of the Brenner pass. We know that it is necessary to descend; yet it would be ridiculous to deny that the first movement which the carriage makes towards the plains of Bavaria agitates us exceedingly. The charitable endowments bill was a bold measure. We praised it at the time, and we repeat our praises now; but it certainly made us, and, we suspect, the whole tory party, feel queer. In Ireland it has wrought much good, not unminged with a little evil. We are sorry to see that our Protestant brethren there too much denounce it. We can make many allowances for them, but in this we are satisfied

that they are wrong. And now behold what follows! The queen's speech having lightly paved the way, the minister seizes the earliest opportunity of announcing that the education of candidates for holy orders, according to the rites of the Roman Catholic church in Ireland, shall henceforth be carried on at the public expense. Fed, clothed, and boarded by the public these young aspirants for the cowl and the tonsor may not be; but all the appliances of learning are to be provided for them out of a grant from government; and Maynooth, enlarged and enriched, yet no wise remodelled, either in its constitution or privileges, is to be the scene of their religious and intellectual training.

The carriage has taken another dash downwards. Safe we still believe it to be; but there is a chasm close to the road, over which it makes us dizzy to gaze, though we cannot shut our eyes to it. Sir Robert Peel does right in facilitating the better education of the Irish Roman Catholic priesthood. Till this is done, and benefices assured to them afterwards, less repulsive to good taste, good feeling, and personal independence, than the contributions of the poor, it is vain to expect that *gentlemen* will become ministers in the church of the majority in Ireland. Plenty of talent there will always be, with some scholarship—not much; some slight acquaintance with the dead languages, and an abundant stock of bigotry; but Maynooth as it was, and the P.P. parishes as they are, never could have produced such a body of priests as should deserve the respect of the higher orders, or become guides to the lower in those moral duties of the present life which best fit men for happiness in another. Indeed, it is a well-known fact, that ever since Maynooth was established, the characters of the Roman Catholic clergy in Ireland, and their influence for good, have steadily deteriorated. We are old enough to remember the Romish priests of the old school, men of good families and liberal views, who, trained at some of the foreign universities, most of them at Douay in France, brought back with them to their pastoral office at home, not only the manners, but the feelings and desires of well-bred gentlemen. Not one of them now remains. Mr. Pitt's horror of republican principles, having been barely strong enough to come between the Irish gentry and the foreign education of which we are speaking, gave them Maynooth in its room, and so stunted the gift, that it ceased to have value in the eyes of any except the sons of the peasantry. It was a charge against Jeroboam, who "made Israel to sin," that he "took of the lowest of the people, and made them priests of God." The selfsame accusation lies against the founders and supporters of Maynooth up to the present time; for verily the priests which go forth from that seminary have all been taken from the very lowest of the people.

And here the question arises, how far has Sir Robert Peel judged wisely in continuing to Maynooth a monopoly, so to speak, of the education of young men designed for the service of the Romish church in Ireland? If Maynooth was to be continued at all, the wisdom of largely increasing the grant for its maintenance does not admit of a doubt. But the real problem to be solved is, why should this seminary be kept up? Doubtless there are good reasons for this, of which we are ignorant. Probably the minister, having made up his mind to do a gracious thing, put a further re-

straint upon his own wishes, in order that it might be done with as much grace as possible. And, if it be true that the Roman Catholics of Ireland prefer the present to any other arrangement that could have been made, there is an end, we presume, to all argument on the subject. But these are points which we do not find ourselves bound to take for granted; and, therefore, heartily going along with him in the *animus* by which he is swayed, we feel ourselves at liberty to doubt the wisdom of the minister's actual proceedings.

If we Protestants be right in our belief that men continue Papists only through ignorance and prejudice, it surely seems to follow that we should desire as much as possible to communicate to them the knowledge which they lack, and to overcome their prejudices. Now the obvious method of accomplishing this end is to make them as much as possible sharers in our own system of education. We do not mean to argue that, either in England or in Ireland, it could be desirable, or even just, to throw open to Roman Catholics, or Dissenters of any kind, the endowments of our colleges, which are, by their constitution, inseparably connected with the Established Church. But why there should not be in Great Britain, as there is in Prussia, universities with mixed faculties, wherein men of both creeds might pursue their general studies together, going to their respective professors of theology for theological instruction, is what we have never been able to comprehend. Let us not be misunderstood. The English universities have so completely departed from the spirit, and, indeed, the form, in which they were founded, that to append to either a seminary wherein members of the church of Rome might pursue their studies, is impossible. But the same objection does not apply to Dublin, far less to any new university which government might found, and pious individuals foster, in other parts of Ireland. And we frankly confess, that the adoption of some plan of the sort would have been more acceptable to us than that on which the minister seems to have determined in regard to Maynooth.

At the same time, we do not condemn an arrangement of which we cannot see all the bearings, or even the sources. If it be true, for example, as we know is asserted, that by the terms of the act of Union the government is bound to support Maynooth, then has Sir Robert Peel come to a wise determination, in adding to the amount of the grant annually made to it. But was he likewise bound to keep it precisely as he found it? Could he not, even now, add a Protestant college to the college as it exists—giving to both higher privileges, and placing both upon a better footing?

So much for deeds actually done. We have, under a tory government, recognized the Church of Rome in Ireland as a church. We speak no more of ministers of the Romish persuasion; but, in commissions issued from the crown, address ourselves to "The Most Reverend Archbishop Murray," and "The Right Reverend Bishop."

Again: We pass an act of parliament whereby pious individuals professing the Romish faith are empowered to endow benefices, and build Roman Catholic places of worship, at their pleasure. Thus an end is put to that fiction in law which denied the existence of the Church of Rome within these kingdoms. So far from prohibiting the Romish clergy to officiate in public, we permit them to become bodies corporate; and, like our

own vicars and rectors, to hold property as corporations whole, so long as time shall last. Moreover, if we do not negotiate directly with the pope, we give a sanction to the promulgation of one of his bulls in this our Protestant realm; and very much rejoice to find that it enjoins on the Romish clergy that, which all our laws failed to command—an abstinence from political agitation, and the steady devotion of their time and talents to the duties of their calling. And, lastly, that other symptoms of change may not be wanting, the head of the party which so long resisted emancipation proposes a grant of many thousands annually for the better education of Roman Catholic priests; and, if not cheered, is certainly not turned round upon or denounced by the party for having done so.

Are we annoyed at all this? Do we blame it? By no means. Sir Robert Peel is pursuing, according to our poor judgment, the only course which holds out a prospect of peace for Ireland, and, as a necessary consequence, for the United Kingdom. He is acting justly towards the majority, and with exceeding policy towards the minority, of the population of Ireland. But we acknowledge, nevertheless, that we are on a rapid descent on the hill-side, and that our nerves are somewhat shaken by it. Who will undertake to give a pledge, that in ten years, or twenty at the most, the Roman Catholic Church shall not be established in Ireland? Be it so. This is the risk. And, if it do come, we must try to make the best of it. But we are not at all disposed to say that it *must* come.

And now let us look a little to other matters. It is not in regard to churches and to the education of the people alone that the wheel is going round. It seems to us that the financial system of the country is in the balance. Formerly, men's theory was, that indirect taxation was greatly preferable to direct taxation. We may be wrong; but we fancy that this notion is, with many others, getting out of date; and, on the whole, perhaps properly so.

The income-tax has been repealed for three years; and, that no doubt may remain touching the minister's design of desiring a further renewal, when these three years shall have expired, an amended tariff keeps pace with the arrangement, and trade is set free from a great many more of its shackles. Export duties are to be levied no more. Raw cotton, and other elements of manufacture, are to enter our ports duty free; and glass, and we know not how many *fabriques* besides, rejoice in an exemption from taxation. Sugar, also, one of the great necessaries of life to the poor, is to be so lightened, that it shall pass from the grocer's shop into the cups of the consumers at something about one penny farthing per pound cheaper than it used to be. And the grand result is, that the trade of the country is to be relieved from the pressure of three millions of annual taxation, for which the income-tax, though taken at five millions, will, according to the estimated expenditure for the ensuing year, barely compensate, with a trifling balance in favor of the exchequer of ninety or a hundred thousand pounds.

The minister has not said, of course, that at the termination of three years he will certainly propose a further prolongation of the income-tax. On the contrary, he cheers the house with the same sort of assurance that he gave them three years ago, namely, that whenever the finances of

the country will bear it, he shall remit the tax; and that, perhaps, the increased facilities afforded to commerce may enable him to gratify both himself and the country in this way three years hence. We quite believe him. We do not doubt that, if it were possible to maintain the public credit, and keep the wheel of government going without the imposition of taxes of any kind, Sir Robert Peel would propose their total abolition. But this is not possible, neither is it at all probable that trade can take such a start within three years, as to bring in, by means of the reduced duties, an increase of five millions sterling to the treasury. Our chances of getting rid of the income-tax through the operation of ordinary causes seems, therefore, to us to be small indeed. But supposing these causes to operate, and the returns from the customs and excise to go beyond their former productiveness to the amount of five millions, or more, is it therefore certain that the income-tax shall cease? We think not. Manufacturers and trading gentlemen generally resemble, in more ways than one, the monster in the tale of *Vathek*, who though fed with little children, never seemed to get his belly full. If reductions in duties to the amount of three millions add so much to their gains that they can afford to pay five millions for them, how much will they not gain provided the three-million reduction become six? Besides, though four hundred and thirty articles be exempt, there remain still four hundred, and more, to be released in like manner. Will not the tea-merchant assert, and with reason, that he has the same claim to consideration with the sugar-merchant? And are we to put out of view altogether the corn-merchant, the most oppressed of all importers—at least, in the opinion of the League? Surely not. Surely, this experiment, if it prove as successful as the last, will lead to another, and another, till the brightest dream of the economist is realized, and trade left free to find its own level, unbolstered by protecting duties on the one hand, and unshackled by drawbacks and restrictive impositions on the other.

Once more, therefore, we cannot disguise from ourselves, that the carriage is rushing down the pass at a tremendous rate. Not that we object either to the pace or the position. The former, though rapid, will carry us the sooner through our perils; the latter, though beset with some dangers, has a considerable touch of security in it too, and we will tell our readers where to look for it.

The evident tendency of the new system of taxation (for a new system has arisen, and will be carried out vigorously) is to relieve, as much as possible, the poorer classes, and to lay the burden upon the richer. All *direct* taxation seeks this end, provided it do not degenerate into a poll-tax: for to tax property is to tax directly: and, even if there were no line beneath which the tax-gatherer were forbidden to go, the heavy end of the property-tax must, in the very nature of things, be borne by such as possess the largest share of this world's goods. And he who cannot perceive that the present government is gradually substituting direct for indirect taxes must be very short-sighted indeed. So far, therefore, we think that the minister deserves both approval and support. And though the views which we are disposed to take of the operations of an income, as contradistinguished from a property-tax, may not, perhaps, prove popular, we shall not, therefore, hesitate to give them.

The objections to the present device are, that it operates unfairly; that it exacts as much from the annuitant and the professional man as from the landed proprietor or the fundholder; and that, in regard to men in trade, the inquisitorial nature of the surveillance to which they are liable is intolerable; and that, after all, the grossest injustice prevails both for and against the tax-payer. We do not think that anybody has objected seriously to the standard, as the legislature has settled it. Persons worth barely 150*l.* a-year are generally of opinion that 200*l.* would have been a better line; but there is a sort of suspicion on our minds that if 200*l.* had been taken, the same argument would have held—ay, and been repeated at 400*l.* and 500*l.*, and perhaps 1000*l.* We will conclude, therefore, that the 150*l.* line is a fair one; and so address ourselves to the matter in dispute between income and property.

And here, the first question which occurs to us is, what do men mean by property? If you and I possess each ten thousand pounds, and you, being a man of moderate wishes, invest your capital in the funds, or the purchase of land; while I, envious of higher things, go to Manchester, and purchase a mill, and become a manufacturer, does it therefore follow that my property ceases to be property because it makes thrice the return that yours does? and would it be fair, while you paid three per cent. on your three hundred a-year to the state, that I should pay nothing on my twelve hundred? The truth is, that the capital which men embark in trade is not only property, in every sense of the term, as much as the moneyed man's money and the landed proprietor's land, but it is that which theirs is not—improvable property, accumulative property—property that goes on increasing itself, and therefore of twice the worth of theirs, even at the outset. True, the merchant and trader have many risks to encounter; for, though a wealthy man to-day, he may be a beggar to-morrow. But whose doing is this? He prefers the risk of loss and the chance of gain to the quiet of repose. Is he, therefore, a fit subject for exemption from those burdens which the necessities of the state impose upon its subjects?

No, it will be said; but, in truth, merchants and traders seldom know what they are worth. Their returns may be great for awhile; but, supposing circumstances to arise which shall induce them to wind up the concern, it may come to pass, not only that their incomes are terribly diminished, but that they find it impossible to realize even the amount of capital which they brought with them originally to the concern. Is it fair, then, to tax them from year to year upon an income which has no more solid foundation to rest upon than luck or the current of trade?

We really think that it is quite fair. Subject they doubtless are to all the contingencies that are here enumerated, but they are not the only classes of persons whom contingencies of the sort affect. A fall in the funds would reduce the property of the fund-holder; to a less extent, perhaps, but still sufficiently so to place him, in regard to principle, on the same footing with the trader. And, as to land, the frequency with which, within the last thirty years, it has changed its owners, and the prodigious fluctuations in value to which it has been liable, show that not even when standing on our own dirty acres can we tell, within many thousand pounds, what we are worth. The only difference, indeed, between us and the merchant is,

that while we can, he cannot always leave his business to his children, or keep it from breaking down in his own hands. But, so far as regards the returns which it makes to him on his capital, it must be a very poor business, indeed, if it do not pay a better interest than either the three per cents or the very best of the marsh lands in Lincolnshire or the Isle of Ely. Besides, in proportion to the diminution of the incomes of both, the tax-gatherer's demand becomes less startling; and if, unfortunately, we sink below the line of 150*l.* we shall both of us become exempt altogether.

Well, but the very existence of a trader may depend upon the maintenance of his credit; and hence your prying tax compels him, in very many instances, to pay for a larger income than he receives. Or if he be a thorough-paced curmudgeon, he will make his returns as small as he can, and so cheat the state, while he cultivates habits of falsehood and knavery in his own bosom.

Both propositions are admitted; but what then? The legislature cannot help either result. If men are so dishonest as to describe themselves to be that which they are not, what power on earth is there to prevent it! For he who makes a false return in order to bolster up a failing credit deserves to pay for his whistle; indeed, the chances are that, in his case, the law is doing good to many, inasmuch as it is hurrying forward a crisis which cannot come too soon. The bane of this, and of all other commercial countries, is the readiness with which men, virtually insolvent, are kept above water till they contrive to drag down hundreds with them. We cannot pay the smallest heed to men who wilfully represent themselves to be in a flourishing condition when they know that they are on the eve of bankruptcy. And as to your curmudgeon, the fact that he is able to cheat the tax-gatherer, even if it be at the expense of his personal honor, proves that the law is neither so inquisitorial, nor so inflexible as it is generally represented to be. But this is not all.

The opponents of the income-tax have no objection to impose burdens upon realized property. They object only to an arrangement which treats the uncertain profits of trade and life-incomes as if they were of equal value with the rents of land or half-yearly dividends. We admit that, if you look to the individuals, neither a profession which brings annually a thousand pounds, nor a business which clears as much, is half so desirable as a landed estate or a capital invested in the three per cents, each of which makes a similar return. But the state, we apprehend, cannot view the matter in this light. The object of all governments is to preserve order and to afford adequate protection to the life and property of the subject. Now order and good government are doubtless necessary to the quiet enjoyment by the land-owner of his rents, and by the fund-owner of his dividends. But are they not, at least, as necessary to the merchant and the professional man? Nay, are not the two latter more dependent on good government by far than the two former? Suppose the machine of state to get out of order. Such a result seldom arrives in a day; but suppose the symptoms of a revolution to become so manifest that nobody can avoid to notice them, who is in the worse plight then, the land-owner or the merchant, the professional man or the fund-owner? Surely the merchant and the professional man. Landed estates have survived many revolutions, and continued in the families of their ancient proprietors. The prudent fund-owner, when he sees the storm com-

ing, will sell out, at a great loss doubtless, but still for something, and withdraw with the wreck of his property to some better land. But what becomes of the merchant and the professional man? The former is beggared at once; the latter finds that his clients, or patients, or parishioners, as the case may be, have something else to do with their money than to pay his tithes or fees. And so he finds himself suddenly, though a man of consummate talent and enterprise, cast out into the street. We think, then, that merchants and professional men, when they complain of the injustice of an income-tax, are forgetful of the one great purpose for which all taxation is imposed. They do not take into account that of the various classes of society they stand the most in need of the protection which a good government affords, and that to grumble because they are requested to contribute equally with other classes towards its maintenance is to show themselves not very grateful for the protection which they enjoy.

Again, one obvious consequence of the remission of the tax on income, and the substitution in its room of a tax on realized property, would be that the amount of realized property in this country would diminish from day to day. Who would keep his capital locked up in the funds in order that a percentage from it might be applied to the uses of the state, while all who chose to embark theirs in speculation or trade were excepted from the impost? Land, to be sure, must remain; and if you think it just to tax land, and not to tax the profits of cotton mills and Chinese adventures, the land must pay. But the price of stocks will very soon tumble down under such a system to the lowest figure, inasmuch as every holder that can, will realize his property, and, should things come to the worst, purchase with it Pennsylvania bonds: that is, supposing the drab men to have the effrontery to bring any more of their waste-paper into the money-market. The obvious consequence of a tax on realized property, to the exemption of mere income, from whatever source derived, would therefore be extreme confusion in the money-market, and an eager rushing by all classes into trade, out of which would come national disgrace and universal beggary.

It appears, then, to us that, having fairly changed his system, having seen the exact point beyond which indirect taxation could not be carried, having had the boldness to avow this, and to shape his plans accordingly, Sir Robert Peel has entered upon the one course which held out a prospect of permanent security to the throne and to the great institutions of the country. For his income-tax is sure to become more and more productive, in proportion as the trade and commerce of the empire extend. We will venture to predict that the effect of the removal of the duty on glass alone will be to set up scores of glass manufactories, each of which will turn out a profitable concern, and by the tax on its profits add to the surplus of the next year's revenue. And as to the weaving and working up of cotton, and the impulse that is about to be given to the sugar-trade, we cannot speak in terms too sanguine as to our anticipations concerning them. Moreover, we feel that we are yet only in the beginning of things. Other indirect taxes will go; and, through the relief which their removal affords, we shall not feel the weight of the income-tax, though we may marvel to behold how, from year to year, it goes on increasing in its productiveness.

One argument more there is in favor of the new

system, which has probably occurred, are we particularize it, to most of our readers. There is no kind of tax so easy of collection—so little expensive to the state—so little dangerous to public morals, as an income-tax. Falling as it does upon persons in a certain station of life, you have a right to assume that they will make, for the most part, an honest declaration of their means, and pay without—or not, perhaps, without reluctance—but certainly without equivocation, as the seasons of payment come round. A body of collectors, comparatively small in point of numbers, will get the whole in; and a moderate percentage on the sums collected will repay them for their trouble. Whereas customs and excise not only require whole armies of officers to do their bidding, but are the fruitful sources of dishonesty, sometimes of violence, in many quarters. We cannot hope that the day will ever arrive, when we shall be able to pay the public creditor, and defray the ordinary expenses of the state, without both customs and excise. But the less we depend upon them for the realization of the revenue the better it will be for the moral as well as the physical well-being of the masses, who, being less able to resist temptation than their superiors, ought, by a wise government, to be more guarded from its influence.

If we have succeeded in making our meaning plain, the readers of *Regina* will understand that, in our humble opinion, the whole frame-work of society in this country is in a state of transition. The changes proposed seem, moreover, to be good in many respects; and the manner in which they are conducted is both considerate and wise. We shall have no revolution; no more nonsense about People's Charters, Parliamentary Reform, Repeal of the Union, and suchlike; but a gradual though steady settling down of old tory opinions and prejudices, and a thorough alteration in matters, both civil and ecclesiastical, which, twenty years ago, were supposed to be immovable as the hills. We are content to abide the issue; and, though somewhat dizzy, as we have more than once taken occasion to observe, full of hope that we shall yet reach the plain, without any damage to our horses, ourselves, or even hurt to the carriage.

From the Colonial Magazine.

AN EXCURSION TO A CACAO OR CHOCOLATE PLANTATION IN THE WEST INDIES.

SOME years back, while residing in the town of Port-of-Spain, the capital of the island of Trinidad, one fine morning at daylight, which begins there a little after five, I mounted my hardy Venezuelan pony, and started off at a brisk canter, for the purpose of spending a few days with my excellent and esteemed friend, the mayor-domo or manager of Reconocimiento cacao, or chocolate plantation, situate about twenty miles off, in the heights of the quarter or district of Arauca. I had despatched my gun and portmanteau, on the day before, by a trusty black. After a smart and delightful ride of nearly two hours along an excellent road, having handsome sugar-plantations on both sides of it, I arrived at an establishment called "The Pens," a sort of better half-way house, on the road to Reconocimiento, about fourteen miles from Port-of-Spain, at the foot of the northern range of mountains of Trinidad, and on their southern side. This place was a dependency of the plantation for which I was bound, and consisted of a few acres of land

in pasture and of the house, which was a very good and commodious one of two stories, having large store-rooms in the lower one, which served as a depôt for the produce from the estate above, until it should be forwarded to market in the town. As there was good shooting along my road, I resolved to leave my pony here until my return, and proceed on foot. Having six miles farther to travel, and that entirely through woods and precipitous mountains, an excellent cup of *café-au-lait*, and some American cracker-biscuits with plenty of fresh butter—the latter being a great rarity in the island—I found most acceptable. This first breakfast over, I clad myself in my shooting habiliments, and struck into the woods by a narrow path, the only one to the plantation, and which could only be used as a bridle-and-foot one. I went alone, for the way was familiar to me from having been several times before along it. I shall not stop here to describe the grandeur of the Arauca forests; suffice it to state, that they are composed of nature's choicest selection of tree and shrub, among which a variety of animals roam, and numerous birds of varied hue and plumage, worthy of such a dwelling, abide and disport. I wended my way leisurely, now bringing down a brace of parrots from a flock of those noisy creatures, as they would clamorously fly across, or sit feeding among the branches above my head. At another time, diverging a little from my path, enticed by their cooing, I would bag a scallop-necked pigeon, or a mountain dove. While in quest of an agouti, or Indian rabbit, which I had espied not far off, I shot a prehensile porcupine, which required a second and a third shot to bring it down, so fast did it cling to a branch with its tail. A herd of pearies or wild hogs crossed me at too great a distance for destruction; but a brace of pawies, which are a sort of wild turkey, I succeeded in adding to my stock of game. The road was exceedingly rich in the picturesque. It was, as it were, a kind of forest-clad *Bolan*-pass, for the most part; now crossing a deep ravine, presently ascending and winding along a ledge affording hardly room to proceed even with the greatest caution, and anon leading across a roaring torrent, and then a gentle stream, while innumerable shrill-toned birds and cricketing insects, drowning the lamentations of the plaintive dove, lent to the feelings of romance which were raised by the ever-varying locality.

I at length reached the plantation. Reconocimiento, (in English, *Gratitude*,) like the lovely but rare virtue which its name represents, bursts suddenly and brightly upon one's view, when at last found, and not the less so from its being unexpected. On coming thus suddenly upon it, it has the appearance of one vast forest-orchard, if I may make use of the term, planted in the space formed by a hollow between two mountains, which have here receded a good deal more than they are wont to do at any other point. It is placed in what the West Indians term a punch-bowl—a designation which will give one a very good idea of its situation, if he supplies to it, in his mind's eye, the mouth of a milk-pot at two of its sides, to serve as an entrance on the one and an exit on the other. The mountains rise to, I should suppose, nearly 1,500 feet above the level of the cultivation, which is itself nearly 1000 feet above the level of the sea. One's sensations on reaching this calm and lovely spot, after a rugged and toilsome, although exciting, journey of six miles, are pleasurable in the extreme. The place appeared to me, on my first

visit to it, to be an earthly paradise, which the rugged and difficult nature of much of the road to it from below, had well prepared me to appreciate to its full.

I soon gained the dwelling-house of my kind host, which is a few hundred yards only from the commencement of the plantation. It was now about eleven o'clock in the forenoon, when I found him anxiously awaiting me, to partake with him a sumptuous second breakfast, or *tiffin*, as they call it in the East Indies, in which part of the world he had been. Having deposited my game with the cook, I was introduced to the doctor of the plantation, who had, like myself, come on a visit, although his was one of profit as well as pleasure. This son of Esculapius was not only a most agreeable companion, but could wield and thrust a boarspear almost as well as flourish the spatula, or dart the lancet. I did that justice to an ample spread, which no one but a pedestrian ever realizes in its fullest extent; the viands were both exotic and indigenous. A piece of roasted pecary flesh stood opposed to a cold ham of its near congener, the domestic swine; while curried fowl, and crayfish stewed in claret, flanked them. I need not say that the beverage of the gods was there—theobroma, chocolate of excellent flavor—and left us nothing to desire.

I shall not trouble the reader with any further account of several days most agreeably spent on Reconocimiento. What with hunting the pecary, shooting, fishing, bathing, and ranging through the delightful groves of the plantation, and occasionally lending a hand to the laborers, in helping them to pick the cacao fruit from the trees, I spent a most delightfully recreative sojourn. I shall now describe the estate in all particulars.

Reconocimiento is one of the largest cacao establishments in Trinidad. Its immediate cultivation, or that part of it which is actually planted, occupies a *vega** or bottom of land nearly a mile in length, and rather more than a quarter of a mile in breadth, the ground, however, having a sufficient declivity from the foot of the mountains—which, as I said before, almost entirely hem it in—to secure its perfect natural drainage into a rivulet, which, gently meandering through it, divides it into two slightly unequal parts. There were about 30,000 cacao-trees growing on this space and some newly-planted land on the adjacent hillside, and the produce of the estate, when I visited it, ranged from 1,000 to 1,200 fanegas of cacao, each fanega being a sack containing 150 lbs. It employed, as far as I recollect, forty effective slaves. This would give, at the rate of ten Spanish dollars per fanega, which was the then price, a gross return of from 10,000 to 12,000 dollars per annum, which, after a deduction of one-third for expenses, leaves a clear return, in round numbers, of from 6,500 to 8,000 dollars, equal to £1,300 English sterling money, in the first, and £1,500 in the second case. The profits of a cacao estate at Trinidad may be imagined to have been very great about the year 1816, a great many years before the time of my visit, when it is considered that the produce was then selling for as much as 25 dollars the fanega, more than double the price I speak of. In fact, to begin my account, *ab ovo*, Reconocimiento owes its existence to that very high price. It was originally reclaimed from the

forest by an old Spanish military officer, who, finding it difficult to carry on the war on a sugar-plantation which he possessed at the foot of the mountains below, and enticed by the magnificently handsome profits which the undertaking promised, achieved his views in the following manner:—

While the Spanish limbs of the law were pressing him in front of his old plantation, with their formal and tardy approaches, intent upon possessing and sacking it, like a wily and experienced old engineer-officer, as he was, he with great circumspection quietly withdrew, and retired up the valley in his rear. He succeeded, after much toil, in making an unperceived retreat with all his baggage, and ensconcing himself on the spot of his new hopes. The enemy fired a due quantity of petitions, replications, surrejoinders, and other legal shot, and having expended a great deal of breath in their war of words, were at last allowed to enter the gates of the citadel, consisting, at this stage of matters, of some falling buildings, and an old rusty sugar-mill on some worn-out land! Out of gratitude for his deliverance, the old man gave his new habitation its present name.

The whole of Reconocimiento, with the exception of a few acres of land towards its centre, and devoid of vegetation, may be described as being one entire forest, in no way distinguishable from the surrounding one but by the peculiarity of the cacao-trees themselves, and the tall erythrimas which serve to afford them shade and shelter. The space of unplanted land mentioned above, is in the form of a square, which is occupied, on part of two of its sides, by a most commodious dwelling-house, by the manager's and the overseer's house, and by the buildings requisite for drying and housing the produce; while, upon part of the opposite side, are the huts of the laborers, so contrived, by being screened behind foliage, as not to be perceived from the opposite buildings. With the exception of this square, in all other parts of the property, one is secluded in a delightful, almost impenetrable, shade. It will be sufficient to say, that all the buildings, as to situation, comfort and convenience, are such as were to be expected from one who could so ably and judiciously select the spot for this fine plantation.

In the rear of the dwelling-house there is a beautiful garden, consisting principally of flowers; but in it I perceived the English strawberry-plant, growing luxuriously, without, however, producing any fruit, which, I suppose, proceeded from a want of knowledge of the proper mode of cultivating it, as the temperature of the place is low enough to allow of its bearing tolerably. I here found the nights absolutely so cold as to disturb my sleep towards morning, although I used the covering of a blanket, in addition to the usual linen sheet of the West Indies. As far as I could judge, in the absence of a thermometer, the temperature must have ranged from 65° to 70° Fahrenheit, during the greater part of the night; in the middle of the day it was, I should think, 80° in the shade. No doubt, it is at times somewhat lower. At Port-of-Spain, which is on a level with, and close to the sea, the heat is generally about 77° during the night, and 84° during the day, in the shade, subject to slight fluctuations. Any one, however, curious enough to leave his bed at three or four o'clock in the morning, may, even at Port-of-Spain, in the months of January and February, observe the thermometer as low as 70°. The doctor informed me that Reconocimiento was remarkably healthy,

* Vega lands are rich flat lands, principally of alluvial soil, situated between a river and a mountain, and receiving the washings of the latter.

said that malignant fevers, such as occur in the low lands, were there unknown.

The cacao, or chocolate-tree, is known to botanists by the generic name of *Theobroma*, signifying, in the Greek language, food for a god; a name which was bestowed upon it by Linnæus, to mark his opinion of the excellent quality of its seeds. Benjoni, however, who travelled in the sixteenth century, formed a very different estimate of its merits, and declared that chocolate was a drink "fitter for a pig than a man;" an opinion for which nothing but gross ignorance could account, so totally false and absurd is it. I know it to be good for both; and not the less so for man, because it is exceedingly fattening for the swinish fraternity. There are three species of the *Theobroma*—the *Theobroma cacao*, of which I am now treating; the *Theobroma Gujanensis*, and the *Theobroma bicolor*; this genus belongs to the class *Polyadelphica*, and to the order *Pentagynia*. The sort under consideration is produced by a tree seldom rising above the height of twenty feet; it is equal in size to an orange-tree, and its leaves are large, oblong, and pointed. Herrera, the historian, compares the leaves with those of the chestnut-tree; but there is very little, if any, resemblance. The whole tree more resembles the cherry-tree than any other I can compare it with, the leaves, however, being infinitely larger than those of that plant. The flowers, which are small, and of a pale red color, spring from the large branches, and also from the trunk; they are succeeded by oval-pointed pods, grooved like a melon, and, indeed, not unlike that fruit, although the cacao-pod be smaller in girth than the melon. They contain a white pithy substance, which is of a sweetish, but sickeningly mawkish and disagreeable taste, and surrounds numerous seeds: these are the cacao of commerce. These seeds are oval-formed, and about as large as a moderate-sized almond-kernel, but not so slender; they are, internally, of a dark brown color, approaching to dun, and are covered with a thin skin or husk, of a light reddish-brown color. The nuts are very numerous, but vary in this respect, some pods containing as many as fifty, while others do not yield more than twenty seeds; they are, as is well known, of a very oily nature. The tree produces fruit twice a year, or rather its principal bearings are two, although it may be said to be never altogether without some pods on it. The trees are raised from seed, which is sown, in the first instance, in nurseries, shaded by the plantain or banana-tree. They are then transplanted in straight lines, so as to make a cross, or quincunx, formed by the junction of the apices of two triangles, or are arranged in the form of squares. The distance of the trees from each other is about fourteen feet in good soil, and about twelve in that which is inferior. Much nicety and judgment are necessary in selecting a soil and situation appropriate to this kind of produce. The Spaniards, who are the principal growers of cacao at Trinidad, do not trust to the results of analysis, to the color, or to any character or quality, except that derived from the luxuriance of the trees growing on it. The exposure should not be to the north, and the situation should be on the banks of a river, from which the benefits of irrigation may be derived when the seasons are too dry, and against any sudden overflow of which there are sufficient safeguards. A piece of land having been chosen, it is cleared of

all the natural vegetation. This is effected in several ways; but the most common is to cut down the wood, allow it to dry, very thoroughly, and then to burn it off. The plantation is then drained, and, if necessary, small trenches are cut so as to carry off all superabundant moisture; when all this was done, the land is ready to receive the cacao plants.

It is peculiarly necessary to defend this tree from the scorching rays of the sun, and at the same time sufficient warmth should be afforded to secure the vegetation. This is done by planting it, as before stated, with the plantain-tree and the erythrina, which answer all the objects desired. The cacao plants which are transplanted should not exceed three feet in height; where they are larger, they are less manageable, and more apt to die. The nurseries of the cacao require very fine land, well dressed, and free from wet. They should be sheltered from the sun. Small heaps of earth are collected, into which two seeds of the cacao are set; for the first twenty-four hours the heaps are covered with plantain-leaves. The ground is watered, if necessary, but no water is allowed to remain on it. The period best suited to this operation is in the month of November. When the two seeds in each heap have germinated, the weakest plant is destroyed, to give greater vigor to the remaining one. The plantain-trees should be carefully cut down when they become old, lest in their fall they should injure the cacao-trees. By the time the plantain-trees are cut down, the erythrina-tree, which is called by the Spaniards, French, and English by the respective names of *madre-del-cacao*, *bois-immortel*, and *coral tree*, has attained, from its rapid growth, a sufficient height to protect the cacao plant, and in five or six years becomes a lofty tree, affording a congenial shade to its protégée, which begins to bear fruit when three years old, and comes to perfection in about fifteen years, at which time it is from ten to fourteen feet in height.

It may be inquired why this particular plant is used to protect the cacao, in preference to any other. It is chosen on account of its affording the most agreeable covering. The cacao-tree, to prosper, although requiring little sun and light, yet, like all other plants, must have the exact quantum which its peculiar nature calls for. Other trees would afford it either too much or too little, but the erythrina seems to have been formed by nature as the maternal guardian of it, capable of ministering to all its exigencies, for which it is required, no doubt, by some hidden service to itself. There are two kinds of erythrina, one smooth, and the other prickly, both of which are used for the above purpose. It grows to the height of more than sixty feet, and its foliage is delicate and sparse, and of a light-green color. It entirely drops its leaves towards the end of the dry season, about the end of March or beginning of April, and then becomes covered with flowers of a bright crimson, and shaped like a cimier. At this season, an extensive plain covered with cacao-plantations, is a magnificent object when viewed from a height. The far-stretching forests of Erythrina present then the appearance of being clothed on the summit with flames, the fresh north-east trade-wind adding to the illusion, as it sweeps over their tops in apparent fleecy clouds of smoke. I must not omit to mention that a plantation of cacao has many enemies; deer, a small kind of

which are exceedingly plentiful at Trinidad, and squirrels and birds, are often very destructive to both tree and fruit.

Cacao is prepared for market in the following manner: the pod having been gathered from the tree by the hand, or by means of a hooked pole, where that mode is impracticable, from the branches being too high, it is collected into large heaps on the ground, and allowed to soften, or sweat, as it is termed by the planters, for three or four days. The pods are then opened, by means of a longitudinal cut, with a strong knife or bill, called a cacao-knife, or bill, and the seeds and pulp extracted with the fingers, and thrown into another heap, where the mass is allowed to sweat for two or three weeks more. At the end of this period, fermentation has loosened the seeds from their pulpy bed, when they are easily separated from it, and taken to the drying-house in baskets. The nuts are now daily spread in the sun upon a large cemented, or sometimes only carefully swept, esplanade, in front of the drying-house, where they are turned frequently and carefully, during the day; at night, they are again housed. The drying house is furnished with large trays, in which the cacao is received during the process of drying, and which can be run out at ports in the side of the building, when the uncertainty of the weather may render that plan advisable. The operation of drying is continued for about three weeks, more or less, according to the favorable or unfavorable state of the weather, when the nuts become sufficiently dry, and are packed for sale and shipment. Coarse bags, made of Oznaburgs sacking, having been prepared, each large enough to contain a fanega in weight, they are filled with the produce, which is now ready to be conveyed to market, in Port-of-Spain, on mules' backs, or in carts, as the nature of the roads will admit, where it is usually immediately sold, and shipped for Europe, as it is an article which deteriorates by keeping.

The cacao-tree is cultivated to a considerable extent in South and Central America; but, in the former country, by no means to the great extent that it was before the Declaration of Independence from the mother country, by its several republics. It is grown with great attention, and to a very large extent, in Mexico, where, Humboldt tells us, it was extensively reared, so far back as the time of Montezuma, and whence, it is supposed by him, to have been transplanted into the other former dependencies of the Spanish monarchy; an opinion which one may be allowed not to coincide in with that great man, since it has been ascertained by more recent travellers, that excellent cacao is to be found growing wild in the forests of the interior of British Guiana. The names whereby the plant, and the confection prepared from its seeds, are recognized at the present time, are, indeed, both derived from the Mexican language, a circumstance which might have been imagined to favor the supposition, but which of itself, obviously, is entitled to little weight. The tree is called by that people, *cacava quahuil*, the meaning of which I do not know, but which, is all probability, on reference to a vocabulary of the Mexican tongue, by those curious enough to do so, will be found to be descriptive of the nature or use of the plant. The confection, and the drink made with it, are termed *chocolatl*, a name which I am fortunate enough to know the origin of, with pretty certain accuracy. *Choco* is the Mexican-Indian word descriptive of a thick sound, such as is produced by beating or stir-

ring a thick liquid; and *latl* means drink, or beverage; so that the entire word, which suits the sense to the sound, exactly comes up to what we mean by a milled-drink, and what, in the West Indies, is yeleft, (although, however, in a more spirited practice,) "swizzle." But, should my friends be not satisfied with this verbal analysis, let them agree that the first component of the word is the name of the province of Choco, in Mexico, where chocolate was first most used as an article of food, of meat and drink. In the time of the Aztec kings, the seeds of the cacao were made use of as money in Mexico, a use to which they are still turned in some parts of it, the smaller seeds being employed for the purpose. The lowest denomination of coined money current in Mexico is a silver coin called a real, which is of the value of about fivepence; and, as there must arise many petty transactions of business to a lower amount, the convenience of these seeds, about sixty of which are reckoned as of the value of a real, must needs be very great. The best cacao is produced in the province of Soconusco, in Mexico, but the produce there is so small, that it barely supplies the people of property in that country, for which reason very little is sent to Europe, where that little brings an exorbitant price. The second kind in point of goodness, is that of Machala, Ironcoso, and Motoria, in the state of Guatemala; the fourth, that grown on the banks of the river Magdalena, in the republic of New Granada; the fifth, that of the island of Trinidad, and of which I now treat; the sixth, that of Caraccas, in the republic of Venezuela; and the seventh, that of Guayaquil. Europe, during the dominion of Spain over them, was chiefly supplied from the abundant crops of the two last places, but since their independence, a comparatively small quantity is exported by them. Trinidad now furnishes a large portion of the demand.

There are, besides the modern ones, several treatises on cacao and chocolate, which are curious and learned, by Bartholomew Marradon, who was a doctor of Marchena; Antonio Colmenero, of Ecija; and Dr. Philip Silvester Du Four. All of these authors agree in giving to chocolate, and all the other preparations from the cacao, a very high character for the possession of great nutritive qualities. I have myself personally used it a great deal, watching most narrowly its effects upon my system, and have always found in it a most wholesome, nourishing, and delicious refreshment, qualities which some have denied it, in their crude, captious, or fanciful attempts to decry it: the more it is used, with a real intention and spirit to allow one's palate and digestion to be their own unbiased judges, the more will it be appreciated. Foreigners know how to value it; why should not Englishmen do so to its full extent, except the reason be found in John Bull's old character for hesitation, in not adopting novelties, until the rest of Europe have almost got tired of them.

In conclusion, we recommend the Trinidadians and other West Indians who have investments in plantations of it, to stick to their cacao, for it is an easy, light, and gentlemanly culture and occupation, which a man could enact in pumps and silk stockings, and that without spoiling his complexion; although its price be not too encouraging; it is not one third of what it was in 1816. But, would it not be wise in them to represent their sufferings to the powers that be, in Downing-street, a little more frequently and energetically

than they seem yet to have done! Has the quaffing of theobroma in the West Indies the same effect on gods and men there, in making them oblivious of their interests, as Lethæan sources too often produce in higher regions, as respects the claims of large bodies of suffering men! Let the planters mind their game, and cacao will yet turn up as a large trump.

From the *Lancet*.

ON PRUSSIC ACID AS A POISON.

SEVERAL cases have lately been painfully brought before the public attention, in which prussic acid has been used for the purposes of suicide and of murder; the first feeling excited is that of surprise that the sale of so terrible a poison should be so unrestrictedly allowed; unless for some improper purpose, it can scarcely ever be required by the non-professional man, and the danger and skill demanded for its preparation would be some safeguard against its manufacture by any but chemists. The plea under which it is generally obtained is to destroy some animal; but the instantaneousness of the death produced by this acid, even in its most concentrated form, is much exaggerated. There is a short, but a very distinct interval between the taking of the poison and death: animals destroyed by it give a cry singularly expressive of pain, and are strongly convulsed from the apparently acute agony they suffer; nor do we think that even on the grounds of saving some old favorite animal pain it is preferable to laudanum, and yet only on this plea is it ever vended.

For suicide this poison has over all others this terrible advantage; when once the fatal phial is to the lips, no earthly power can stay the course. Antidotes are useless. Almost ere the alarm can be given the deed has been accomplished; and even if an antidote were at hand, with the quantity taken, in nine instances out of ten it would be useless; and when first taken the nervous system is so violently affected as to render the approach, even of a friendly hand, dangerous; the teeth are firmly fixed; and when the sufferer falls exhausted, the poison has spread too far into the system to be counteracted, even though the antidote were administered within the few seconds that life then remained.

In debarring the suicide from this deadly poison, we could not hope to prevent one determined to put an end to his existence from effecting his deadly purpose; we will admit this in its fullest extent to those who advocate its sale upon the grounds that were it forbidden, a plunge from a bridge at night, a rope, or a fall from some high place are still within his reach; or even if excluded from these, oxalic and other corrosive acids producing death with the most intense agony are still left. But the cause is here marked out: time in every poison, save this, is afforded to the sufferer to free others from suspicion, but here a method of murder is offered by which, if care is taken, it would scarcely be possible to detect the murderer—a sudden fall, a person is seen applying sal volatile, and all traces of the poison are immediately lost; suspicion would indeed scarcely arise; if it did, a country surgeon would recognize the familiar smell of ammonia. It is undoubtedly true, that even though united to ammonia, the presence of the acid might be shown by delicate tests; but the composition of prussic acid is against

any certainty; it can be produced from animal fibre or from blood; for the purposes of commerce it is procured by heating hoofs and potash in an iron crucible, and its extreme proneness to decomposition would present another still more serious difficulty; unless made from the ferro-prussiate of potash, it changes in a few hours into ammoniacal compounds. The cyanuret of potash prepared as advised by Professor Liebig, by heating the oxide of manganese with the ferro-prussiate of potash, in two hours commences to evolve ammoniacal vapors, and within the twenty-four hours is entirely decomposed; the deadly poison is by chemical combination changed into the stimulant, which undoubtedly is its most efficient antidote. It is true, the advance of science has rendered the evidence of chemists of a far different character from that tendered on the trial of Sir Theodosius Boughton, upon which the fact of poisoning by prussic acid was considered proved after an interval of seven years; the evidence then considered as most conclusive would now but expose the incapacity of the witness. In a late inquest, the fact of the surgeon not being aware of the ease with which this fatal poison could be made from urea and animal bodies, deteriorated his otherwise valuable evidence; and chemists are the more called upon for care, as the judges have lately considered it necessary to check the importance which chemical evidence so naturally exerted on the minds of the jury. The analytical chemist should not tender his evidence as if he regarded it as conclusive or otherwise of the guilt: in Madame Laffarge's case, the verdict depended upon the discovery by Professor Orfila of a minute portion of arsenic, which had escaped the researches of six experienced chemists, while that strong link of circumstantial evidence which established the guilt was comparatively overlooked; but here the poison can even perform its deadly task without being swallowed. Dr. Collier witnessed a case where a lady steeped some fur into the poison, and then endeavored to swallow it. The piece stuck in her throat, and though aid was immediately given, she perished. Had sal volatile been freely given, it would have been nearly impossible for any chemist, however skilled, to have recognized, by the most delicate test, the presence of this poison after a few days; yet Captain Donellan was executed for the murder of Sir Theodosius Boughton, by the administration of an essence of bitter almonds; now, the evidence of the existence of an extremely volatile poison could not, after seven years, have been depended upon; and the more particularly as the witnesses, without exception, fell into the serious error of asserting that the decay of the corpse commencing immediately after death was an undoubted proof of the administration of poison. Experience has since proved the gross inaccuracy of this absurd statement, yet in the summing up of the judge we find this assertion urged most strongly against the prisoner, while the strong and damning facts of his possession of a book giving instructions to prepare the poison, and the apparatus required to prepare it, with the sudden death of the young man to whose property he succeeded, were passed over. The death was here accompanied with great agony, and where the poison is so weak as to allow a struggle, the pain is evidently of a most severe character. The evidence of the witness on the inquest on Mrs. Belaney, most painfully showed this; the acid was here, indeed, so weak,

that had the slightest energy been displayed she might undoubtedly have been recovered. The judge, on the trial of this case, appeared to give but little weight to the evidence of the chemists and physicians, and this we fear will be even more strongly marked. We admit that the positions taken by the chemists and physicians would, if admitted, have superseded the necessity of legal inquiries; one of the most scientific stating, as in the case of Mr. Macnaughton, that the mind of a man capable of committing a murder could not be in a sound state, and that the criminal required the application of medical instead of legal correction, to renew the harmony between the passions and their counterbalancing faculties.

The prussic acid, prepared as directed by the Pharmacopeia, is very dilute, containing two per cent. only of the acid. The strength of Scheele's which is continually referred to by physicians, is not known, the professor having in his form omitted to state the quantity to be distilled over. The first quarter of an hour would, therefore, if the operation were carefully conducted, yield an acid, three drops of which would destroy a small animal; while that prepared by another chemist who would continue the distillation for several hours would be weaker than the dilute acid directed by the Pharmacopeia. This great difference in the preparation of the acid has produced several fatal accidents, particularly in France, where, to secure uniformity, Gay Lussac introduced the plan of producing acid of the highest possible strength. Cyanuret of mercury was decomposed by the addition of its own weight of strong hydrochloric acid; the receiver was kept cool in ice and salt, the acid distilled by the gentlest heat passing over dry chloride of lime to absorb the excess of water; in this way an acid is procured the inhalation of which is sufficient, during the trifling escape inseparable from the most careful distillation, to produce headache, and occasionally stupefaction; flies near it are observed to fall dead, and while transferring it to a bottle the operator is forced to hold his breath. Acid of this terrific strength is not kept by any chemist in England. Majendie, the celebrated French physiologist, on the other hand, recommended an acid weaker than that prepared by our Pharmacopeia, mixed with a syrup; but at his own hospital the dreadful preparation of Gay Lussac was administered for his own; the medicine was poured out and swallowed, and nine or ten had taken the dose before the fatal convulsions of the first patients showed the mistake. Remedies were immediately given, and some, we believe three, were saved; but as if a fatality was to be attached to this medicine, no sooner is it recognized by physicians and admitted into our Pharmacopeia, and every chemist required to keep it, than we find it the general weapon for murder or for suicide; and though an unobjectionable form is given in the Pharmacopeia, physicians still adhere to the uncertain form of Scheele. The advocates of the strong acid have but to increase the dose of the Pharmacopeia preparation to ten drops, to satisfy themselves that giddiness and other signs of too large a dose are produced by this, the dilute acid, with the same certainty as with even the strong acid of Gay Lussac.

Prussic acid consists of charcoal, hydrogen, and nitrogen; the known affinity of the two latter to form ammonia is the cause of the tendency of the acid to be decomposed, and the cyanate of ammonia being itself a very volatile salt, renders its trace still more evanescent.

COOKING AND LIVING IN PARIS.

THE following is an extract of a letter from Mr. Weed to the Albany Evening Journal;

"Nothing about Paris strikes a stranger with more surprise than the quiet manner of conducting its business. You see little or nothing of the noise and bustle of other great cities. Neither the hum of commerce nor the din of manufactures are heard. There is more stir about the basin at Albany, with greater demonstrations of business, than is to be met with in all Paris. You even wonder how such a vast population are supplied with provisions; and the wonder how they all support themselves is much greater. We, however, are strangers to the rigid system and habits of economy that prevail here. I am assured by an intelligent American, who has been long here, that the expense of victualling Paris, with its million of mouths, does not exceed that of victualling New York. Nothing is wasted here, while in New York enough is thrown away daily to feed a hundred thousand Parisians. French science in cooking is everything to Paris. Many of their most delicate, as well as their most frequent dishes, are made of things which we reject as garbage. Many of their most delicious soups are compounded of materials which we have never dreamed of eating. Indeed, there is no part of a creature, from its horns to its hoofs, out of which the French will not serve you up a savory dish. I came here with a determination to eschew the refinements in French cookery, but my resolutions and prejudices have yielded, day by day, and dish after dish, until I now eat whatever is set before me, taking care to smother all that looks like horse steak, cat stew, or rat pie, in tomatoes. I have eaten as many varieties of soups, since I came to Paris, as there are sub-divisions in a New England sermon, or verses in a chapter of the Book of Chronicles; and for the most part I must say that these 'pottages' are excellent. With beef and vegetables, a French cook will serve you a capital dinner, in three courses, for one franc. The tendency of French cooking is to diminish the quantity of meat, and to increase the proportions of bread and vegetables consumed; and another and more important result of the perfection of their art, is to greatly diminish the expenses of living. Bread and wine, or perhaps I should say wine and bread, are the staples of life in France. You see Frenchmen in cafés, in gardens, and by the road side, dining not only contentedly but cheerfully, upon red wine and dry bread. I look from my window into the apartment of a humble French family, who dine daily from a single soup, with wine and bread. The bread here, for families, is baked in rolls a yard long, and stands by the table with one end upon the floor, while the other rests against the wall. In commencing dinner, the master or mistress of the family cuts a slice, and then passes the loaf round the table, each cutting for themselves, and then the roll is again placed upright against the wall.

"It is said that from thirty to fifty thousand of the inhabitants of Paris rise in the morning without knowing where or how they are to get either a breakfast or dinner. This class, for the most part, neither work nor beg, but in some way or another, enough sticks to their fingers, during the day, to enable them to procure the necessaries of life—wine and bread."

From the Polytechnic Review.

THE UNIVERSAL SALVAGE COMPANY.

SINCE our last number, this company has so far advanced, that it is most probable that it will be enabled to come into early operation; we have read with much attention the prospectus it has placed before the public, and we have no doubt, whatever, that to a maritime and commercial nation it is likely to prove of the highest value; the following extract is one that will be considered conclusive:—

"The history of the casualties of the royal and commercial navies of this great maritime country affords melancholy proof of the immense losses annually sustained by shipwreck. Indeed, so great is the amount of treasure and valuable property sacrificed to the sea, that the wrecks which lie submerged in the seas of Europe, especially on the coast, within the latitudes of 36 and 56 degrees north, and in known localities, are calculated to contain property to a greater amount than could be found in a tangible shape upon the surface of the two kingdoms of Spain and Portugal. This immense treasure receives constant augmentation from wrecks occurring upon the different coasts of Europe to the estimated amount of about four millions annually; and these wrecks, in many instances, occasion other wrecks from the obstructions, and especially the foul anchorage, caused by them, when ships are sunk on anchorage ground. In the years 1835-6, this interesting and important subject was investigated by a committee of the house of commons, who, in making their inquiries, selected two periods of three years each, viz. first, from 1816 to 1818 inclusively; and secondly, from 1833 to 1835 inclusively; and reported according to Lloyd's books, that, in the first period, the total number of ships or vessels wrecked or missing appeared to be 1203; and in the second period 1703. About the middle of the last century, one hundred vessels were lost in a single gale of wind at the port of Cadiz.

"These facts sufficiently demonstrate the magnitude of the losses occurring from vessels wrecked at sea, and the importance of any attempt to retrieve them. Such attempts have not been unfrequent; and the most usual have been by means of the diving-bell. In the year 1683, (about a century after the first exhibition of the diving-bell in Europe before the emperor Charles V. of Germany,) William Phipps, founder of the noble house of Mulgrave and Normanby, formed a subscription, to which the famous General Monk, Duke of Albemarle, largely contributed, for searching and unloading a Spanish galleon, sunk about forty-five years previously, on the coast of Hispaniola (St. Domingo.) After one or two failures, Mr. Phipps succeeded, and returned in 1687 to England, with treasure amounting to 300,000*l.* sterling. The tenth part accrued to the king; the Duke of Albemarle's share was 90,000*l.*; and subscribers of 100*l.* received 10,000*l.* each from the adventure. Large, however, as was the fruit of this enterprise, the result obtained from the use of the diving-bell, in cases of salvage, is but partial and incomplete; nor is it improbable that an amount of treasure remained in the galleon, after the operations of Mr. Phipps, larger than that which was recovered by him."

If a survey were made of the wrecks which surround the coasts of the United Kingdom, similar

to the one made of wrecked vessels on the coral reefs round the small island of Anagada, West Indies, by order of the house of commons, in 1824, such a survey would astonish the world that so much valuable property should have lain so long, and almost daily increasing by other wrecks, within the immediate reach of the first maritime nation, without any effectual means, on a large scale, being adopted to recover them. We frequently read that such a vessel has sunk, the crew saved or drowned as the case may be, the public lament the occurrence, the parties interested set about recovering the loss of property from the underwriters, the claim is adjusted, and both parties endeavor to forget the catastrophe as soon as possible; although the vessel, worth several thousand pounds, has sunk in twenty fathoms water only, her position easily ascertained, every facility to pass chains round her to recover her, nevertheless there she lays given up as lost forever. Take, for instance, the Phoenix steamer, sunk off Dungeness, and many others we could mention; it is to be remembered also that several vessels of war lay sunk at Spithead upwards of fifty years, and that it is only within the last few years, that the application of the galvanic battery and the improved diving dress, induced the government to recover the effects of part of those vessels by means of the tedious and dangerous process of diving, and by the former to destroy the vessels by blowing them to pieces, creating vast labor to recover the fragments. Many persons imagine that when a vessel has sunk she is immediately destroyed by the action of the waves; such generally is the case in very shoal water, on rocks, &c., but when the depth of water is beyond the swell or break of the sea, such vessel will remain whole for many years; for example, the numerous foreign vessels of war and others sunk many years back, whose position and condition are well ascertained; also the Mary Rose, one of Henry the Eighth's ships, sunk off Spithead near three hundred years back; the divers have visited her, ascertained her position, several guns have been raised from her, and they have reported that although she is covered with innumerable shellfish, she appears whole and in fair condition; and an opinion has been expressed by those capable of giving one, that she could be raised by the power of the atmosphere applied according to Mr. Edward Austin's patent method. Really, this is so interesting a subject that we must beg permission to call the attention of the scientific world to the fact that a vessel of so ancient construction lies in a moderate depth of water, within a short distance of the shore, that it is capable of being raised by the application of the above invention, and placed in one of her majesty's docks at Portsmouth.

Several individuals have lately, by means of the diving dress, realized considerable sums of money from wrecked vessels on the coast of Ireland, in the Mediterranean seas, the Azores, &c.; and one of the steam tug companies at Liverpool, during the last year, recovered a vast amount of cargo from wrecked vessels; and they placed in the hands of Lloyd's agents at that port upwards of £20,000 recovered from one vessel; also, during the last four years, another party has been working by the same means successfully in various parts of the Mediterranean. They visited the bay of Navarino, and recovered several brass guns

from the Turkish vessels of war sunk in that port (upwards of 100 including the transports.) The Greek government had employed their divers previously to the depth of nine fathoms, which was their limit, when the parties alluded to arrived and carried on their operations to eleven fathoms; but the pressure of the water became so great and distressing to the men that they could not descend to a greater depth, and the pursuit was given up, leaving immense wealth untouched, and the more wealthy and large ships sunk in deeper water, and in still weather are easily discerned. The same divers entered into a contract with the Turkish government to receive fifty per cent. on all they recovered from their vessels. They operated by the same means on the Turkish admiral's ship, on board of which the wealthy Turks had placed their treasure during the revolt at Scio; this vessel took fire and sunk; from it they recovered much valuable plate and a brass gun weighing between six and seven tons. These successful ventures have been kept quiet for certain reasons, but such and similar facts clearly prove that if parties with limited means and power can accomplish so much, there is an ample field open for the "Universal Salvage Company," with capital and unlimited lifting power, to realize immense wealth; for they are unshackled by any expensive machinery or establishment. Their operations are expeditious and economical; having accurately ascertained the value of the proposed ship to be raised, her exact position by their simple and ingenious method by buoys on the surface of the water, the probable expense to accomplish the object is easily known. The large per centages of thirty-three and one-third per cent. which the salvors are entitled to by law, must, if their business be conducted with common prudence, enable them to pay a large dividend on their shares as well as to restore a vast amount of property to underwriters and others, who, in many instances, have been ruined by the sad and melancholy catastrophe, shipwreck.

Another important feature proposed by this company is to establish a steam vessel, or more, in a position, especially during the winter months, that is likely to be of essential service to ships in distress entering the Downs or the river Thames. Numerous are the instances of vessels perishing, with their crews, in sight of hundreds of spectators on shore, without possibility of aid being rendered them by the present means; and although there are upwards of thirty steam vessels employed as tugs on the river Thames, strange to say, there is not one of them fitted with proper anchorage gear, or the means to recover them in rough weather, or to continue for any time in a gale of wind exposed to the action of the sea without being herself destroyed; therefore, it is impossible that such vessels can render assistance to a ship in bad weather. These are facts beyond contradiction, and are well known to the pilots; we therefore hail with satisfaction the proposal that a steam vessel be constructed, combining all the late improvements, and capable of continuing under weigh in severe weather to render assistance to ships on entering the Thames, which, no doubt, will be the means of saving many valuable lives and much property; and from the sums of money realized occasionally by the class of vessels just described, the expectation is justified that a handsome profit will be obtained on the capital so employed.

A Brief Sketch of the Life of Joseph Lancaster. Including the introduction of his System of Education. By WILLIAM CORSTON. 18mo.

[THE Eclectic Review has an article on Dr. Bell and Joseph Lancaster. Having so lately had a long notice of the former in the Living Age, we omit most of that part of the review.]

Joseph Lancaster was born in Kent Street, Southwark, on the 27th of November, 1778. His father was a Chelsea pensioner, who had served in the British army during the American war. To the pious example and early instruction of his parents he always attributed, under the divine blessing, any acquaintance he possessed with the power of religion. "My first impressions," he says, "of the beauty of the Christian religion were received from their instructions." There is a touching beauty in his own account of himself as a little child, retiring to a corner, repeating the name of Jesus, and as often reverently bowing to it. "I seemed to feel," he says, "that it was the name of one I loved, and to whom my heart performed reverence. I departed from my retirement well satisfied with what I had been doing, and I never remembered it but with delight." This little incident was an epitome of the man, and, inconsistent as it may seem to be with his future religious profession as a member of the society of Friends, it truly shadowed forth the enthusiastic, not to say passionate feeling, which through life so eminently characterized him.

At the early age of eight years he was pondering the Gospels in secret retirement and delight, his heart "filled with love and devotion to God," with "breathings of good-will to the human race," and with "desires to devote his life to the service of God." At fourteen, Clarkson's Essay on the Slave Trade came in his way, and alone, and without taking counsel of any one, he determined to go to Jamaica, to teach the poor blacks to read the word of God. Mr. Corston's narrative of this adventure is so brief and simple that it scarcely admits of condensation:—

"With a view to accomplish his purpose, he left home for Bristol, without the knowledge of his parents, having only a Bible, Pilgrim's Progress, and a few shillings in his pocket. The first night he slept under a hedge, and the next under a hay-stack. On his journey, he fell in with a mechanic who was likewise going to Bristol. They walked together; and as Joseph's money was all expended, his companion sustained him. On arriving at his destination, he was pennyless, and almost shoeless. He entered himself as a volunteer; and was sent to Milford Haven the next morning. On board, he was at first the object of much ridicule, and was contemptuously styled *parson*. The captain being absent one day, the officers asked him if he would preach them a sermon. He replied, 'Yes, if you will give me leave to go below for half an hour to read my Bible.' They said, 'O certainly, an hour if you choose.'" When he came up, there was a cask placed upon deck, and the ship's company were all assembled. Having placed him upon the cask he proceeded to lecture them upon their habits of profane swearing, drunkenness, &c., at first much to their mirth and amusement; but after a little they began to droop their heads, when he told them if they would leave off these wretched practices, repent, and turn to the Lord, they might still be

happy here and happy hereafter. After this sermon, he was treated kindly—no one was suffered to laugh at him, or use him ill, during the three weeks he remained on board.

“His return home to his parents was occasioned as follows:—a dissenting minister at Clapham, happening to call in at his mother’s shop, found her weeping, and in great distress. On his kindly asking the cause, she informed him that her child had left home, and she knew not what was become of him. He endeavored to pacify and comfort her with the hope that the Lord would restore him to her: and then inquired where she thought he was gone. She replied—‘Why, we think to the West Indies. He has felt much and talked much about the poor blacks lately, from having read Mr. Clarkson’s book about them.’ ‘O come, my good woman,’ she rejoined, ‘take comfort. I am intimate with the captain of the Port Admiral’s ship, at Plymouth. I live at Clapham. Should you hear of your son, let me know.’ In about three weeks, a letter was received from Joseph—his parents informed the minister—he wrote to the captain, and Joseph was soon sent home with a new suit of clothes, money in his pocket, and his carriage paid by coach.”—pp. 2, 3.

Between this period, and that of his attaining the age of eighteen, he seems to have been an assistant at two schools, one a boarding, the other a day school; and thus, as he afterwards states in a letter to Dr. Bell, he became acquainted with all the defects attendant on the old system of tuition in both kinds of schools. At eighteen he commenced teaching on his own account in his father’s house, and the following description of the undertaking, extracted from an old report of the Borough Road School, is from his own pen. It refers to the year 1798.

“The undertaking was begun under the hospitable roof of an affectionate parent: my father gave the school-room rent free, and after fitting up the forms and desks myself, I had the pleasure, before I was eighteen, of having near ninety children under instruction, many of whom I educated free of expense. As the number of scholars continued to increase I soon had occasion to rent larger premises.

“A season of scarcity brought the wants of poor families closely under my notice: at this time a number of very liberal persons enabled me to feed the hungry children. In the course of this happy exertion, I became intimately acquainted with the state of many industrious poor families, whose necessities had prevented the payment of the small price of their children’s tuition, some of whom had accumulated arrears for many weeks. In every such case I remitted the arrears and continued the children’s instruction free of expense.

“The state of the poor, combined with the feelings of my mind, had now blended the pay school with a free school. Two benevolent private friends had been in the habit of paying for five or six poor children at the low price I had fixed as the assize of education or mental bread for my neighborhood. I easily induced these friends to place the money they gave, *as pay*, in the form of a subscription.”—pp. 6, 7.

On the outside of his schoolroom he placed the following printed notice:—“All that will may send their children and have them educated freely; and those that do not wish to have education for nothing, may pay for it if they please.” This

filled his school; but, as might have been expected, left his income scarcely adequate to his own board and comforts.

As the number of his pupils increased, a new schoolroom became necessary. It was provided, chiefly through the benevolent aid of the late Duke of Bedford and Lord Somerville, “who,” says Lancaster, “appeared to be sent by Providence to open wide before me the portals of usefulness for the good of the poor.” “The children,” he adds, “now came in for education like flocks of sheep; and the number so greatly increased, as to place me in that state which is the mother of invention. The old plan of education, in which I had been hitherto conversant, was daily proved inadequate to the purposes of instruction on a large scale. In every respect *I had to explore a new and untrodden path*. My continual endeavors have been happily crowned with success.”

[Here the reviewer gives a long account of the origin of the controversy between Bell and Lancaster, which we omit.]

With renewed pleasure we now resume the narrative of Lancaster’s *progress*, associated as his efforts ever must be with the subsequent spread of knowledge, the growth and enlargement of the popular mind, and the moral and intellectual improvement of the laboring classes of society in these realms. Even his enemies were constrained to allow (no mean praise) that to him—to his “zeal, ingenuity and perseverance,” were to be attributed the awakening of the public mind to the duty of caring for the instruction of the poor, and the exhibition of an agency by which it could be promptly, economically, and efficiently accomplished.

We left him busy in the new room for which he was mainly indebted to the late Duke of Bedford—a thousand children daily gathering for instruction, and a few friends supporting him by their annual subscriptions. Nothing can be more beautiful than the account given of his position and character at this time. He was always domesticated with his pupils. In their play hours he was their companion and their friend. He accompanied them in bands of two, three, and (on one occasion) of five hundred at once, to the environs of London for amusement and instruction.

Nor did he care only for their intellectual necessities. Distress and privation were abroad:—he raised contributions, went to market, and, between the intervals of school, presided at dinner with sixty or eighty of the most needy of his flock. “The character of benefactor he scarce thought about; it was absorbed in that of teacher and friend. On Sunday evenings, he would have large companies of pupils to tea, and after mutually enjoying a very pleasant intercourse, would conclude with reading a portion of the sacred writings in a reverential manner. Some of the pupils would vary the exercise occasionally by reading select pieces of religious poetry, and their teacher would at times add such advice and observations, as the conduct of individuals, or the beauty and importance of the subject required. Is it any wonder that with pupils so trained, to whom so many endearing occasions presented, evidences should abound of affection, docility and improvement? In them he had many ready coöperators, and, however incapable of forming designs, never were agents more prompt and willing to execute.” These were his best and most joyous days.

Happy would it have been for him, though certainly not for mankind, had he never emerged from this scene of humble, quiet usefulness, into the turbulence of a world, which distracted him by its excitement, injured him by its praise, and finally, cast him off for faults of which itself had been the parent.

He was now rapidly becoming an object of public attention. His school-room was visited by "foreign princes, ambassadors, peers, commoners, ladies of distinction, bishops and archbishops;" his publications were passing rapidly through editions, each larger than its predecessor; his school, ably and zealously conducted by youths trained under his own eye, and imbued with his own enthusiastic spirit, was forsaken for lectures in all the principal towns of the kingdom, in every part of which he was received with the most marked and flattering attentions from all classes; even the monarch did not disdain to admit him, uncovered, to his presence, but sustained, encouraged and applauded him. This interview, which took place at Weymouth in 1805, is described by Mr. Corston, and is too characteristic to be omitted.

"On entering the royal presence, the king said: 'Lancaster, I have sent for you to give me an account of your System of Education, which I hear has met with opposition. One master teach five hundred children at the same time! How do you keep them in order, Lancaster?' Lancaster replied, 'Please thy majesty, by the same principle thy majesty's army is kept in order—by the word of command.' His majesty replied, 'Good, good; it does not require an aged general to give the command—one of younger years can do it.' Lancaster observed, that, in his schools, the teaching branch was performed by youths who acted as young monitors. The king assented, and said, 'Good.' Lancaster then described his system; and he informed me that they all paid great attention, and were highly delighted; and as soon as he had finished, his majesty said: 'Lancaster, I highly approve of your system, and it is my wish that every poor child in my dominions should be taught to read the Bible; I will do anything you wish to promote this object.' 'Please thy majesty,' said Lancaster, 'if the system meets thy majesty's approbation, I can go through the country and lecture on the system, and have no doubt, but in a few months, I shall be able to give thy majesty an account where ten thousand poor children are being educated, and some of my youths instructing them.' His majesty immediately replied: 'Lancaster, I will subscribe £100 annually; and,' addressing the queen, 'you shall subscribe £50, Charlotte; and the princesses, £25 each;' and then added, 'Lancaster, you may have the money directly.' Lancaster observed: 'Please thy majesty, that will be setting thy nobles a good example.' The royal party appeared to smile at this observation; but the queen observed to his majesty, 'How cruel it is that enemies should be found who endeavor to hinder his progress in so good a work.' To which the king replied; 'Charlotte, a good man seeks his reward in the world to come.' Joseph then withdrew."

At this time money appeared to him to be flowing in, in a perpetual stream. Unaccustomed to its management, and ignorant of its value, he expended it with thoughtless profusion, if not with sinful extravagance. He was, in fact, at this period in so high a state of excitement as to be totally unfit to manage his pecuniary affairs.

"The day after to-morrow," he writes from the country to a friend, "is my birth-day. I am nine and twenty. I wish *all my children* to have a plumb-pudding and roast beef; do order it for them, and spend a happy hour in the evening with them, as thou didst this time last year, in my absence in Ireland; *furnish them with money*, and when the good Samaritan comes again he will repay thee." And so he went on. Yet, as might be expected, not without many severe trials and struggles. A faithful and valued friend, still living, who never forsook him either in evil report or good report, and to whom he was largely indebted through life for pecuniary aid, has related to us his own singular introduction to him, which took place about this time. Having heard of Lancaster and his system, he says:—"I called at his school to inquire about the training of a teacher, and after some conversation relating to the necessary arrangements for the man's attendance, I slipped a ten-pound note into his hand as an acknowledgment of my obligations. What was my astonishment to see this quiet man, with whom I had a moment before been calmly conversing, at once turn pale, tremble, stand fixed as a statue, and then, flinging himself upon my shoulder, burst into a flood of tears, exclaiming, 'Friend, thou knewest it not, but God hath sent thee to keep me from a gaol, and to preserve my system from ruin!'"

And this was the state in which he lived for years—excited, enthusiastic, the creature of impulse and passion—his zeal "eating him up," his judgment weak and oftentimes perverted. His letters to his friend Corston, without doubt, faithfully reveal the "inner man," and they are always excited, imaginative, and passionate, sometimes enlivened by a tinge of humor oddly contrasting with depression and melancholy. The alternations of hope and fear in his mind are here seen to be rapid and powerful. Yesterday, "bile, fatigue and grief overwhelm" him; to-day, he has "the valley of Achor for a door of hope." At one time, the "iron hand of affliction and sorrow is upon him," and he is "throwing himself at the footstool of his Saviour and his God, pleading his promises, pleading his fulness, pleading his wants, and *there* resolving to succeed or perish." At another time, he is exalted, "telling the high and mighty ones that the decree of Heaven hath gone forth, that the poor youth of these nations shall be educated, and it is out of the power of man to reverse it." One day, he is "peaceful and resigned," feeling that he is "sent into the world to do and to suffer the will of God," and welcoming "sufferings and the cross as the path the Saviour trod." The next, he is shouting "victory, victory, the enemies are amazed and confounded; the stout-hearted are spoiled; they have slept their sleep; none of the men of might have found their hands: the Lord hath cast the horse and his rider into a deep sleep."

To his enthusiastic and imaginative temperament things innumerable present themselves as "signal interferences." He "wonders at Providence" every step he takes. His friends will see "wonders next spring." The invisible power of God goes through him "far more sensibly than the circulation of blood through his veins." He is at Dover, and after attending two public meetings on education, holds a private conference with a select party; serious conversation takes place; "a solemn covering" comes over them—"it

seemed a power almost apostolic. After standing an hour amongst them, he closes with solemn prayer, "going boldly to the throne of grace in the sacred and powerful name of Jesus." He carries the same spirit into the world with him, and applies it, without discrimination, to his pecuniary circumstances. He is pressed for money, but he cannot believe that, "if the Almighty has designed the education of the poor of London, a few poor pitiless creditors can prevent it;" only let the eyes of his friends be opened, and they will see "the mountain full of horses of fire, and of chariots of fire, round about Elijah." He is in "watch and ward" arrested for debt, and in a spunging-house; he has been there three days, and no one has been to see him: but he is "as happy as Joseph was in the king's prison in Egypt." Corston visits him, and stays an hour or two with him. "After my departure," he says:—

"He rang for the sheriff's officer, to take him to the Bench; but obtained leave to call at home on their way thither. When he got home, his wife and child, and all his young monitors, were assembled, overwhelmed with grief because he was going to prison. After being with them a little, he opened the parlor door, and said to the man, 'Friend, when I am at home, I read the scriptures to my family; hast thou any objection to come in?' He replied, 'No, sir,' and went in. After he had read a chapter or two, he went to prayer. The man soon became deeply affected, and joined the common grief. After prayer the man returned into the other room, and Joseph in a few minutes said to him, 'Now, friend, I am ready for thee.' They had not gone many paces from the door, when the man said, 'Sir, have you got no friend to be bound for you for this debt?' Joseph replied, 'No, I have tried them all.' 'Well,' replied the man, 'then I'll be bound for you myself, for you are an honest man, I know.' He surrendered him at the King's Bench and they took his security for the debt. About ten o'clock the next morning, he came jumping into my warehouse, Ludgate Hill, saying, 'Ah, friend William, did I not tell thee that thou was not to assist me this time?'—pp. 35, 36.

This arrest brought matters to a crisis. A friendly docket was struck against him, and his creditors were called together. The result was, that in 1808 his affairs were transferred to trustees—a fixed sum was allowed for his private expenses—a correct account of all receipts and expenditures was for the first time kept; and shortly after an association was formed, originally entitled "the Royal Lancasterian Institution for promoting the Education of the Children of the Poor," and subsequently, for the sake of greater simplicity, comprehension, and brevity—the BRITISH AND FOREIGN SCHOOL SOCIETY.

Lancaster's affairs were indeed transferred to trustees, but the man remained unchanged. He was still the victim of his impulses. The excitement of his mind never subsided. The repression of his extravagance was to him an intolerable interference. One by one he quarrelled with his friends; then separated himself from the institution he had founded; commenced a private boarding school at Tooting; became still more deeply involved; went through the Gazette; and finally, wearied with strife and sorrow, sailed in the year 1818 for the new world.

For the few subsequent notices of his life and L. LIVING AGE. VOL. V. 12

character we are indebted to a manuscript communication from himself, which has been kindly placed in our hands in order to enable us to complete the sketch we have undertaken.

On his arrival in the States he was everywhere welcomed and honored as the friend of learning and of man. His lectures were numerous attended, and, for a time, all appeared to go well with him. But his popularity rapidly decayed. Rumors of debt and of discreditable pecuniary transactions in England, soon followed him; sickness, severe and long continued, wasted his family; and poverty, with her long train of ills, overtook him. Under these circumstances he was advised to try a warmer climate, and an opening having presented itself in Caraccas, he was assisted by his friends to proceed thither. He went with his son-in-law and daughter, (who afterwards settled in Mexico,) and, to use his own words, "was kindly received—promised great things, honored with the performance of little ones," and—after expressing, in no measured terms, his indignation at the breach of all the promises made to him—was glad to leave his family, and escape with his life. This was accomplished by a hasty flight into the interior, from whence he subsequently reached the sea shore, and embarked in a British vessel bound for St. Thomas.

During his stay in Caraccas he had entered a second time into the marriage state, and his account of the performance of the ceremony is curious, as being probably the only instance yet on record, of a Quaker wedding in South America.

The party met in Lancaster's school-room. At the time appointed General Bolivar with his leading officers and a large party of gentry and merchants assembled. "Bolivar's suite," he says, "were extremely puzzled at the large maps, some busying themselves with looking for Caraccas in Asia and in Africa. The ceremony commenced by the whole party being requested to sit in silence. After a time this was broken by a notary, reciting the names and connexions of the parties, and proclaiming that each had promised, in the fear of God, to take the other 'for better or worse, for richer or poorer,' and so on. The witnesses set their hands and seals to the contract—Bolivar signified his approval, and the marriage was regarded by all parties as binding."

After a short stay at Santa Cruz and St. Thomas, where again his lectures were attended by the governor and the gentry of the island, he returned to Philadelphia. Again sickness overtook him, and poverty, and much sorrow. In miserable lodgings, with an apparently dying wife, pinched by want, and pressed hard by difficulties of every kind, he appealed to the benevolent, and in addition to other aid, obtained a vote of 500 dollars from the corporation of New York. This enabled him to take a small house, and to recover strength.

He now determined to return to England, and all but agreed for his passage, when circumstances induced him to return through Canada. On his arrival at Montreal he commenced his lectures, and again for a time floated along the stream of popular favor. His worldly circumstances improved, and he determined to give up the thought of returning to England, and to settle in Canada. After a time, and probably through his own folly, he again sank, and then opened a private school for subsistence. In this school room he held "silent meetings" on "first days," sitting alone, while

his wife and family were gone to church. "Here," he touchingly says, "I sometimes found the chief things of the ancient mountains, and the precious things of the everlasting hills resting indeed on the head of Joseph, and on the crown of the head of him who was 'separated from his brethren,' by distance—by faults—by circumstances—and by the just but iron hand* of discipline. I longed again and again to come more and more under the purifying and baptizing power of the truth which had been the dew of my youth, and the hope of all my life in its best moments, whether of sorrow or of joy."

The last letter received from him was addressed to Mr. Corston, from New York, and dated 21st of 9th month, 1838. He was then in the enjoyment of an annuity which had been raised for him in England, chiefly by the exertions of the friend to whom we have already referred. His mind at this time was evidently as wild as ever, and his energies unbroken. He is still ready to undertake "to teach ten thousand children in different schools, not knowing their letters, all to read fluently in three weeks to three months." The "fire that kindled Elijah's sacrifice," has kindled his, and "all true Israelites" will, in time, see it. And so he runs on.

But his career was rapidly drawing to a close. He had fully resolved on a voyage to England; but about a week before the affecting accident occurred which occasioned his death, he expressed some doubts on the subject, saying, "He knew not the reason, but he could not see his way clear in leaving America."

On the 23d of October, 1838, he was run over in the streets of New York; his ribs were broken, and his head very much lacerated. He was immediately taken to the house of a friend, where he died "without a struggle, in the fifty-first year of his age."

In 1830 the health of Dr. Bell decidedly failed; and in 1831, Sir Benjamin Brodie stated his agreement with Dr. Newell in the opinion, that the nerves of the larynx were in a degree paralytic, as well as the organs of deglutition. His mind was, however, in full vigor, and his vanity as rampant as ever. "His money," says his biographer, "was now a burden to him." After changing his mind again and again as to its disposal, he at length suddenly transferred £120,000 to trustees at St. Andrews for a projected college. He then wrote to Dr. Southey, requesting that he and Mr. Wordsworth would edit his works, and begging their acceptance of £2,000, and all expenses paid, and the expenses of those they might employ. Southey accepts the trust, and incidentally refers to his own declining strength. "I am old enough myself," he says, "to have the end of my journey in view, and to feel what a blessing it will be to escape from the cares of this world, throw off the burden of human infirmities, and be united in the kingdom of heaven with those dear ones who have gone before us."

Dr. Southey very properly urged that as almost all his wealth had come from the church, some of it, at least, ought to return to it; and suggested to him a plan for augmenting poor livings. Dr. Bell at first seemed to acquiesce, but soon after altered his opinion. One twelfth of the amount he had placed in the hands of trustees (£10,000)

* He had been disowned by "the Friends" chiefly on account of his irregularities in money matters.

he subsequently gave to the Royal Naval School, and five other twelfths he transferred to the towns of Edinburgh, Leith, Glasgow, Aberdeen, and Inverness. His Scotch estates, producing a yearly rental of about £400, he made over to trustees for the purpose of promoting and encouraging the education of youth in Cupar Fife, subject to a miserable annuity of £100 per annum to his sister; £20 annually to six other persons; and £10 to Thomas Clark. His princely donation to St. Andrews proved most unfortunate; it involved him in disputes with the trustees, terminating only with his death, which took place at Cheltenham on the 27th of January, 1832, in the 79th year of his age. His remains were removed to London on the 9th of February, and deposited in Westminster Abbey on the 14th; the highest dignitaries of the church, and other eminent persons, attending as mourners.

The leading features of Dr. Bell's character have been so well portrayed by Mr. Bamford, that we cannot do better than extract from his "Notes." He is speaking of him as he appeared to the teachers with whom he constantly came in contact:—

"Acting as general inspector of all the schools united with the society, and anxious for the diffusion of his system, he apparently sacrificed every comfort, by continuing to undergo, in traversing from school to school, great bodily exertions and great mental excitements. The gratification which he derived from the display of a particular kind of knowledge, from the reception of praise and respect, the tribute due to his discovery and public reputation, encouraged and fed his restless vanity to such a degree, that his feelings, unless relieved by indulgence, would have made him intensely miserable. He had become so accustomed to bustle and change, and to new faces with new admiration, that he could never be happy for any length of time in one place. His fame, too, was spread, and a monument of renown erected by the establishment of every school. The fervor of travelling, and the excitement of fresh company, were necessary to carry off that exuberance of passion which, if not thus spent, would, I think—even if he were alone and in solitude—have accumulated and overflowed in vehement and fiery fits. Food, too, was continually required to nourish those notions of his self-importance which stationary friends, by too great intimacy, might neglect or refuse to gratify. It is true, that disregarding all personal care, and toil, and expense, wherever his services could be useful, however distant the place or unknown the applicants, no self-considerations restrained his zeal, or came into competition with his eager desire to bring his system into public notice and favor, and to keep up its character and reputation with others. In process of time, however, this craving for admiration from diversity of persons increased into a strong and overpowering feeling. It was not surprising, therefore, that he wrought himself into a belief that, as he was signally appointed by Providence to be the means of bringing to light such an instrument for the education of the body of the people, and the consummation of the blessed Reformation, so it was his duty personally to give his assistance whenever it was desired or likely to advance his great object. Still, perhaps, it had been better for himself and the cause in which he was engaged, either to have confined his instructions to fewer places, or to have communicated them with more grace. Previously to his arrival

in any town he was, from his public character and his disinterested employment, regarded as highly as his own pretensions could desire; but a first or second visit most commonly lessened the respect or checked the ardor of those who had given their time and money towards the establishment of the schools, and who found themselves and their labors frequently depreciated, censured, and offended. Many anxious friends of schools, who had welcomed his coming, in the hopes of being assisted and encouraged by the sanction of the discoverer of the system they were patronizing, became disgusted and disheartened, and have now either given up their interest in schools altogether, or only attend in spite of the reflection that he, who should best know and judge impartially, could find nothing to commend in their exertions. I do not mean to say that he found fault where there was no reason; but his manner of examining schools, and addressing visitors and masters, was in general so opposite to the courteous and complacent behavior by which great men become beloved, that many unkind feelings have been excited against him which he might very easily not only have prevented, but in their place have established unalloyed admiration. Instead of delivering his instructions and making his remarks in a gentlemanly and conciliatory mode, so as to gain upon adult masters by his suavity, his personal behavior was such that he was almost universally dreaded and disliked. His treatment of them in their schools, in the presence of their pupils, was frequently calculated to create any other sentiments than respect and attention. His conduct not only at the time alienated them from him, but it created a dislike which embittered and rendered heartless all their subsequent endeavors. It might be commonly true that there was ground for his observations; but his style of talking to them, and his remarks, with a kind of boundless rage and bluster, were, in their estimation, not only unkind and unnecessary, but vexatious and oppressive. These were evils which, in a great measure, he might have avoided, without exhibiting less earnestness or producing less benefits; besides, clothed as he was with authority, the tyranny was the more galling.

His passion for money was inordinate, and it deservedly brought upon him, especially in his management of Sherburn Hospital, annoyance and obloquy. His views of human nature were affected by this propensity, and were consequently low and mean:—

“He regarded money as the *primum mobile*, and only efficient stimulant in the world. He excited masters by a negative kind of threat. He did not say, ‘Do this, and you shall have so much beyond your regular and fixed salary;’ which at best might be barely sufficient to command the necessaries of life—but, ‘Do this, or you shall be melted, or lose your situation.’ He would have had all the masters under such an arbitrary kind of control, that if the school did not weekly and monthly increase in numbers, and order, and attendance, and improve in progress, the masters should be subject to weekly and monthly fines, and be paid according to the periodical state of the school. ‘I can do more,’ said he to the Archbishop of Canterbury, taking a half-crown out of his pocket, ‘I can do more with this half-crown than you can do with all your fixed salaries.’”

His treatment of Mr. Bamford shows how well he understood the art of managing men for selfish ends, and how unscrupulously he practised it:—

“In his treatment of me,” says that gentleman, “he exercised that mixture of severity and apparent good-will which, however at times unpleasant to my feelings, had so much influence over me, that I adhered to him most exclusively; and as he impressed upon me, looked upon all others who spoke kindly to me, or wished me to seek some relaxation, as insidious enemies. He professed to have no other object in view but my good; and by opening mysteriously to me the power of future patronage with the necessity of implicit reliance, I was encouraged to expect a reward proportionate to any exertions I should make, however laborious or supererogatory. To him, therefore, I devoted myself. He found me docile, tractable, affectionate, and without guile or suspicion. He wished to train me up in that exclusive attachment to him and his pursuits, which rendered me a useful and necessary instrument for his present purposes, and which would prepare me for any future operations. He, therefore, exacted of me the prostration of the intellect, the affections, and the actions. All were to be at his disposal. Private views, and opinions, and friends, were to be discarded; and with a pure admiration and dependence, I yielded myself solely and wholly to his will. Severe and hard to endure was this course of discipline. He soon found that with the more gentle qualities of my nature, there were also united a warmth and impetuosity of temper, with a pride of spirit, which could be with pleasure led by gentleness, but which was fretted and wounded by harshness. But what could the vain ebullitions of youth avail against the cool and practised aims of age! By raising expectations without directly promising—by manifesting a parental care for my welfare, by professing sincere regard, by holding up inducements and future advancement, by candidly and honestly telling me my faults, by an air of the strictest justice, by enforcing unequivocal veracity, and every moral virtue, with a rigid industry, he bent and warped my mind to such a degree, that all my powers, and thoughts, and sentiments, were employed exclusively to please him, and fulfil his directions. I viewed nothing in the world but through the speculum he presented. Of himself he gave me a picture which I loved. He represented himself as delighted with truth, a lover of candor, the patron of merit; and he signalized me out as his little Lake boy, his protégée, nay, as his son, whom he regarded and trained up as his own. This, notwithstanding the many bitter moments of discipline which were used to try me, could not but gain upon such a heart as mine, particularly so inexperienced a one.”

He never appears to have lived happily with his wife, and in June, 1812, a regular deed of separation was drawn up and finally executed. He nowhere exhibits *amability* of character. Few, if any, loved him.

His vanity was prodigious: sometimes it is hateful, sometimes amusing. Mr. Davies, his amanuensis, whom he would keep employed for months together almost night and day, apparently regardless of his health or comfort, having on one occasion written to him an account of the progress he was making in the wearisome task assigned him of compiling from an immense mass of papers a complete edition of all the doctor's works, receives the following consolation:—“Go on. *You must be well aware how instructive, how exceedingly instructive* your present task is to you, and must still further be when I come to criticise and correct all you shall do.” Davies writes that he is at work

from six in the morning till ten at night; to which the doctor replies: "You must work, not as I have done, for that I do not expect, but as you can. *Your labors in no other way can be so profitable to the world, or so improving to yourself.*"

Mr. Bamford's account is equally ludicrous.

"He triumphantly displayed the mighty advantages with which I was favored in being allowed to copy and transcribe, from little scraps of paper and backs of letters, the chaotic effusions of his ardent mind. 'This was real training, far better than being at the university; and nobody knew where it might end, or what you may come to, if you give yourself up to this thing.' He would remark, after he tried my fidelity—'Now you know all my concerns; other people require oaths of secrecy; no man engages a common clerk, without having security for his faithfulness; but here I allow you to see my papers, and trust only to your honor. Though I do not ask you to swear, yet I expect that you will consider yourself as fully bound, as if you were sworn to secrecy.'"

In this respect alone—the attaching of vast importance to supposed discoveries in education—Lancaster resembled him. *He, too, had his "mysteries," known only to the initiated. He, too, was a moral spectacle, and a wonder to himself. If Bell "wielded one of the most stupendous engines" known "since the days of our Saviour and his apostles," Lancaster was not a whit behind in celebrity. He could instruct "a thousand children at the same time out of one book;"—his "youngest pupil could teach arithmetic with the certainty of a mathematician without knowing anything about it himself," and by these "wonderful inventions" the world was to be regenerated. If Bell "attached an overweening importance to trifles, and insisted with vehemence on all his notions being adopted," Lancaster (we were about to say) outdid him—but that was impossible—in this species of extravagance. Yet his boasted methods of punishment were radically bad, and have long since been abandoned as degrading and mischievous; and his system of rewards, including "badges of merit," "orders" of merit, chains, medals, and expensive prizes—scarcely less objectionable, have shared the same fate. Time has already set its seal upon the doings of both these men, and judgment has long since gone forth. But how different is the verdict to that which they so fondly anticipated. On all the *peculiarities* in which they gloried, men already pour contempt. The *monitorial* principle survives; but the trappings with which they encumbered it have long since proved worthless. Their pride is in the dust; their ambition, a vain show. Posterity will remember them rather as party leaders than as inventors or philanthropists, and succeeding generations will honor their zeal, their energy, and their perseverance under difficulties, rather than their wisdom, their genius, or their modesty.*

The *diversities* of character in the two men were many and striking. Lancaster, through his whole course, is the religious enthusiast; Bell, from youth to age, is distinguished by worldly-minded prudence. While the one is burning with desire to teach the blacks to read the Bible; the other is quietly earning a reputation for sobriety and circumspection. When Lancaster is "frequenting the meetings of Friends, and sacrificing worldly prospects to obtain inward peace," Bell is fighting a duel, and preparing to take orders in the church. While the unworldly Quaker is exclaim-

ing, "I don't want a stock of money, I only want a stock of faith;" the "disinterested" churchman is insatiate in his lust after place and preferment. While the one, generous to a fault and benevolent to a weakness, is complaining that his "soul succumbs under the burden when he sees hearts breaking under distress" and he "cannot or dare not help them;" the other, careful, and a little covetous withal, is pinching the "brethren," and bringing upon himself a visitation from the bishop. Both are proud; but with this difference—Lancaster is arrogant, Bell, vain. Both are self-worshippers, "the eye" of each is "ever on himself," but the result is not the same: in the one, self-complacency *destroys love*; in the other, it produces something like insanity. Under its influence, Lancaster, always generous and fervid, becomes habitually wasteful and flighty; Bell, with a natural tendency to be hard and grasping, becomes as habitually selfish and morose—"of the earth, and earthy."

In contemplating Dr. Bell as a beneficed clergyman, the mind is painfully affected in discovering no evidence whatever of spirituality of heart. He is always "high and dry." He has evidently more faith in natural philosophy, than in the gospel as a means of evangelizing India. Principal M'Cormick writes expressing distrust of the "well-meaning but ill-judging patrons of plans for the conversion of Gentoos, and ridicules the idea of attempting to teach Christianity to the natives of Bengal by "preaching its doctrines *slap-dash*;" and faithless Dr. Bell, instead of rebuking his skepticism, replies, that without the power of working miracles "*none can ever throw down the barriers which enclose their sacred shrines, or gain any converts whom a rational divine or pious Christian, who sets any value on a good life, would not blush to own.*"

His theology, too, is more than questionable. He understands by our Saviour's declaration, that we must become "little children" in order to "enter the kingdom of heaven," that, "among children, and from them, and by becoming as one of them, we are to learn those simple doctrines of nature and truth, *innate in them*, or which readily occur to their minds, as yet unbiassed by authority, prejudice, or custom." And he calls this the "school of nature and truth pointed out by the Son of God." We are by no means disposed to make any man an offender for a word, but we cannot help observing, that if Lancaster had expressed himself so incautiously, the friends of Dr. Bell would have eagerly seized upon the passage as conclusive evidence of a socialized mind.

Lancaster had his theological heresies, but they are of a totally different complexion. *His* perversions of scripture are all mystical, and it is curious to observe how they blend with his burning temperament. He is an "Elijah," a "chosen vessel," a David before Goliath—a Joshua before Jericho. Imaginative and excitable, he is *always* on fire; Bell, very rarely, except when defending "his system." The former often manifests heat without light; but the latter, as a Christian, never warms—all is cold as death. Coleridge, in one of his letters to Bell, unconsciously reads his friend a lesson when he observes, "A man who has nothing better than prudence is fit for no world to come;" he might have had poor Lancaster in his eye when he added, "and he who does not possess it in full activity is as unfit for the present world." Both might have profited by his conclusion. "What then shall we say? Have

both prudence and the moral sense, but subordinate the former to the latter; and so possess the flexibility and address of the serpent, to glide through the brakes and jungles of this life, with the wings of a dove to carry us upward to a better."

Lancaster's lack of prudence was happily supplied by a little band of men, now all gone to their reward, who, at great personal sacrifice, nobly came forward in the hour of need, and saved the schools he had established from utter and irremediable ruin. On two or three of these departed worthies we must bestow a passing notice.

William Corston, the simple-minded author of the "Brief Sketch," to which we have been so largely indebted, was once well known as the party who introduced into this country the manufacture of British Leghorn. Having shown that instead of being imported as heretofore from Italy and France, it might be manufactured by our own poor, he opened a warehouse for its sale on Ludgate Hill. The discovery attracted much notice. The "Society of Arts" pronounced the invention a national benefit, and rewarded the inventor with a gold medal. The "Society for bettering the Condition of the Poor" also noticed this valuable branch of manufacture in their reports. After many vicissitudes, some of which obliged him more than once to compound with his creditors, he eventually succeeded in his undertaking, and after a long and laborious life, retired on a small property to his native village of Fincham in Norfolk, where, at a very early period of his career he had established a school for poor children. It is due to this good and honorable man to state, that after emerging from pecuniary difficulties he called his creditors together, and with rare probity paid every debt in full.

William Corston was a Moravian by religious profession, a man of tender spirit and of warm affections. We have often heard him relate with brimming eyes the circumstance which first led him to take so deep an interest in the education of poor children. "I was going," he used to say, "when I was about twenty years of age, through Butt Lane, Deptford, when I heard voices singing, and looking up, saw a board on which was inscribed, 'To the glory of God and the benefit of poor children. This school was erected by Dean Stanhope.' I stood looking and musing upon it, when the voices of the children so affected me that tears flowed down my cheeks, and the prayer immediately arose in my heart, O! that it may please God that I may have it in my power one day to build a school like this for poor children!"* He accomplished his object, and the school still stands, bearing the same inscription—"To the glory of God and the benefit of poor children."

Lancaster never had a more attached friend than this good Samaritan. In all his trials we find him pouring his sorrows into the sympathizing bosom of the man whom he delights to call his "friend," his "fellow-laborer," his "brother," his "best beloved and faithful one"—and he never appeals in vain. In later years, Mr. Corston spent most of his time at Fincham, where he died on the 25th of May, 1843, in the 84th year of his age.

Joseph Fox, to whom Lancaster was introduced in 1807, was a medical man, not less eminent for

his professional skill, than for his extensive and diversified benevolence. He was, like Corston, a man of quick feelings and of sensitive nature. In religious sentiment he was either an independent or a baptist, we are not sure which. Fox, while at Dover, was taken by the late Sir John Jackson, with whom he was residing, to hear Lancaster lecture, and such was the effect produced upon him by the fervid oratory of the speaker, that at the conclusion of the lecture he rose, and with the greatest emotion and solemnity exclaimed, "Were I to hold my peace, after what I have now heard and experienced, the stones might cry out against me." His heart and hand were from this moment truly devoted to the work.

On his return to London, it was agreed that he should meet Lancaster to dinner at Ludgate Hill, and Mr. Corston thus describes the interview.

"After dinner, our first subject was the debt. 'Well, Joseph,' said Mr. Fox, 'what do you owe now? Do you owe a thousand pounds?' He only replied, 'Yes!' After a little time, he asked, 'Do you owe two thousand pounds?' A significant pause ensued. Joseph again replied, 'Yes.' The third time he inquired, with increased earnestness, affectionately tapping him on the shoulder, 'Do you owe three thousand pounds?' Joseph burst into tears. 'You must ask William Corston,' said he. 'He knows better what I owe, than I do myself.' Mr. Fox then rising from his seat, and addressing me solemnly, said, 'Sir, I am come to London to see the devil in his worst shape; tell me what he owes.' 'Why, sir,' I replied, 'it is nearer four thousand than three.' He returned to his chair, and seemed for some time to be absorbed in prayer—not a word passed from either of us. Mr. Fox at length rose, and addressed me, said, 'Sir, I can do it with your assistance.' I replied, 'I know, sir, that God has sent you to help us; and all that I can do is at your command.' He rejoined, 'I can only at present, lay my hand upon two thousand pounds. Will you accept all the bills I draw upon you? and every one shall have twenty shillings in the pound, and interest if they require it.' I replied, 'I will.' We then all instantly rose, and embraced each other like children, shedding tears of affection and joy. 'The cause is saved!' exclaimed Mr. Fox. I replied, 'Yes; and a three-fold cord is not easily broke.' Thus, through the gracious and almighty hand of Him, who prospers his own cause, and makes it to triumph over all its enemies and obstacles; thus was the foundation laid for the maintenance of an institution, which was destined to confer the blessing of Christian education upon millions and millions of mankind.

"We immediately, and with renewed energy, proceeded with the work. Two days after, the bills, forty-four in number, were drawn, accepted, and given to the creditors; and, with gratitude to the Divine goodness, it may be added, that they were all honored as they became due.

"Soon after this, we were joined by several valuable friends, and on March 1, 1808, a committee was formed, consisting of the following persons:—

"(Their names are given in the order in which they engaged in the work.)

THOMAS STURGE,	WILLIAM ALLEN,
WILLIAM CORSTON,	JOHN JACKSON,
JOSEPH FOX,	JOSEPH FOSTER.

* By some unaccountable mistake Mr. Southey has attributed this incident to Lancaster, and made him the straw-plait manufacturer.

"From this time the accounts were properly kept, the trustees holding themselves responsible to the public. Nevertheless, they were further called upon to advance large sums, from time to time; and for nine years, cheerfully sustained the burden of a debt of £8000.

"At length, Mr. Whitbread, who attended the committee, observed that it was a *shame* that a benevolent public should let six gentlemen be so far in advance for so long a time; and proposed that a hundred friends should be sought for, who would undertake to subscribe or collect £100 each for the work. In three years this plan proved successful, and in that time was raised £11,040, by which a new school was built, and the establishment greatly enlarged. And in the year 1817 the trustees were exonerated."—pp. 54—57.

Mr. Fox devoted himself with characteristic energy to the work he had undertaken, and on the formation of the British and Foreign School Society in 1808, he became its secretary; an office which he rendered honorable by his gratuitous but unceasing and unabated labors. He died on the 11th of April, 1816, at the early age of forty years.

The last survivor of this little band was William Allen, whose recent departure in a good old age, has been noticed in most of the leading periodicals of the day. A few words regarding this venerable philanthropist, must complete the hasty and imperfect sketches on which we have, perhaps, too rashly ventured.

William Allen, at the period to which we have been referring, was a chemist, carrying on an extensive and lucrative business in Plough Court, Lombard street, and at the same time delivering a course of lectures at the Royal Institution. Here he had formed friendships with Sir Humphrey Davy and other eminent persons, which ended only with their lives.

In the year 1805 he visited Lancaster's school in the Borough Road for the first time. He was much struck by what he witnessed—became a subscriber to the school, and availed himself of every opportunity for drawing attention to its merits. In 1808 he joined Lancaster's other friends in undertaking the responsibility of his debts, and was for upwards of five and thirty years treasurer to the institution which arose out of his movements.

His life was eminently active and useful. In the year 1818, being then a minister among the society of Friends, he visited Norway, and from thence proceeded through Stockholm and Finland to St. Petersburg. Here, in conjunction with two other friends, he compiled the excellent volume of Scripture selections which, in connection with the entire Scriptures, has ever since been used in the schools of the society. This volume was immediately translated and printed in Russia for the use of the schools in that great empire.

After leaving Petersburg, he proceeded through some of the large towns of Russia to the German colonies on the banks of the Dnieper; and thence to Constantinople, Smyrna, Greece, and the Ionian Islands. After a detention at Zante in consequence of serious and protracted illness, he returned home through Italy, Switzerland, and France. In 1822, he again visited the continent of Europe, and at Vienna and Verona among the ministers of the different courts of Europe then assembled, proclaimed the iniquities of the African slave trade, and pleaded the cause of the oppressed

Greeks, and of the persecuted Waldenses of Piedmont. For the former he obtained some important privileges, and for the latter he secured increased liberty of conscience.

At home he was well known as an ardent and untiring philanthropist;—in character, unspotted—in charity, abundant—in manners, a courtier—in purity of life, a saint. His latter years were chiefly passed at Lindfield, in Sussex, where he had established schools of industry, and here he died on the 30th of December, 1843, in the seventy-third year of his age. His last thoughts were on the love of Christ and on the true unity of a redeemed people; his mind dwelling with lingering affection on the words of Jesus, "that they may be with me where I am." "I in them, and thou in me, that they all may be one in us." In the near approach of dissolution a heavenly serenity settled on his countenance: his hands were raised in the attitude of prayer, and then tranquilly rested on his bosom, as the redeemed spirit was gently released from its earthly tenement.

Should his life ever be written—and it would be an instructive one—the great lesson to be gathered from it would be, the practicability of combining through a long life, the obligations of trade, the pursuits of science, the enjoyments of philanthropy, and the duties of a gospel ministry. We can conceive of nothing better calculated to correct early and ill-directed ambition, to check youthful pride, or to cure unreasonable disgusts, than the observation of so healthful an example, as that of a man whose varied honors were but successive developments of growing character, each appearing in its appropriate season, and each bringing with it its suitable reward.

Of the remaining three early friends of Lancaster, only one was known to the writer of this article—Joseph Foster, an upright and honorable man—generous, hospitable, sincere, incapable of meanness, and indignant at wrong. He too has gone to his rest, the only one who has left his name and place in the society occupied by a son.

Of the *political* founders of the institution few now remain. The Dukes of Kent and Sussex, the Duke of Bedford and Lord Somerville, Mr. Whitbread, Sir Samuel Romilly, Mr. Horner, Sir James Macintosh, and many others who might be named, are all gone. And Rowland Hill, whose cheerful voice used so often to ring through the committee room, as he led in his retiring but noble-hearted friend John Bradley Wilson, who usually accompanied him from his Friday morning service; and Wilberforce, in a somewhat equivocal position, as an annual subscriber, a vice-president, an eloquent advocate, and yet, according to his sons, a disapprover of the society; and humbler names, a sacramental host, who did good service to the cause in their day and generation, have gone too, leaving the principles they espoused, and the society they established, to be defended, sustained, and preserved for succeeding generations by those who cherish their memory, and occupy their places.

Poor Lancaster, who had often occasion to join with the Psalmist and pray—"Deliver my soul, O Lord, from *lying* lips, and a *deceitful* tongue," being charged with Deism, once published his "belief," and if words have any meaning, it is abundantly satisfactory. We quote it as a curious

and almost solitary instance of Quaker theology thrown into the form of a *crede*. "I am," he says, "a firm believer in the divinity of Jesus Christ. I believe that the Holy Scriptures were given by inspiration, and contain in writing the revealed will of God. I believe the doctrine of the fall of man, and the alienation from God consequent on that fall. I believe that there are three that bear record in heaven; the FATHER, the WORD, and the SPIRIT, and that these three are one. I believe in the doctrine of justification by faith in Jesus Christ. I know that salvation can only be obtained by the name of Christ, and by the oblation of himself which he made on the cross. I believe THE APOSTLES' CREED to be a just inference from the Scriptures, at once excellent, simple, and expressive; but it was not given in its present collective form by inspiration, as the writings of the apostles were; and who can blame me for preferring, as an individual, the inspired writings of the apostle, which contain the substance of the creed in almost every page, and often in a few lines, to any inference therefrom by men, however excellent in their kind? Can such inferences rival the beautiful language of St. John, or the majestic yet simple eloquence of St. Paul?" SOCINIAN, DEIST, INFIDEL! May thy sound faith, and loving heart, inspire us with a large charity for thy many faults and grievous wanderings!

From *Ainsworth's Magazine*.

THE LATE MR. LAMAN BLANCHARD.

"I am distressed for thee, my brother Jonathan: very pleasant hast thou been unto me." 2 Sam., Chap. i.

It is with feelings of the deepest sadness, which the consciousness of the world's appreciation of his worth can scarcely mitigate, that we find ourselves called upon to speak of one who occupied so honorable and conspicuous a place in periodical literature as the late Mr. Laman Blanchard; but, however reluctant to dwell upon the painful theme, his direct association with our own labors demands that we should devote some portion of our space to his memory.

Were we to give full license to the grief which we share in common with many who valued him, our efforts to record our sense of his loss would prove completely unavailing, and ours would be—

"The voiceless thought which would not speak,
but weep."

But the desire, imperfect as the attempt may be, to do justice to his literary fame, masters all other considerations and compels our attention to the claims of his genius upon the notice of the world, while yet the tears of sorrow for his untimely fate flow freshly from their source; for though, in his lamented death—

"The flash of wit, the bright intelligence,
The beam of song, the blaze of eloquence,
Set with their sun, they still have left behind
The enduring produce of immortal mind;
Fruits of a genial morn and glorious noon—
A deathless part of him who died too soon."

Laman Blanchard's abilities were as various as they were striking. His ever active mind, teeming with fine thoughts and sparkling fancies, needed but a word to guide it in the required direction; the slightest suggestion was at once seized and made palpable in the clearest and most

intelligible language. It was the possession of this faculty that made his services as a political writer so valuable, while the brilliancy and originality of his conceptions developed the poet, the wit, and the moralist. It is not within our province to examine his productions in the former capacity; there remain of his works fortunately more than enough to assist our more legitimate inquiry.

In earlier years Laman Blanchard cherished the hope of being known to fame chiefly as a poet; poetry was his "young affection," and had not the necessities of this "hard work-a-day world" tied him down to its stern realities, he might, even in these prosaic days, have achieved his object. As it was, he never ceased, when opportunity offered, to "strictly meditate the thankless muse," and gave out, from time to time, verses of exquisite tenderness, taste, and feeling, enough for a reputation, though insufficient to satisfy the deep yearnings of the poet's own heart. We have not all the means before us that we could desire to furnish proof of his poetical powers, for, with the exception of one small volume, published several years since, there is not at present any collection of all he so freely scattered. Enough, however, exists in the pages of our own Magazine, to which, from its foundation till his death, he was one of the leading contributors, to justify the assertion that he deserved no mean place amongst those who "build the lofty rhyme," though his name may descend to posterity on other and more assured grounds.

Deeply reverent as are now the countless worshippers of Shakspeare, there breathed not one perhaps, who worshipped the bard with a more ardent and purer feeling than Laman Blanchard, in proof of which let these lines testify, which were written—On the first page of a volume intended for the reception of essays and drawings illustrative of Shakspeare."

"Like one who stands
On the bright verge of some enchanted shore,
Where notes from airy harps, and hidden hands,
Are, from the green grass and the golden sands,
Far echoed, o'er and o'er,
As if the trance'd listener to invite
Into that world of light.

Thus stood I here,
Musing awhile on these unblotted leaves,
Till the blank pages brighten'd, and mine ear
Found music in their rustling, sweet and clear,
And wreathes that fancy weaves
Entwined the volume—fill'd with grateful lays,
And songs of rapturous praise.

No sound I heard,
But echoed o'er and o'er our Shakspeare's name,
One lingering note of love, link'd word to word,
Till every leaf was as a fairy bird,
Whose song is still the same;
Or each was as a flower, with folded cells
For Pucks and Ariels!

And visions grew—
Visions not brief, though bright, which frosted age
Hath fail'd to rob of one diviner hue,
Making them more familiar, yet more new—
These flash'd into the page;
A group of crown'd things—the radiant themes
Of Shakspeare's Avon dreams!

Of crownèd things—
 (Rare crowns of living gems and lasting flowers)
 Some in the human likeness, some with wings—
 Dyed in the beauty of ethereal springs—
 Some shedding piteous showers
 Of natural tears, and some in smiles that fell
 Like sunshine on a dell.

Here Art had caught
 The perfect mould of Hamlet's princely form,—
 The frantic Thane, fiend-cheated, lived, me-
 thought;
 Here Timon howl'd; anon, sublimely wrought,
 Stood Lear amid the storm;
 There Romeo droop'd, or soared—while Jacques,
 here,
 Still watch'd the weeping deer

And then a throng
 Of heavenly natures, clad in earthly vest,
 Like angel-apparitions, pass'd along;
 The rich-lipp'd Rosalind, all light and song,
 And Imogen's white breast;
 Low-voiced Cordelia, with her stifled sighs,
 And Juliet's shrouded eyes.

The page, turn'd o'er,
 Show'd Kate—or Viola—my Lady Tongue—
 The lost Venetian, with her living Moor;
 The Maiden-Wonder on the haunted shore,
 Happy, and fair, and young;
 Till on a poor, love-martyr'd mind I look—
 Ophelia, at the brook.

With sweet Anne Page
 The bright throng ended; for, untouch'd by time,
 Came Falstaff, laughter-laurell'd, young in age,
 With many a ripe and sack-devoted sage!
 And deathless clowns sublime,
 Crowded the leaf, to vanish at a swoop,
 Like Oberon and his troop.

Here sate, entranced,
 Malvolio, leg-trapp'd;—he who served the Jew
 Still with the fiend seem'd running;—then advanced
 Messina's pretty piece of flesh, and danced
 With Bottom and his crew;—
 Mercutio, Benedick, press'd points of wit,
 And Osrick made his hit.

At these, ere long,
 Awoke my laughter, and the spell was past;
 Of the gay multitude, a marvellous throng,
 No trace is here—no tints, no word, no song,
 On these bare leaves are cast—
 The altar has been rear'd, an offering fit—
 The flame is still unlit.

Oh! who now bent
 In humble reverence, hopes one wreath to bind
 Worthy of him, whose genius, strangely blent,
 Could kindle 'wonder and astonishment'
 In Milton's starry mind!
 Who stood alone, but not as one apart,
 And saw man's inmost heart!"

By the readers of this Magazine, such lyrics as
 "The Tour of Love and Time," "Science and
 Good Humor," and that beautiful song on "The
 Old Green Lane," are, doubtless, "freshly re-
 membered;" still less can they have forgotten
 that exquisite monody, "The Eloquent Pastor
 Dead," which contains so much that now, alas!
 is applicable to the writer, that we cannot refuse
 to quote a few of the most touching stanzas:—

"Lament not for the vanish'd! Earth to him
 Is now a fluttering star, far off, and dim,
 And Life a spectre, volatile and grim.

Weep not, ye mourners, for the great one lost!
 Rich sunshine lies beyond this night of frost—
 Our troubles are not worth the tears they cost.

Give forth the song of love, the steadfast vow—
 No tear! for Death and He are parted now,
 And Life sits throned on his conscious brow.

Oh, mourn not! yet remember what has been—
 How buoyantly he trod this troubled scene,
 The pathways of his spirit always green!

He taught the cheerfulness that still is ours,
 The sweetness that still lurks in human powers;—
 If heaven be full of stars, the earth has flowers!

His was the searching thought, the glowing mind;
 The gentle will to others' soon resign'd;
 But more than all, the feeling just and kind.

His pleasures were as melodies from reeds—
 Sweet books, deep music, and unselfish deeds,
 Finding immortal flowers in human weeds.

His thoughts were as a pyramid up-piled,
 On whose far top an angel stood and smiled—
 Yet, in his heart, was he a simple child."

How much of this description was true in Laman
 Blanchard, let those who knew and loved him
 declare. For ourselves, we can answer for the
 application of every line. In his heart, he was,
 in truth, "a simple child."

But whatever his poetical merits, it is as an
 essayist that he will hereafter be known to the
 world; and it was, no doubt, the secret conscious-
 ness of success in this department of literature that
 prompted him, during the last few years of his life,
 to marshal his thoughts principally in that shape.

Month after month did he continue to pour forth
 themes sparkling with wit, profound with wisdom
 and truth; a shrewd observer of human nature,
 but ever noting the follies and frailties of man-
 kind with a lenient eye, he spared while he cor-
 rected, and excited a kindly admiration while he
 censured. Good humor and benevolence, no less
 than integrity of purpose, distinguished all he
 wrote; and though earnest and impassioned in
 the reprehension of vice or meanness, he never
 satirized with bitterness. Of quick discernment,
 and endowed with a nice appreciation of character,
 he exposed the foibles of man and the errors of
 society without the slightest tinge of personal feel-
 ing; and cheerfulness, amid all his trials—and
 they were neither few nor light—so filled his heart
 that it shed its glow over everything he touched.

To this Magazine he contributed many of his
 essays; but the bulk of them, which, we are happy
 to hear, will shortly be published in a collected
 form, were contributed to the "New Monthly
 Magazine." It is from these that we prefer mak-
 ing the extracts that justify our opinion of his
 peculiar abilities, and place him on a level with
 one whom he admired and knew well—the cele-
 brated Elia.

Observe to what conclusions the consideration of
 that hackneyed subterfuge, the phrase of "Faults
 on both sides," led him:

"Yet how are sacred things profaned, and the
 sweetest uses of poetry perverted, to the lowest

and falsest ends! This very phrase, which seems to hold, in the narrowest compass, the moral of all life, and to convey the verdict agreed upon by Truth the plain speaker, and Philosophy the oracle, in relation to all the vain and aggravated contentions of mankind,—this phrase is made a catch-word, a slang saying, a jest, becoming in the very meanest mouths, and fitted for the vilest objects.

"There is no form of words which has worked more mischief in the social world, as far as words alone can work it, than this simple phrase. It is caught up from lip to lip—repeated until sense is lost in mere sound; and the general truth becomes a particular falsehood in thousands of instances. Its real meaning is struck out, and a hollow lie is substituted. Where we should find the white, sweet kernel, the maggot fattens. 'Faults on both sides,' is the language, not of the philosopher, the moralist, the peace-making, pardoning Christian—but of the self-elected juror, the concealed and cowardly slanderer, the heartless and abandoned leveller, who would confound vice and virtue, and merge all distinctions, not merely of guilt, but of guilt and innocence, in a loose, easy, general, comfortable verdict—a safe one universally—'faults on both sides.'

"You are not far from the truth there," is the cry of the sage babblers of society as often as the verdict is delivered—not very, in one sense, but awfully near a lie, dark and silent as assassination, perhaps, in another sense. A reputation is possibly sacrificed in the very utterance of the words—a life's life may be destroyed—a great cause, sacred as virtue, is given up at once—the broadest, simplest points of difference are confused and merged uninquiringly—and honor and shame reduced to the same measure, color, and substance; all by the easy, current verdict, applicable to the most difficult and the most contradictory cases—'there are faults on both sides.'

"The Father of Evil never invented a more dexterous weapon for his agents to work with. The evened-out point is so concealed, while it looks so open and fair. Candor so shines in it, that inquiry is subdued at once. Remonstrance is silenced by a text so impartial. Once utter this decree, and there is no more to be said. 'There are faults on both sides,' generally settles all to everybody's satisfaction.

"The lovers of peace are satisfied, for it cuts short the dispute. The sympathizers with virtue submit, for it spares her the dangerous intoxication of a triumph. The allies of the vicious are comforted, for their client is lifted up in repute to the virtuous level. The slanderers exult, because it gives them a cue for reviling both parties. The timid, selfish people are reconciled, for they are relieved from the risk of taking part one way or the other. The indolent are saved the trouble of investigating. The hypocrites admit that there may possibly be a fault or so more on one side than on the other, but protest vehemently against the practice of balancing hairs and reopening cases that are finally settled. The verdict is given: there is no new trial to be had when once human nature has heard the decree pronounced—'There are faults on both sides.'"

The special application of this view of the subject is beautifully made in the story of "Lyddie Erie," much of which is, unhappily, drawn from nature.

In the same paper we find the following humorous but truthful remarks on "Trial by Jury:"

"Certain it is, that at this instant, in the honest city we reside in, juries are, to say the least, as unpopular as in Botany Bay. We, who have unsullied characters, who abjure every vice that is unlawful, and who live in the practice of every virtue that is agreeable to our constitutions, all under the protection of the jury-box, rail as loudly at juries, as the rascals of whom juries rid us.

"But then, how nicely we discriminate—with what a fine and delicate hand we draw the line between (as we may say) the box and its twelve tenants. How philosophically we distinguish between the jury and the juryism, between the practice and the principle. While we bully the 'honest and intelligent' dozen, as often as we please, how rapturously we, on every occasion, extol the system. The blockheads assembled in the box are only not knaves and perjurers, because they are dense fools, or dreamers past waking; but the box itself is all the while religiously held to be a blessing invaluable."

"An Englishman may just as well poison his grandmother, as rail at trials by jury. No false indictment was ever torn to pieces in the face of the world, under a jury's unerring and beneficent auspices, as that freeborn Briton would be who should dare to whisper in any popular assembly a syllable disparaging to that glorious institution."

"But the jurymen are all forsworn—the whole defenceless twelve. They alone are without shield or protection; for them, no man, however chivalrous his nature, feels called upon to stand up. It is nobody's business to see a jury righted; at best, the verdict in their case would be 'justifiable ill-usage.'"

"They are called 'honest and intelligent' by courtesy, but the words mean no more than 'honorable' before 'member.' If they follow the judge's dictation, they are handsomely pronounced to be 'servile, spiritless, and forsworn;' if they happen to differ with that learned person, and bring in a verdict contrary to his intelligible direction, they are pretty sure to be self-willed, prejudiced, ignorant, and reckless of law and evidence. If they come to a decision instantaneously, the decision, though right, is farcical for want of deliberation; if they have conscientious scruples and cannot agree, we lock them up and starve them into unanimity; thus obtaining a verdict, not by the strength of their understandings and the purity of their consciences, but by physical torture and the exhaustion of their animal powers. In a question of life and death, we force a decree, ay or no, not from the brain, but from the stomach."

"People who always keep their word" afford him a theme for much clever argument and happy illustration:

"The people who always keep their word, if you will take their word for the fact, are to be met with in immense varieties. To portray them is to paint Legion. It is also to unite opposites under one head; for those who always keep their word are not to be known, sometimes, from those who never do."

Here is a well-drawn character, Nick Froth:

"In whatever water you may happen to be, there he is upon the surface floating buoyantly within hail, and anxious to play the friend in any emergency. But just as you are sinking, he lets go your hand, and swims off in search of the life-buoy, promising to return with speed. He enters eagerly into an engagement to get you out of hot water, and when the element has had plenty of time to

cool, there he is at his post, ready to redeem his promise."

A variety of this class :

"Men of their word, with a reservation—conscience all over, when convenience is in the way."

"Very honest people as long as the sun shines and honesty can make hay. In the cold season, with nothing to do, they may be apt to thrust their hands into somebody's pocket—to keep them warm. They make the promise first and then bethink themselves what possibility there is of its fulfilment. They are often as good as their word—but then, their word is good for nothing."

"But although all these people, the majority of the promising crowds who are about one everywhere, regard themselves as persons of their word, and are so to this extent—that they rarely perhaps break a serious promise without some little shabby show of an excuse for doing so; it is to be understood that the very best of them reserve points to themselves on which they may break faith when they like—points on which no expectation of their fidelity is to be reasonably expected."

The following is wittily put :

"It must be plain that even among persons who always keep their word, there are differences of position and circumstance by which we are all moved to cherish preferences and prejudices, affecting our belief in their faithfulness. When a judge promises to hang a man, we are more apt to put faith in him than in a physician when he promises to cure one—yet both, perhaps, in themselves are equally worthy of trust. Of two promises made by the very worthiest of our acquaintances—first, that he will come and dine with us, and, secondly, that he will call and pay the balance, we cannot, with the best of feelings, help relying more on one assertion than the other."

Those who are really sincere in all they promise are thus characterized :—

"Persons who always keep their word recognize in it more and more a sacredness beyond the letter of it, and are the first to feel that they are sometimes bound by a solemn contract, even when they have uttered no syllable in sanction of it. *More promises are made than ever can be spoken: an angel even in our company makes them for us.*"

In the last thought the poet shines out. In his illustrations of the *tedium vite*, he truly says :

"Nothing is liable to such continual and extraordinary variation as time, the present hour differing so from the next that the minutes of one may be as years in the other—nay, as a vast eternity, ever dying and yet endless. Our lamentations over the shortness of life might be spared when we reflect upon the many long days that fall to the lot of every creature in his turn, though there is little perhaps of liveliness in the thought that all those long days are emphatically and necessarily the dull ones of our year, and that this very dullness regulates the degrees of their duration. Nor is it of much avail to seek comfort by counting up the happier days that have intervened, for these are always found to be the shortest in the calendar."

The following, on the same subject, is a touching picture :

"The long, dull, weary day of factory labor—restless, vigilant, and incessant—gathers, nevertheless, with a less grievous weight, hour by hour, upon the overtaxed heart than would the slow and lengthening minutes of the morrow, if on that sunless day the father saw his children spared from

grinding toil, pining with hunger. The day devoted to watchful tending by the bed of pain, when the being we most deeply revere is helpless, prostrate, and in peril, wears out less darkly than the fixed and hopeless monotony of the after day, when such tending is needed no more. Short and merry is the long, sad time, from early morn to noon, from eve unto deep moonlight, passed on the becalmed sea by the impatient, heart-sick mariner, compared with that *one day*—that now long, marvellous lifetime, sweet, and yet most horrible to bear—when the sunrise sees him sole survivor of the wreck, and the sunset leaves him hanging to a wave-washed point, or floating on a spar alone, and in the dark, between sea and sky."

The absurdity of discovering "coincidences," on every occasion is agreeably satirized :

"To talk is not always necessary—to think is enough. 'How unlucky,' says Shiver, 'that I should have thought this morning of that wine bill, run up before I was married, after forgetting it for five years. The man will certainly send the account to-morrow, or perhaps call himself with it to-night.'"

This gentleman has a helpmate, who jumps at conclusions no less heartily than himself :

"One night, just before supper, she sprang across the room, singing as she went. 'Talking of *these things*, it always happens so. Here is my lovely friend, Mrs. Wix.' She then ran to embrace a very pretty little figure. 'These things' which had just been mentioned were game and poultry; and it turned out afterwards that Mrs. Wix was the daughter of a distinguished poulterer. That coincidence had flashed on the vigilant perception of Mrs. S."

Speaking of the institution of a particular society for various purposes, he prettily and quaintly says :

"How it originated is of little consequence. Be sure of this, that its origin was small enough; what good work ever had any other! There is no crevice so narrow that good will not ooze through it, and gather and augment slowly, until it can force its way by degrees, and flow into a broad, full stream. Once set good going, and who can say where it will stop!"

The change that takes place in men is well treated of in "Deceased People whom we meet daily."—[Copied into the *Living Age*, Vol. I., p. 222.]

These are his ideas on the potent disenchantment of the worldly-minded who live for society alone :

"Human nature, at home, then, is a true thing—a veritably honest existence. It is not a semblance of the man, but the man. He has scraped off his hypocrisy with the dirt from his shoes at the street door ere he entered; he has left his mask, comic or tragic, with his hat on the appointed peg, not wanting either by the fireside where he unfolds himself; and he has thrown off the garb of outward manner which he has perhaps all day worn, as effectually as he had relieved himself of his travelling incumbrances. He has now no more power to act a part than he would have in sleep. His face, is his natural face, his manner is his own personal property, and his speech is not a kind of ventriloquism, but describes his real feelings in tones unaffected. The sacredness associated with 'home' is, in plain English, (one of the dead languages) a convenient cloak for playing pranks in, securely and unobserved. When people find it a relief to leave off acting for

a few hours, they fly to the domesticities. At home they are behind the scenes, out of view, and at liberty to be themselves again. As at the twirl of a wand, off goes the finery; the finished gentlemen scowls, grimaces, kicks the cat, and curses the servants, with an exquisite relish of ease and freedom; the tragedy queen tosses off her pot of porter in comfort; the safe, grave man is a giddy vagabond; the dashing spendthrift, a sudden convert to penuriousness; the arbiter of all fashion, a seedy scarecrow; the advocate of temperance asks for a corkscrew; the saint swears he is tired of the devil; and the charming young lady sits down to sulk, and think spiteful things of that Miss Grigs, who was asked to dance eleven times to her nine."

Shakspeare has told us that "homekeeping youths have ever homely wits;" of such a class is Mrs. Fixbury, "the lover of home:"—

"Home, in her idea of it, means certain rooms, with suitable fixtures and furniture. That was all! Observe: she was ardently attached to her home! that is, in other words, she had a wonderful liking for her nice apartments. She had an exquisite sense of all that is most elevated and refined in domestic associations! that is, in other words, she had a tender regard for every inanimate thing belonging to her on which her daily household eye rested."

"Home never meant, in her clear, plain, domestic understanding—no, never meant husband, children, and friends—the cheerful meal, the social fireside, and the silent pillow; it only meant a collection of common-place conveniences and ornaments, sanctified and endeared by hourly use and habit. Now, if the reader, wandering and peeping about in the odd dark corners of the world, have not yet encountered a lady wrapped up in a fond regard for her own fire-irons and buffet, her harpsichord and window curtains, then he has missed what assuredly he would have known had he been born sooner and encountered Mrs. Fixbury."

The article "On considering oneself horse-whipped," is a happy application of imagination to the cure of positive evils.—[Living Age, Vol. III., p. 182.]

Hear how he characterizes that gift, of which all the world are so liberal:

"Advice gratis wears a remarkably unscrupulous aspect. He has a long tongue which hangs half out of his mouth, a long sight which detects the approach of a victim, before he has turned the corner, a long finger to twine round the button of a hapless listener, and a short memory, which causes him to recommend two opposite remedies to the same patient, both wrong ones."

But we might multiply examples without end, indicative of shrewdness of observation, felicity of thought, and justness of expression, as well as adduce illustrations numberless of orders and degrees of men: there are Jonas Fairbrow, the honest, straightforward man; the openhearted Mrs. Aspenall, the cautious Johnny Sint; Robert Amber, "the man who had a reputation for integrity;" John Screw, the hater of the rich; Mrs. Dipple, the female arithmetician—these and a hundred more rise at once to our recollection, a *dramatis persone* large enough to stock the entire realm of comedy. One more extract, and we have done; it is from the last thing he wrote in the "New Monthly Magazine," (December, 1844,) and is full of that wit and genial disposi-

tion which so eminently characterized him. Speaking of Christmas, the last, poor fellow! he was destined to see, he says:

"One of the charms of Christmas is the bounty it brings. It is an old constant distinguishing characteristic of the season to exhibit a soul too broad and embracing to be shut in by the narrow though equitable boundaries of commerce, too lavish to throw its heart's wealth into a scale, and weigh it out in scruples. It is no period for scant measures, or for bare justice; the cup must overflow. Who ever said at Christmas, 'But can't you take half a mince-pie?' The spirit of the time is ungrudging, hospitable, generous. It is not the meal of Enough, but the festival of Excess. At such a season the common law of debtor and creditor is repealed. It is all give and take. The simple rule is—

"That they should give who have the power,
And they should take who can."

Less than happy be his new year, who could carp and cavil at the large, free, bountiful, open-hearted, full-handed, gift-scattering philosophy of Christmas!"

But our limits, rather than our inclination or resources, warn us to pause.

It will be a lasting source of satisfaction to us, if in what we have adduced, we have succeeded in directing the attention of the public to the literary remains of Laman Blanchard. For ourselves, we can only say, with Shenstone—

"Heu! quanto minus est cum reliquis versari,
quam tui meminisse!"

From the Dublin University Magazine.

EARL OF ROSSE'S TELESCOPE—POSSIBLE DISCOVERIES.

THE public has been favored with many descriptions of Lord Rosse's magnificent telescope, and the successful arrangements by which he has been enabled to bring to perfection this splendid triumph of science and art; but it does not appear that any detail, however superficial, or prognostic, however fanciful, has yet touched upon the discoveries it may possibly effect, or the advances in human knowledge which may be expected, or at least desired, from its extraordinary powers. It may not be amiss to endeavor, in some degree, to supply this deficiency; and though the attempt may, in its execution, be stigmatized as fanciful and superficial, still it may act as a stimulus to others; and in the mean while gratify those who, satisfied with popular views, may take an interest in this deeply important subject.

1. In the first place, it may be expected, with certainty, that, in penetrating into still remoter regions of space, it will add considerably to the two thousand five hundred nebulae, numbered by Sir William Herschel in our hemisphere;* and that it will resolve into stars many of those which still remained luminous clouds in the most powerful telescopes of both the Herschels. In this well-informed age, it is well-nigh superfluous to observe that every nebula is, as it were, another universe, equal, or at least similar, to that which we behold in a starry night, when myriads of lu-

* See Sir William Herschel's papers on the Motion of the Sun and Solar System, in the Philosophical Transactions of the years 1793 and 1795.

minaries condense their light in the milky-way, or separately shed their rays upon us as they are nearer to our eyes. Yet all these splendors, so magnificent to us, would appear but a nebula to a spectator in one of those distant clusters of stars. Every nebula, therefore, which Lord Rosse's telescope adds to those already known, brings to light another universe, composed of millions of stars; every star a sun, attended by a system of planets, satellites, and comets, and contributing to the happiness of an infinitude of beings, capable of elevating their thoughts and feelings to the stupendous Creator of such a creation.

II. In the second place, this powerful instrument may afford a clearer insight into the nature of that filmy, luminous substance in the girdle of Andromeda, and other parts of the heavens which no telescopic power has yet sufficed to resolve into stars, and which some astronomers suppose to be the rudiments of future solar systems—universes in the progress of arrangement.* Yet it must be admitted that a more intimate knowledge of this substance, although possible, is still scarcely to be expected.

It may, however, be found that this substance, apparently a mass of nebulous light, may be composed of myriads of small meteoric bodies, at a considerable distance from each other, but condensed more or less to the eye, according to their relative remoteness from the earth; and that one of these nebulosities not only approaches, but actually crosses, the ecliptic, and traverses a portion of the space within the orbit of the earth; that the star-showers, as they are called, and which exhibit sixty or eighty of these star-like meteors in a single hour—four or five hundred in a single night—are occasioned by the passage of the earth through this nebosity thus crossing its orbit; and although these meteors may be comparatively in a state of rest, the rapid motion of our globe passing through the mass would give them the apparent velocity of shooting stars. Such bodies occasionally come in contact with the earth; and several of them, composed of iron, nichel, and other solid substances, have from time to time been found, and exercised the ingenuity of philosophers in devising whether they were ejected from some lunar volcano, have travelled at random through free space, or rolled in regular orbits round the sun, the earth, or the moon. Sir John Herschel, from the phenomena observed by him on the 10th of August, 1839, and the 9th of August, 1840, inferred that a zone or zones of these bodies turn round the sun, and are cut by the earth in its annual revolution.† This inference nearly coincides with the above hypothesis; but he does not touch the question whether this mass of meteoric bodies is or is not a nebosity similar to that in the girdle of Andromeda.

This latter conjecture is, perhaps, more near the truth than any of them. It, however, without being singular in this respect, involves two startling objections—viz. How does it happen that these bodies remain, like the stars, in a permanent state of luminous combustion, in free and empty space!—and why are they not, one and all, absorbed in the attraction of the earth as it traverses their column? If they are ponderous, opaque

bodies, and merely illuminated while traversing our atmosphere, they cannot compose the substance of a permanently luminous nebosity. Can, the meteoric stones which have fallen on the earth at various times—one on the 7th of November, 1492, another on the 27th November, 1627, a third in September, 1753, &c. &c.—and those others which have so frequently been observed during earthquakes and volcanic eruptions*—be one kind of shooting-stars!—and that the multitude of meteoric bodies, seen periodically from the 9th to the 12th of August, and on correlative days, if such shall be decidedly ascertained, are another kind? and will Lord Rosse's telescope possess the power of distinguishing between them!

III. In the third place, and of far more importance, we may hope, because there are rational grounds for hoping, that Lord Rosse will be able to discover the planets revolving round Sirius, Arcturus, Aldebaran, and other stars most near our solar system. Professor Nichol, in his eloquent work on the Architecture of the Heavens, observes that Sir John Herschel has lately requested attention, in the most express way, to the *minute and point-like companions* of such stars as—1. Ursæ, a.² Capricorni, a.² Cancri, γ Hydre, and α Geminorum, &c., as in some cases shining by reflected light; and, still more recently, his impression has been confirmed by what he saw in the southern hemisphere. "If these small silvery points," continues Nichol, "lurking within the rays of their respective suns, should indeed prove to be planets, the telescope will have performed the greatest of its achievements; and if upheld by observation as far as it can stretch, our knowledge of the physical constitution of matter shall ever enable us to state it as a general and necessary law, that all the orbs of space—not merely those which shine above us, but also the myriads whose wonderful clustering is seen in distant firmaments—that each one of this mighty throng is, through the inseparable exigencies of its being, engirt by a scheme of worlds proud as ours, perhaps far prouder, how immeasurable the range, how illimitable the variety of planetary existence!"‡

IV. Professor Nichol here decides that the discovery of the planets revolving round the fixed stars would be the greatest of the achievements of the telescope; yet there is another which may be justly pointed out as still greater, if among the possible achievements of any human instrument. In a word, the discovery of the grand centre of attraction, round which all the other heavenly bodies have been supposed to revolve.

It is to be recollected that Sir Wm. Herschel has ascertained that several of the fixed stars have a proper motion: a fact, he observes, that will admit of no farther doubt, from the continued observations, since it was first suspected, by Dr. Halley, and which demonstrates that Sirius, Arcturus, Aldebaran, &c., &c., are actually in motion, and that, in strictness, there is not one fixed star in the heavens. But, he adds, many other reasons will render this so obvious that there can hardly remain a doubt of the general motion of all the starry systems, and consequently of the solar one among the rest; and he indicates a point in the heavens somewhere near λ Herculis, as that to which this motion is directed.

* Professor Nichol's views of the Architecture of the Heavens. 3d edition, page 137.

† Transactions of the Royal Academy of Sciences and Belles Lettres of Brussels. Vol. VIII, 2d part, page 220.

* *Id. Id.* page 437. See also pages 62 and 434.

† Nichol's work above referred to, pages 69 and 66.

In pursuing this inquiry, he adverts to the *disappearance* of certain stars, and the appearance of others, since the time of Flamsteed, (who completed his catalogue in 1689,) observing that a slow motion in an orbit round some LARGE OPAKE

BODY, when the star which is lost, or diminished in magnitude, might undergo occasional occultations, would account for some of those changes. The following table will show the several circumstances adverted to on this occasion by Herschel :*

Constellations.	Stars lost or changed.	Newly-appearing Stars.
Hercules	{ 80, 81. 4th magnitude. 70 or 71. 5th magnitude	{ A star between 4th and 5th magnitude, following δ .
Cancer	26, 56, 73 or 74. 6th magnitude	{ A considerable star, between β and γ .
Perseus	19. 6th magnitude	{ Star of 5th magnitude, following τ .
Orion	62.	{ Star near ϵ and δ .
Pisces	108. 6th magnitude
Hydra	8
Comæ Berenicis	19, 34. 5th magnitude
Lacerta (Tail's-end)	{ A star between 4th and 5th mag.
Cepheus' Head	{ A star preceding 10.
Gemini	{ A star between 68 and 61.
Equulus	{ A double star of 1st class, prec. 1.
Sextans	{ Two stars following 1 and 7.
Bootes	{ Two considerable stars preceding γ and λ .

In four of these constellations certain stars have disappeared, and others have been recently observed. In three constellations stars have disappeared, but none new have been observed; and in six constellations new stars have been observed, where none have disappeared. These several constellations are dispersed in different parts of our hemisphere, and the area they encompass is immense, particularly at that distance where a star of the sixth magnitude would be eclipsed by an opaque body. Such a body, occupying such an area, could never have been in the contemplation of Herschel as the centre of attraction of the universe. This is not the region in which he would have sought it. An opaque body of such vastness would there cause not only the occultation of all stars of lesser magnitude than the sixth, but of all the distant nebulae intercepted by its disk. No stars would be visible in the greater portion of our heavens but those of the most considerable dimensions. It is, therefore, evident that, if these phenomena be caused by the interference of any opaque body at such distant intervals of space, there must be not a few of those bodies in our hemisphere, and some of them still more near us than stars of the fourth and fifth magnitude. It is barely possible that Lord Rosse's telescope may throw some light on this mysterious subject.

Herschel looks to a very different position, and a very different body, for the grand universal centre of attraction. "There are," he says, "two ways in which a centre of attraction so powerful as the present occasion would require, may be constructed. The most simple of these would be, a SINGLE BODY OF GREAT MAGNITUDE. This may exist, although we should not be able to perceive it by any superiority of lustre; for notwithstanding it might have the usual starry brightness, the decrease of its light, arising from its great distance, would hardly be compensated by the size of its diameter." * * * * "The second way of the construction of a very powerful centre may be the joint attraction of a great number of stars united into one condensed group." * * * * "If," he continues, "a still more powerful, but more diffused exertion of attraction should be required than what may be found in the union of clusters, we have hundreds of thousands of stars, not to say millions, contained in very compressed

parts of the Milky Way. Many of these immense regions may well occasion the sidereal motions we are required to account for; and a similarity in the direction of their motions will want no illustration."

† This latter alternative can scarcely ever be demonstrated by any telescope; because it can only afford *negative* evidence against the existence of a great central orb; and such negative evidence could never be decisive, unless we were acquainted with the actual extent of the universe, which in this remote corner is, we may assume, impossible. The other alternative may be within the scope of Lord Rosse's telescope, if, in penetrating into the profound infinitude of space, it can command a view of the actual centre of creation, and the evidence will be equally positive, although not equally satisfactory, whether the central orb be opaque or luminous. If opaque, it may observe the occultation or re-appearance—not of stars of any defined magnitude, however small, for it must lie far beyond them—but of the far distant nebulae occupying the remotest skirts of the universe. Without some happy concurrence of events, ages of vigilant observation must elapse before some future generation of men could be assured of the existence of such a body thus opaque, and therefore, probably, invisible. It might, however, happen to be visible. Ten thousand universes, consisting of millions of millions of suns revolving around it in their immeasurable orbit, might shed such a lustre on its expansive disk, as to yield us an imperfect and twilight view of this stupendous orb. But if this orb is luminous—if it pours around on every side unceasing streams of light, heat, and electricity, it would not be too extravagant a hope that this all-efficient telescope will bring us into acquaintance with so vast a mass of matter—equal in magnitude, or, at least, equal in gravity, to all the other bodies of the universe, attracting them all, and controlling all their movements. But whether this instrument, the most powerful that has yet been contrived and constructed by the ingenuity of man, will, or will not accomplish all the important tasks we have assigned it, of this we

* See Wm. Herschel's papers above referred to, 73d vol. pp. 397, 398.
 † Nicholson's Philosophical Journal, 15th vol., page 279, &c. &c.

may be assured, that it will lead us much farther than we have yet advanced in the knowledge of the immensity of the creation; and that every step it leads us will still more highly exalt our loftiest conceptions of the Deity. When we fill our minds with such contemplations, and then shrink back upon ourselves, with what contempt do we regard our wretched party feuds, and still more wretched sectarian bickerings. The earth we inhabit appears but an atom of dust in the mighty temple which God has erected for his own glory—and with redoubled glory consecrated to the happiness of beings, unnumbered and innumerable. If we know not the immensity of his works, how little have we learned of the all-wise, the all-good, the omnipotent, eternal, and infinite Creator!

A. C.

From the Dublin University Magazine.

THE LATE MRS. JAMES GRAY.

SUCH of our readers—and we believe they are very many—who from time to time have with ourselves welcomed Mrs. James Gray's contributions to our pages, will be concerned to hear that she is no longer with us. She died at Sunday's Well, Cork, on the morning of Tuesday, January 28th ult. She had scarcely entered on her thirty-third year, and with every hope of a maturity of powers, to which she was evidently fast attaining—it has been the mysterious will of God to remove her hence. Her death was, like her life, tranquil and happy, and full of peace; it was to a certain extent sudden, but by one, who lived as our friend lived, could hardly have been unexpected.

Mary Anne Browne was born at The Elms, near Maidenhead, Berkshire, on the 24th of September, 1812. The genius for poetry which in after years distinguished her, she exhibited from her cradle; and we have heard her say she could not recollect when she was not clothing her thoughts in verse. Even when of such tender years that her parents thought it too early to have her instructed in writing, she invented a sort of alphabet of her own, of which the letters were grotesque imitations of the characters of print, united with such abbreviations, as necessity compelled her to resort to. This she did for the purpose of noting down her thoughts; which, with many other individuals of similar gifts, she felt a kind of burden until recorded.

One of these early poems we have chanced on, and we shall print it, not so much that it may be contrasted with later productions, as rather for the purpose of showing her quickness in mental development. Cowley wrote verses, we believe, at fifteen; and Pope and Chatterton even earlier. The lines following, composed at thirteen, and bearing their deficiencies on their head and front, may be listened to, even after theirs whom we have instanced. Sorrowful sentences they are to issue from a mere child's lips; and the words in the concluding stanza—

“My sun too early risen, must set
Ere noon,”—

would now seem almost tinged with a prescient spirit. It *did* go down, “while it was yet day,” yet not in clouds, but in majestic brightness:—

“MYSELF—1825.

There was a time—a happy time,
And 't is not many years ago,
When grief I knew not, sin, nor crime,
Had never felt the touch of wo;
I was as other children then,
I ne'er shall be like them again.

I am a child as yet in years,
But not like other children. Strange
That woman's hopes and woman's tears
Should come on me, and work such change
So soon. But gone is childhood's chain,
My heart shall ne'er be young again.

I still enjoy some sportive hours,
But not with such an ardent breast;
I still can weave me fairy flowers,
But not with childhood's playful zest.
There is a something in my brain
That will not let it rest again.

It is for youth to weep at woe,
For age to hoard it in the heart;
But not a tear of mine will flow,
Though I have had of grief my part.
Mine is a hidden secret pain,
Tears I shall never know again.

I cannot look without regret
Upon the April morn of life;
My sun, too early risen, must set
Ere noon, amidst dark clouds and strife;
Who youth's sweet dream would not retain!
Who would not be a child again!”

With Miss Browne, the power of verse was not only an “accomplishment,” as our great Wordsworth terms it; it was an inherent possession. It was born with her, and it lingered with her even through the gloom of a dying chamber. A child of such early promise, it is not surprising her parents, with much pride, sought to second her inclinations; and a selection of these juvenile efforts appeared in 1827, under the title of *Mont Blanc, and other Poems*. Next year was published *Ada*, and in the year after but one, *Repentance*; which were followed, in 1834, by the *Coronal*; and, in 1836, by the *Birthday Gift*.

About this time Mr. Browne's family removed from their secluded residence in Berkshire to the town of Liverpool, for the purpose of giving the only son of the house* a mercantile education, to which he had destined himself. Higher feelings, however, after a little while swayed him; and his hours of recreation were devoted to studying for our own university, where having received his education with considerable credit, he was afterwards ordained for a field of duty in England. The extended literary opportunities which Liverpool afforded, exercised a very beneficial influence on Miss Browne's mind; and the knowledge of foreign literature, and more especially of German, which she now acquired, opened out to her new domains in the world of thought. Her name, which had now spread itself, brought an easy introduction to the Chorley family, to Dr. Shelton Mackenzie, and other *litterateurs*; and by Dr. Mackenzie's advice she was recommended to try her chances in our own magazine. Our number for June, 1839, opened with a *Midsummer An-*

* The Rev. Thomas Briary Browne.

ology, the first flowers of which were twelve Sketches from the Antique, followed by "a Merchant's Musings," and "a Sonnet to the late Adam Clarke"—and all by Miss Browne. In the same year, *Ignatia* was published by Hamilton, Adams, & Co., of London; and in the year 1840 a tiny volume of *Sacred Poetry*, containing many exquisite pieces, was issued by the same publishers.

Nor, while thus engaged in the bright realms of fancy, was Miss Browne forgetful of the real duties of life. Her desires to do good were all of a practical nature. The poor were ever in her regard; but she deemed it insufficient to bestow on them mere feeling or sympathy. Acts were wanting, and she gave them these tangible evidences. Few thought, on reading her poetry at this time, that much of it was penned in the intervals of the distressing duties of a district-visitor; or that the Miss Browne, whom many would have set down as a mere sentimental young lady, was day after day visiting the sick and infirm—strengthening the weak—cheering, with hopes of immortality, the dying.

In 1843, she was married to one in every respect capable of making her happy, a Scotch gentleman—Mr. James Gray—Himself the nephew and constant companion of the Ettrick Shepherd; his father before him had been the dear friend of Scotland's great poet, Burns—rarely have father and son enjoyed such honor! The Rev. James Gray was among the first and ablest vindicators of Burns' memory,* and he is yet gratefully remembered by his countrymen for such service. He was also one of the earliest to acknowledge the claims of his kinsman, Hogg, and to aid him with literary counsel and encouragement. As one of the founders of Blackwood's Magazine, and among its earliest contributors, his name must be also honorably mentioned; and when the project of establishing *Maga* was first bruited, he was among those proposed for the office of editor. Mr. James Gray, the younger, spent much of his early life at Mount Benger—diversified by occasional visits to Edinburgh in Hogg's company, where he found himself at home with Wilson and Lockhart, and the other knights of St. Ambrose. "It was curious," our poor friend one day remarked to us, "that while my scribbling habits brought me in contact with much of the literary genius of England; my husband should have mixed so much, in his youthful years, with the great spirits of Scotland."

On Miss Browne's marriage, she came to reside in one of the picturesque outlets of the city of Cork, Sunday's Well; and here all her later poems were written. Her little home here was a truly happy one, and though comparatively humble, few roofs in the adjoining city had so little repining, and so much of tranquil joy beneath them. Here she collected the materials for her last volume, *Sketches from the Antique, and other Poems*, which our own publishers brought out last year, and which our readers will find reviewed in our number of June last. We shall not now add to the

* "Mr. Gray," says Christopher North, "was the first who, independently of every other argument, proved the impossibility of such charges [drunkenness] by pointing to the almost daily effusions of Burns' clear and unclouded genius. For this, and for his otherwise triumphant vindication of the character of Burns from the worst obloquy it so long lay under, Scotland ought to be grateful to James Gray."—*Blackwood's Magazine*, May, 1823.

more obvious characteristics of her poetry, which we then took occasion to point out. There is an exquisite grace in her verse, and a rich melody flowing in sweetness like the music of the winding brook. There is no dash nor storm in her descriptions; but, on the other hand, neither have we to complain of what is tame and prosaic, and if we are not surprised, we are not at any time left disappointed. She did not essay high themes, in which failure is almost necessarily encountered; but she loved to delineate human griefs and joys, and to paint all those finer feelings which dwell more especially in the female breast. In all these respects she closely resembled Mrs. Hemans; and the good public, not satisfied with this sisterhood in genius, sought to establish a similar family connection, which did not subsist. They were alike in art, but had no other connection, and had never met. If Mrs. Gray did not possess that proud joy in chivalry, which brought to Mrs. Hemans so many heroes from the paladins and troubadours of the middle ages, it was because she had exchanged it for a reverential acquaintance with the old legends of Greece—its romantic history, and poetic religion. Her poems are the old *myths*, finely told us by the pure lips of a woman. The concluding series, given in our number for January, is, perhaps, the best; and with a sad fitness, the last of the *Sketches* was a "Hymn to Mors." How little deemed we, in the review of these poems to which we have referred, when speaking of the progress the volume sufficiently indicated, and pointing to future triumphs for its author, that it was the last book which should appear from her hands, or that with the incoming year, that head should be pillowed in the silent grave!

The eight volumes, the names of which we have given, comprise the whole of Mrs. Gray's writings, which she gathered together; but scattered in various periodicals, and in the annals, is to be found the *materiel*, both in prose and verse, of probably two or three more. As a prose writer she was hardly known; because, until only very recently, in all such contributions, she sought the anonymous. Our own pages, however, contain many graceful specimens of her power in this respect; and we believe we violate no confidence in instancing the "Recollections of a Portrait Painter." They were from Mrs. Gray's pen; and with only the disguise of an assumed profession for the writer, were simple facts—things which had come under her own personal observation.

Of the many members of the *corps* of literature whom it has been our fortune—good or ill—to have mixed with, we knew none who realized to us so entirely the Italian gift of "improvisation." She wrote, she has told us, as though from another's dictation; or as if transcribing from an open volume. Her thoughts, in their overflowing richness, yielded abundant supply, and she was never at a loss for expression. The poem of "Leodine," for example, which contains a hundred and twenty stanzas of four lines each, was the work of a single evening, yet it abounds in felicitous words and thoughts, and is distinguished by the same sweep of melody which characterizes all her compositions. So *facile* was she in versifying, and so almost necessarily were her words linked to numbers, that when not over-wearied by the drudgery of pen-work, she would write her letters home in verse: and we believe the last thing she laid hand to, was the "Christmas Carol,"

addressed to her venerable parents, in which she sent them filial congratulations and prayers for their good during the new year. "How my father's old eyes," she wrote, in enclosing us a copy, "will fill with tears, on seeing that though far away from him on that day, he is ever present to my thoughts!" And those aged eyes now can only rain down their weak torrents, that the daughter of such hopes is so soon laid low—"Gieb diesen," Schiller makes *Don Carlos* say, "Gieb diesen Todten mir heraus!"

Mrs. Gray's published writings we have enumerated; among her unpublished works, and which she herself destroyed, were some tragedies, also translations of many of Theodore Körner's finest lyrics, and of some of the impressive scenes in the *Faust* of Goethe. Twice she destroyed much of her literary labor—at her "two great burnings," as she termed them—lest in any way what she had done but for her private amusement, should be set forth in the glaring light of publicity. Once, a little while since, when her German translations, and studies in the language of the *Eichenland*, perished; and the former case was in earlier life, when the journals and jottings of youth, and the miscellaneous gatherings of "idle hours not idly spent," were all consigned to the flames. She no doubt exercised sound discretion with the latter; but we had wished her German studies had come down to us.

In furnishing our readers with this brief sketch of our gifted friend, we have purposely kept out of view allusion to that "inner life," into which the public may be excused penetrating. It is so difficult, besides, to observe the true limit in speaking of the departed, that we have spared ourselves in doing so. We regard with revolting shudder the "friend," who is not contented till the sacredness of domestic privacy be intruded on, and every half-spoken wish or word be stereotyped for the cold eye of the stranger. Suffice it, then, that Mrs. Gray's daily life was eminently beautiful. Her tastes were simple, pure, and womanly. The love of nature, which she acquired in the scenes of childhood, in riper years grew into a passion; and flowers, and trees, and the wild birds of heaven were companions of whose converse she could never weary. Her faith was true and unshrinking; and her piety was neither imaginary nor austere. She seemed ever happy, not because she had no cares, but because she felt anxiety to be at once useless and sinful. There was in her disposition much to admire, much to sympathize in; little that one could wish to be altered, and still less that one could desire taken away. The child of impulse very often; her impulses, notwithstanding, were controlled by gentleness and truth; while, in all things, her unselfishness was such as to be regarded by her friends as very characteristic.

We have outlined no perfect character, nor was it our desire to do so; for we know nothing could, were it possible, pain the dead more. She knew well the awful distance which divides the creature from the Creator, and she would have shrunk from appropriating, even in idea, what is the attribute of the Infinite alone. The feverish dreams of youth, with all their idle and passionate regrets, had given way to clearer light; and had Mrs. Gray lived, we might have looked for proud suc-

cesses for her. But it has pleased God to allot it otherwise, and we can only weave this tribute of our regret for her early departure:—

"These birds of Paradise but long to flee
Back to their native mansion."

And here is *Epidiccium* more worthy of regard than anything we have ourselves penned; bearing no unfamiliar name, but one sufficient of itself to commend it to our readers' kind attention:—

"TO THE MEMORY OF MRS. JAMES GRAY.

The spring hath woke her woodland choir,
Of bird, and stream, and breeze,
And touched the sweet but viewless lyres,
That sound from quivering reeds and moss-grown
trees;
Deep in the old untrodden woods,
When early sunbeams greet
Their green forsaken solitudes,
Waking the first young leaves and violets sweet.

But who shall wake for yearning love,
The voice whose echoes rise
From memory's haunted depths, above
All other pleasant sounds of earth and skies?
And who shall wake for us the chord,
That caught from classic strings,
The old world's dreamy music poured
In laurel groves, beside the Grecian springs?

How hath the hush of silence come
Upon the lip of song!
Why is there sorrow in the home
Where household love and gladness dwelt so long?
Woe for the grave that closed so soon
On life's unshadowed light,
The glory of a summer's noon
That saw no sunset fading into night!

Thou art not of the common dead,
Lost sleeper! and we mourn
Thee not as they. No dews are shed
From the dark fount of Lethe on thine urn;
But, far along the wastes of time,
Each loving heart and ear
Will catch the song, as from that clime,
Where sounds the harp, hushed, but unbroken,
here.

FRANCES BROWNE."

Stranorlar, February, 1845.

SONNETS OF THE SIDEWALK.

Loke wharf, 't is pleasant on clear bracing days,
When winds are light, and sky all cloudless fair,
Along thy sunny side to breathe the air,
Threading one's way amidst a crowded maze
Of busy men, and idly resting shipping—
Of barrels, bales, and boxes, Russia ducks,
Chain cables, anchors, horses, heavy trucks,
And truckmen truculent. Perhaps now dipping
With wistful heed, and seeming unaware,
A tiny straw in huge molasses cask,
And walking quick away, lest some might ask,
"Halloo, my friend, who said you might go there?"
O how much more doth sweetness sweeter seem
When stol'n—light more light in sudden gleam!

CORRESPONDENCE.

In this number we publish what we promised some months ago, a very interesting article upon Baron Swedenborg. About many of his religious opinions, especially upon his claim to direct inspiration, the mass of our readers would differ from the followers of the Baron, and there would be no ready way of bringing such pretensions to any satisfactory test. But the publication which is here reviewed, makes for Swedenborg very extraordinary claims as a discoverer in natural science, which appeal to the knowledge of a very numerous class of persons who have no religious sympathy with him—and it would appear to be easy to ascertain whether they are well founded or not. Some of the wonderful instances of alleged supernatural knowledge will be interesting to all, whether they believe or disbelieve.

We give a little Punch which came by the Great Western, and hope that our next number may be made up from the April magazines expected by the Boston steamer.

Mr. MONCKTON MILNES, M.P., is preparing a life of Keats; for this purpose, all the necessary papers have been placed in his hands by the family. He is also going to bring out, at his own expense, a sumptuous edition of Keats' works. This is a rare, but proper tribute from one poet to another; rare, perhaps, because poets are seldom able to afford such tributes.

It has been stated that a pension on the civil list has been granted to Mr. Thomas Hood, the distinguished comic writer. We understand, however, the fact to be, that a pension of 100*l.* a year has been conferred on Mrs. Hood, the wife of that gentleman, in consideration of his great literary merits, and the infirm state of his health.—*Observer.*

H. B. is engaged on a new and extensive work, not of caricatures. He is to give portraits, in his own peculiar style, of all the celebrated men of science, literature, art, and politics. A letter-press sketch will accompany each portrait.

Miss GERALDINE JEWSEBURY, the author of the new novel called "Zoe," is the sister of the lady of the same name, well known for her poetry, who some few years since married a clergyman, and died of the cholera in India.

BOOKS RECEIVED.

Messrs. Harper & Brothers have sent:

No. 23 of the ILLUMINATED BIBLE.

THE GAMBLER'S WIFE.—Select novels, No. 50.

HARPER'S ILLUMINATED SHAKESPEARE, Nos. 47—48.

ISABEL; OR, TRIALS OF THE HEART—for the Young.

MAN AT ARMS. By G. P. R. JAMES. Vol. 7, Select novels.

VERONICA; From the German of Zachokke.

ARTHUR'S LADY'S MAGAZINE for May. We have not been able to look over this work, but can recommend it from the character of the editor.

From Saxton and Kelt, Boston.

KRUITZNER, The German's Tale. By Miss Lee. This is a handsome edition of a popular book.

THE MANAGING WIFE. By Mrs. Ellis.

A PLEA FOR THE SABBATH. By Judge Hall of Delaware. This is addressed to the Lawyers of the United States.

THE PALAIS ROYAL. An Historical Romance. By John H. MANCUR; author of *Henri Quatre*; *Tales of the Revolution*, &c. *W. H. Colyer, New York.* We have not read this Historical Novel, by an American author who appears to emulate the industry and talent of James, but a friend, to whom we gave it, assures us that it is much better than the novels of the day. We wish well to the labors of the author.

SMITH'S WEEKLY VOLUME, Nos. 11—15. These numbers of this weekly reprint contain the conclusion of the Quaker Family, and Literary Ladies of England, by Mrs. Elwood. This is not yet finished, but contains much very attractive matter, about persons to whose characters and memory every reader of English literature attaches great interest.

SILLIMAN'S AMERICAN JOURNAL OF SCIENCE AND ARTS, No. 98, contains—Galvanography; Dr. Hare's remarks on a recent speculation by Faraday; Zinc Mines in New Jersey; Dr. Morton on a Fossil Crocodile in New Jersey, and on a second series of Ancient Egyptian Skulls; Catalogue of Connecticut Shells; Meteoric Stars Fossil Footmarks in Pennsylvania; Idea of an Atom; Drift Ice and Currents of the Atlantic;

Meteoric Iron fell in New York ; Various Reports and Journals—and much Miscellaneous science. Messrs. Jordan & Co., Boston.

PROSPECTS OF SLAVE-TRADE SUPPRESSION.

THE *Constitutionnel* reports that the Duc De Broglie has instructions to propose, as a substitute for the anti-slavery right of search, a blockade of the African coast by combined squadrons. As this is precisely our arrangement with the United States, the proposal, and its adoption too, are highly probable. The absurdity of a crusade against slavers will then have reached the climax : three men-of-war maintained to do the work of one ! Let us endeavor to realize the extravagance of the arrangement by supposing it adopted in our domestic police. Let us imagine that, as a concession to young Ireland, Irish pickpockets are only to be arrested by Irish policemen ; and that Scotland claims to be put on the same footing as Ireland. In that case, our police, detective and ordinary, must cruise in threes ; and a preliminary inquiry into the nationality of each delinquent must be instituted, to determine whether the Scotch, the English, or the Irish policemen, is to apprehend him. The delicacy and danger of analogous discussions, where stout and well-armed frigates, manned by hardy and more than half-hostile crews, stand in the place of our imaginary policemen, can be easily imagined.

Yet it is not easy to see what substitute can be found for this clumsy and extravagant plan. The right of capturing and destroying slavers presupposes a right of search ; and this right the United States will only allow to be exercised in the case of their own vessels by their own men-of-war. France, we may be sure, will never rest until the concession be made to her national pride that has been made to the national pride of the United States. The three-policemen system is indeed the only possible one, if we persist in our quixotic project of suppressing the slave-trade by force of arms. The absurdity may not stop here : Spain, Portugal, and Brazil, may insist on having their policemen too.

There is another cross-grained impediment about to be laid in our path. It is a legacy from John Tyler. On his political deathbed, that virtuous and great statesman, passing in review his shortcomings in office, has bethought him of his neglect to struggle against the slave-trade. To make amends, he has at the last moment caused a searching inquiry to be instituted by his agents in Brazil into the way in which it is carried on. The investigation has not added much to our previous knowledge ; but it has enabled John Tyler to devise a plan for the better suppression of the slave-trade and bequeath it to the heir of his honors. Like many other "convertites" of his class, John Tyler is more touched with the sins of others than with his own—he shows more anxiety to correct the backslidings of Great Britain than of the United States ; and, with all the emotion of Mother Cole, the dying sinner hopes "that her Britannic Majesty's government will upon a review of all the circumstances stated in these despatches, adopt more efficient measures for the suppression of the trade, which she has so long attempted to put down, with, as yet, so little success."

The hypocrisy and general falsehood of this cant are rank. But there is a substratum of truth in it. Experience shows that our cruisers cannot

put a stop to the slave-trade. They only force the crimps to take three cargoes for one ; and to give up the two supernumerary cargoes to supply laborers to the British possessions. The French and American cruisers against slave-ships had no good-will to the work from the beginning ; and the idea that Great Britain alone derives any benefit—however trifling and dearly-bought that benefit may be—from this thief-catching on a large scale, will not increase their liking for it.

The system of armed intervention to suppress the slave-trade is rapidly breaking up. It is true, there is little danger that the trade will under any circumstances again be legalized by France or the United States. France has little interest in it ; and her anti-slavery interests, backed by the manufacturers of beet-root sugar are strong enough to prevent its resumption. In the United States there is a paramount interest hostile to its resumption. The non-slaveholding states will not hear of it ; and in the slaveholding states the home breeders of slaves will claim protection against the imported article. The landowners of the southern states will struggle as resolutely for a monopoly in the growth of slaves, as the landowners of England for a monopoly in the growth of wheat. The recent insurrections in Cuba have rendered many of the inhabitants averse to further importations of slaves ; and in Brazil, it is only the sugar-planters on the coast—the debtors and thralls of the speculators in slave-importation—who are much interested in the perpetuation of the slave-trade. Beyond its actual limits, the slave trade is not likely to extend, as within those limits it has been found impossible to narrow it by the means hitherto pursued. Now would be the time to try something rational.—*Spectator*, 22 March.

THE MANIA OF COLLECTING.—In the first impression of Hogarth's "March to Finchley," dedicated to the King of Prussia, one letter in his Majesty's name was accidentally omitted, a copy of which sells for ten times the sum of one that has "Prussia" with two s's ! The late Queen (Charlotte) had one of them at Frogmore.

Thus "The Vinegar Bible," or the folio copy, which, in the headings of the pages, reads "The Parable of the Vinegar," instead of "The Vineyard," is another literary curiosity. The late Duke of Sussex possessed a copy of this, as of every other that is rare and curious from more intrinsic merit. Another example is the early edition of *Littleton's Latin Dictionary*, (noticed before,) p. 31, where the translation of "condog," for "concurro," occurs as the blunder of a literary amanuensis.—*Poynder's Literary Extract*.

CHARITY.—"I fear," said a country curate to his flock, "when I explained to you, in my last charity sermon, that philanthropy was the love of our species, you must have understood me to say 'specie,' which may account for the smallness of the collection. I hope you will prove, by your present contribution, that you no longer labor under the same mistake."—*ib.*

CALLING OUT.—When Sir John Elliott, the physician, was dining with Dr. Armstrong, Sir John was, very early in the repast, called out. Armstrong, on losing the quiet enjoyment of his friend's company, muttered out roughly, "I did not think you would have sent for yourself so soon."—*ib.*

From the Monthly Review.

The Animal Kingdom considered Anatomically, Physically, and Philosophically, by Emanuel Swedenborg, late Member of the House of Nobles in the Royal Diet of Sweden, &c., &c., &c. Translated from the Latin by JAMES JOHN GARTH WILKINSON, Member of the Royal College of Surgeons of London. 1 vol. Newberry, and Ballière. London: 1844.

MEN of slender pretensions, and even those taking high rank among the *peritissimi* of the day, have been accustomed to dismiss with a sneer, or condemn with a scowl, all mention of, or reference to, Emanuel Swedenborg. The enthusiast, visionary, monomane—the man who affected to converse with beings of another world—the cabalistic, mystic *qui naviget Anticyram dignus*—in short, “the madman dreamy.” “A person,” say they, “who pretended to enjoy intercourse with invisible beings, who affected to be able to converse with the spirits of the departed, and who indulged in the delusive fancies of a heated if not disordered brain, can surely lay no claim to the title of a man of science, or pretend to be expositor of the all but hidden laws of nature. It is not consonant with the views which we entertain of the sanity of men’s minds, to admit Swedenborg among the penates of our literary mythology. We can have no feeling in common with a man who assumes the possession of such superior gifts, that were he indeed possessed of them, or did we admit his pretensions, we must immediately abandon all, or nearly all, the principles which have hitherto guided us in the contemplation and study of nature, for such a man would be only not a god because he is (or was) a creature.”

This, or something like this, is the opinion either expressed or implied of most persons with whom we have conversed respecting Swedenborg and his works, and it is not derogatory to us to say, that until we perused some of his works—such is the influence of early academic prejudice—that we were just as much inclined to unite in the general censure, as are those to whom we have just now alluded. That Swedenborg was really a learned, scientific, studious, and highly-gifted man few seem to know and fewer stop to inquire. That he was of a highly respectable family, his father being the Bishop of Skara, and his mother, Sarah Behm, the daughter of Albert Behm, assessor of the board of mines, and that he filled some of the most honorable offices in his own country, and retired only to London to devote himself to his theological pursuits, are facts little known even to those whose business is literature, and who live not only metaphorically but literally by the sweat of their brains. Let it therefore be our duty on this occasion to put these facts fully before our readers, and in the light in which we think they ought to be placed, with a view to attract that attention to the work, the title of which is placed at the head of this article, which we think its importance demands, and its merits will secure. And to further this end, we shall give a very brief sketch of the life of Swedenborg, interspersed with occasional anecdotes of demonstration of possession of those supernatural powers, for which his followers give him credit; but upon the truth or untruth of which we shall not at present delay to inquire, whatever our opinion may be, seeing that is a separate subject, of which possibly we may treat at no distant date, when

criticizing some psychological or metaphysical work. In this short sketch we shall avail ourselves principally of a work by the Rev. J. H. Smithson,* and the *Life of Swedenborg*, by Mr. Wilkinson, in the *Penny Cyclopædia*, together with such facts and illustrations as our reading may supply, and our habits of generalization may enable us to bring forward.

The original name of the family was *Svedborg*; but when the subject of our sketch was ennobled in 1719, as is the custom in Sweden, he changed his name, together with his sisters', to Swedenborg. Under his father as a divine, a man of learning, of exemplary piety and prudence, “he could not fail to receive a good education according to the custom of the times, and such as was adapted to form his youth to virtue, to industry, to solid knowledge, and especially to those sciences which were to constitute his chief occupation.”—(*M. Sandel's Eulogium*.) How he past his youth does not appear from M. Sandel, whose eulogy we have taken as a text, but at twenty-eight, he was appointed, without any solicitation on his part, by Charles XII., assessor extraordinary of the board of mines, and this was while he was yet a student of the university. If we reflect that Sweden is a country, the chief riches of which arise from a proper working of her mines, it will redound much to the honor of Swedenborg that he was appointed to so important an office; and the appointment presupposes that the fame of his talents and acquirements must have been widely diffused and generally acknowledged, since it reached the king's ear—a rare occurrence, and seldom happening even to those who live in a country like England, which may emphatically be called a land of news and newspapers, for there is nothing done, said, whispered, *thought* almost, but what finds its way either into the diurnal or hebdomadal journals of the metropolis, to be thence circulated not only among the highest and the lowest in the land, but disseminated over the four quarters of the globe. And the appointment was conferred moreover in a manner that could not but have been grateful to the feelings of Swedenborg, since it was left to his choice whether he would accept the office of professor in the Royal University of Upsal or that of assessor of the mines; and M. Sandel very justly remarks, that it is not upon an effeminate young man, destitute of talents, that an enlightened monarch confers such employments: Swedenborg was already known, both within the kingdom and abroad, for his learning and his great qualities.

In 1710, when 22 years of age, he published a collection of Latin poems,† which displayed great versatility of talent and raised his character for learning among his countrymen. But even at this early period poetry did not engross all his time, as it too frequently does youth at that period of life, for he printed essays, and remarks on questions of mathematics at Stockholm, in the Swedish language, in six parts, the fifth being also published

* Documents concerning the life and character of Emanuel Swedenborg, &c., &c., collected by J. F. I. Tafel, of Tubingen, and edited in English by the Rev. J. H. Smithson. Hayward, Manchester, 1841.

† Entitled “*Ludus Heliconius, sive carmina miscellanea, quæ variis in locis cecinit Em. Svedberg*,” and the preceding year he had published “*Annæi Senecæ et Publîi Syri Mimi, forsan et aliorum, Selectæ Sententiæ cum annotationibus Erasmi, et Græcâ versione Scalgeri, notis illustratæ*.” This work is dedicated to his father.

in Latin, under the title of *Dædalus Hyperboreus*. These were the fruits of his acquirements at the University of Upsal. Subsequently, for four successive years, he visited England, Holland, France, and Germany, acquiring the languages and making himself acquainted with the knowledge of these countries. M. Sandel represents him, at this period of his life, as a young man of strong memory, quick conception, and sound judgment, deeply imbued with the desire of acquiring the most profound truths, in philosophy, in all the branches of mathematics, in natural history, mechanics, anatomy, and even theology. He was also skilled in the Oriental languages, and had, at this early age, acquired the habit of arranging his thoughts in a methodical and orderly form, as numerous notes in several of his note-books amply prove. On his return from his first travels, he occupied himself with mathematics and mechanics—in the latter science he attained such eminence that he attracted the attention and subsequently secured the friendship of Christopher Polhammer, who was afterwards known as Polheim, and the "Archimedes of Sweden." Among a number of extraordinary works projected and carried into effect by these two able men, the famous dyke of Lyckeby, the locks of Trolhatta, and the bason of Carlsrona are still the admiration of travellers; but one that was planned and executed by Swedenborg, attests without any cavil a knowledge of mechanical principles and their application to objects of utility that must surprise every one who reflects upon the nature of the undertaking.

In 1718, he contrived to transport over valleys and mountains, by the help of machines of his own invention, two galleys, five large boats, and a sloop from Stromstadt to Iderfjol, which divides Sweden from Norway towards the south; that is to say, the distance of two miles and a half.* By this operation, the king found himself in a situation to carry on his plans; for, under cover of these galleys and boats, he transported on pontoons his heavy artillery, which it would have been impossible to have conveyed by land, under the very walls of Frederickshall. (M. Sandel.)

Mechanics, however, did not alone occupy his attention; for in 1717 and 1718 he published a continuation of *Dædalus Hyperboreus*—an *Introduction to Algebra*, under the title of "Regel-Konsten;" in 1719, a "Proposal for fixing the value of coin, and determining the measures of Sweden, so as to suppress fractions and facilitate calculations;" in the same year, a treatise "On the Position of the Earth and the Planets;" and another "On the Height of the Tides and the greater flux and reflux of the Sea in former ages; with proofs furnished by various appearances in Sweden;" so that it will readily be acknowledged that a mind which could grasp a theory of planetary position, and the minutæ of pecuniary values at one and the same time, could not have been cast in any ordinary mould. Besides these works, we are told, that he had begun others, while he applied himself with determined perseverance and indomitable industry to a thorough and comprehensive knowledge of mining, as

He was unwilling to exercise the functions of assessor of the royal board of mines, before he had acquired a perfect knowledge of metallurgy. "Thus," continues M. Sandel, "he is by no means to be ranked in the number of those, who, without capacity, solicit places, and have not the

* Equal to 14 English miles.

knowledge requisite for filling them. He had obtained his office without soliciting it. He was already well skilled in certain sciences, which alone would render him very useful in his situation. It was even very easy for him to acquire the knowledge in which, for this office, he might be deficient, since mathematics and physics, which he had hitherto made his principal studies, are the basis of the science of mines. But he could not be satisfied with theory alone without practice; nor was he any better satisfied with the experience which may be acquired in a chemical laboratory, nor with an acquaintance with the mines of Sweden only, and with the buildings, machines, and processes used in working them. He therefore, in 1721, undertook a second journey to foreign countries, to examine their mines and smelting works, particularly those of Saxony and Hartz. But we ought not to say that he went to examine their mines only: for of all that could fix the attention of a traveller, there was nothing that escaped him."

During his sojourn at Brunswick, the reigning duke gave him full power to travel in his dominions, and at his departure, presented him with his medallion in gold and another in silver. It was during this journey that he acquired those stores of knowledge which enabled him to enrich science and advance the arts by the publication of seven original works, the translations to the titles of which we append in a note.* In 1722, he returned to Sweden, and divided his time between his duties at the Royal Board of Mines, and his favorite studies, the fruits of which was his great work, entitled *Opera Philosophica et Mineralia*, which was published at Dresden and Leipsic—and during the printing of which he actually visited the mines of Austria and Hungary—a journey which lasted a year. This elaborate performance is in three volumes folio. The first volume is entitled, *Principia Rerum Naturalium; sive Novorum Tentaminum Phenomena Mundi Elementaris Philosophice Explicandi*; 2nd. *Regnum Subterraneum, sive Minerale de Ferro*; 3rd. *Regnum Subterraneum, sive Minerale de Cupro et Orichalco*.† The merits of these works were immediately acknowledged and admitted by the learned, and the Consistory of the University and the Academy of Sciences at Upsal were the first to do him honor in token of the opinion they entertained of his

* *Prodromus Principiorum, &c.* "A Prodromus (or sketch and specimen) of a Work on the Principles of Natural Things, or New Attempts at explaining the Phenomena of Chemistry and Physics on Geometrical Principles." 2. *Nova Observata, &c.* "New Observations and Discoveries respecting Iron and Fire, especially respecting the Elementary Nature of Fire. With a new mode of constructing Chimneys." 3. *Methodus nova, &c.* "A New Method of finding the Longitude of Places either on Land or at Sea, by Lunar Observations." 4. *Modus Construendi, &c.* "A Plan for constructing Dry Docks for Shipping, in Harbors where there are no Tides." 5. *Nova Constructio, &c.* "A New mode of constructing Dykes to exclude Inundations of the Sea or of Rivers." 6. *Modus Mechanice, &c.* "A Mode of ascertaining by Mechanical Means, the qualities of Vessels of different Constructions." 7. *Miscellanea Observata, &c.* "Miscellaneous Observations on Natural Things, particularly on Minerals, Fire and the Strata of Mountains."

† The entire work is entitled, "Philosophical and Mineralogical Works," and the 1st vol. "The Principles of Natural Things; or New Attempts at a Philosophical Explanation of the Phenomena of the Elementary World." 2nd. "The Subterraneous Kingdom in regard to Iron;" 3rd. "The Subterraneous or Mineral Kingdom in regard to Copper and Brass."

talents and acquirements. The Consistory previously, in 1724, had offered him the professorship of the Pure Mathematics; and the Academy of Sciences had elected him a member in 1729. It cannot, therefore, be supposed that either of these learned bodies had been taken by surprise, or that Swedenborg owed the honors which at this time were heaped upon him to any sudden freak which had seized the learned, or any new fashion in literature which had attacked the people. They were the fruit of a long and intimate acquaintance with the character and works of a man who they foresaw was to be not only an honor to his own country but to his species, and they wisely gave him that suffrage which foreign nations are only now (if we take Mr. Wilkinson's translation as a proof) beginning to award him. Foreigners, however, were not altogether blind to the merits of Swedenborg, for the Academy of Sciences of St. Petersburg elected him a corresponding member by diploma in 1734, and Christian Wolff,* whose

* Christian Wolff, or Wolfe, or Wolfius was born at Breslau in 1679. After prosecuting his studies at the Universities of Jena, Hamburg, and Leipzig, he acquired so much renown, that at 26 he was appointed professor of Mathematics, and soon after of General Philosophy, in the University of Halle. Having read Leibnitz's *Theodicaea*, (or a "Dissertation on the Goodness of God, the Liberty of Man, and the Origin of Evil," *vid. Ed. Gottschedii cum Annot. et Gall. Elii. Amstelod. 1734, cum vita auctoris a L. de Neufville*; also Clarke—"On the Being and Attributes of a God." Lond. 1717, 8vo.) he was seized with the desire of adding to that primary work, and accordingly, upon Leibnitz's doctrine of monads he erected a new system of Cosmology and Pneumatology reduced and brought down to a mathematical level. This work is the one on the human soul we have named in the text. He added afterwards to his system, "Ethics and Policy," and by this time he began to be considered one of the most learned men of Europe, but the opinions which he entertained on the doctrine of necessity, gave offence to his colleagues, whose learning was not equal to their jealousy, and having delivered an oration in praise of the morality of the Chinese, their jealousy broke forth into a flame, and an accusation of heresy was preferred against him publicly at the University of Halle and thence was transferred to the court at Berlin. He endeavored to defend himself from this accusation by writing a treatise on Fatality, but unsuccessfully; for a royal mandate decreed his banishment from the Prussian dominions. This was in 1723. The landgrave of Hesse Cassel having formerly invited him to fill a professorship in the University of Cassel, he now went there, and was not only kindly received, but was appointed to a professorship by the prince. In the mean while, the question as to the censure of Wolff excited the organ of literary combativeness in all the Universities of Germany, and Wolfians and Anti-Wolfians argued, talked, wrote, scolded, quarrelled, and even fought with all the fury and bitterness of the Constantinopolitan factions—liberty and necessity being the sign and counter-sign; but in process of time, in the course of nine years, the current of public opinion ceased to run against Wolff, the King of Prussia reversing his sentence of exile, and he returned as Vice-Chancellor of the University of Halle, where (such is the mutability of human affairs!) he was received with every demonstration of triumph and respect. From this time forth he employed himself on his Institutes of Philosophy, which he lived to accomplish in every part with the exception of "Policy." He was created a baron by the Elector of Bavaria, and after the death of Ludwig succeeded to the Chancellorship of the University. He died in 1754. Wolff possessed a methodical understanding, says Enfield, which by long exercise in mathematical investigations was particularly fitted for the employment of digesting the several branches of knowledge into regular systems; and his fertile powers of invention enabled him to enrich almost every field of science in which he labored with some valuable additions. The lucid order which appears in all his writings enables his readers to follow his conceptions with ease and certainty, through the longest trains of reasoning. Such then was the man who now sought the acquaintance, and probably

"System of Philosophy," and "Thoughts on God, the World, and the Human Soul," had raised him to the highest rank in literature, sought for and established a friendly correspondence with him, consulting him, as M. Sandel says, on many intricate subjects. The editors also of the "Acta Eruditorum" of Leipzig helped themselves largely to the treasures which were everywhere throughout his works scattered with no sparing hand. They did not, however, appropriate his labors without acknowledgment. M. Sandel also remarks that time had not deprived the "Opera Philosophica et Mineralia" of any of their value since, the authors of the magnificent work, "Description des Arts et des Métiers," then publishing in Paris (1772) had appreciated that part which treats of iron and steel so highly, that they had translated and inserted it entirely in their collection, while the editors of the "Documents" inform us that the work did not fail also to obtain notice in England. In the translation of Cramer's "Elements of the Art of Assaying Metals," by Dr. Cromwell Mortimer, Secretary to the Royal Society, we find the following very eulogistic passage:

"For the sake of such an understand Latin, we must not pass by that magnificent and laborious work of Emanuel Swedenborgius, entitled *Principia Rerum Naturalium, &c.* Dredsdæ et Lipsiæ, 1734, in three tomes, in folio; in the second and third tomes of which he has given the best accounts, not only of the methods and newest improvements in metallic works in all places beyond the seas, but also of those in England and our colonies in America, with draughts of the furnaces and instruments employed. It is to be wished that we had extracts in English. (p. 13, 2nd ed. London, 1764.)"

M. Sandel, who, it must be kept in mind, entertained opinions diametrically opposed to those theological dicta which Swedenborg promulgated in his latter years, wishing to avoid any discussion upon their merits, expresses himself in the following manner:—

"I have hitherto only spoken of one part of the works of Swedenborg; and as those which follow are quite of a different nature, it becomes neces-

sitated to mention the other part, which has profited by the correspondence, of Swedenborg; and we have been thus careful in drawing an outline of his life, to show that that man whose works attracted the attention of such a person must have been of no common mind, and is at least entitled to a fair and legitimate trial on his merits at the bar of the court of English criticism. We are too fond of restricting our praises and approbation to those who row with us in the same boat, and fancying that there are no other ferrymen to truth but those on whom our election has fallen. As we proceed, we shall have other opportunities of proving the estimation in which Swedenborg was held by his brethren on the continent, but in case it should slip our memory, we would ask a question here of those who have studied all of Swedenborg's works, for we confess to the reading but of a portion of them, how far his doctrine of degrees and Series and Concordance of Systems (*vide prol. to Anim. Kingd. n. 14, p. 10. of Wilkinson's trans.*) agrees with that of Leibnitz on the nature and communication of substances and of the union between body and mind, and the preëstablished harmony between the body and soul of man, the prolegomena of which was first published in the *Parisian Journal*, 1695? We think, if a careful and elaborate comparison were established between that portion of Swedenborg's works, especially the tract entitled, "Intercourse between the Soul and Body," and the specimen of Leibnitz, just alluded to, some correspondence of ideas might be detected; and if so, it would go far to put Swedenborg in that position which we think he has not hitherto held in this country, because his works have been sealed volumes even to the learned.

sary that we should yet dwell a little longer on these first. They are so many incontestable proofs of a universal erudition, which attached itself in preference to objects which require deep reflection and profound knowledge. None can reproach him with having wished to shine in borrowed plumes, passing off as his own the labors of others, dressed out in a new form and decorated with some new turns of expression. It must be acknowledged, on the contrary, that without even taking up the ideas of others, he always followed his own, and often makes remarks and applications which are not to be found in any preceding author. Nor was he at all of the same class as the generality of universal geniuses, who, for the most part, are content with merely skimming over the surfaces of things. He applied the whole force of his mind to penetrate into the most hidden things, to connect together the scattered links of the great chain of universal being, and to trace up everything, in an order agreeable to its nature, to the first Great Cause. Neither did he proceed in the manner of certain natural philosophers and mathematicians, who, dazzled by the light which they have been in search of and have found, would, were it possible, eclipse and extinguish, to the eyes of the world, the Only True and Great Light. He, in the course of his meditations on the universe and on creation, continually found new occasions for rising in love and adoration towards the Author of nature."

This beautiful passage coming from one who like ourself admired Swedenborg for his depth of erudition and comprehensiveness of mind, irrespective of those sentiments and feelings with which the members of the church of the New Jerusalem contemplate him, is to be considered as a fair exposition of the opinion which all learned men who have taken the trouble to read and patiently examine his works, entertain of Swedenborg, and in which, after a perusal of some of them, we entirely concur. As M. Sandel has remarked, he constructed a system for himself, the arrangement of which is so solid, and the component parts of which are so skilfully put together, that it never fails to claim the approbation of any man who will take the trouble to make himself master of the principles by which he was guided in the formation of it. According to this system, he explains all that the most certain facts, and the soundest reasoning can offer to our meditations—and in short, as we shall presently show, anticipated the discoveries of many of his successors. If we dare not adopt the whole, says M. Sandel, there are at least many excellent things in it which we may apply to our use. He wished to combine his system with religion, and to this object he more especially devoted his time, his energies, his talents, his fortune, and his life, after the completion of the *Opera Philosophica*. He passed the greater part of his latter years in foreign countries, making no less than eight different voyages for that purpose. The countries that he visited were England, Holland, France, and Italy. His principal object in travelling was the printing and dissemination of his works, and it is impossible not to feel surprise at the amazing fertility of his pen. The bare enumeration of the titles would require more space than we can spare, and consequently we must request those who are desirous of knowing more of his writings to refer to the "Documents," or the article to which we have already alluded in the *Penny Cyclopædia*, and the *Eulogium* of M.

Sandel. We may briefly state, however, that though the subjects of them are different, they are all nevertheless founded on anatomy, physics, philosophy, the Holy Scriptures, and certain visions and revelations which conduct us, according to the manner of treating them, to serious meditations respecting the Supreme Being, the soul, things visible and invisible, and the life hereafter. "We thus," says M. Sandel, "now find soaring above the clouds, the same man whom we have just been following in the mines, in furnaces, and workshops; and we find him everywhere equally diligent, zealous, and fertile in emblematical illustrations." Having filled the office of Assessor to the Mines for thirty-one years, he applied for, and obtained permission to resign his post, at the same time craving that no new rank should be conferred upon him, and only half* his usual salary. This of course was granted him, (1747.) The editors, in a note to the "Documents," state, that in the English version of M. Sandel's *Eulogium* previously published, Swedenborg is made to desire that this favor should be granted to him without *derogation* of rank or title, whereas, the expression is, *sans AMELIORATION de rang ni de titre*. They further add, that it was no doubt customary in Sweden, as in this country, "to reward a faithful public servant, on his retirement, with a pension proportioned to the length and value of his services, and to raise him to a higher degree of rank or title. It is elsewhere stated that such an offer was actually made to Swedenborg on this occasion; it was proposed to raise him from the first rank of nobility to the second; and thus to confer on him the title of Baron; and most probably, this would have been accompanied with an addition to his former income, to enable him to support his new dignity in a suitable manner; but he, as a man for whom neither wealth nor power had any attractions, declined the title altogether, and requested that only one half of his former income—just as much as was sufficient to keep him from want, and to enable him to publish his works on which he was engaged—might be continued to him. ("Documents," p. 18.)

The editors then take the opportunity of denying the general report that Swedenborg became deranged some time before his death. This derangement is said to have occurred *after* he had a fever in London: but as it is positively stated, and we see no reason to question the statement, that Swedenborg *never* had a fever, we cannot any longer subscribe to the general opinion that this illustrious man was in any way ever deranged previous to his death. It must be recollected that the same opinion has gone abroad, that Newton was insane for many years before his demise—but we refer to the subject with pain, and dismiss it with haste. It is somewhat difficult, even at the present day, to determine what is, and what is *not* insanity. Mr. Dyce Sombre was declared insane by the London Inquisition of Lunacy, yet the Paris physicians declare him sane. Neither do the rules which Mr. Taylor† has recently laid down in his *Medical Jurisprudence*, afford us any sure guides in the investigation. Is it not possible to believe that at certain periods entire nations have gone mad, and continued mad for ages? Were the crusades indications of mania? The tulipo-

* Swedenborg, as we shall see presently, says the whole.

† *A Manual of Medical Jurisprudence*. By Alfred Taylor, &c., 1844.

mania! The balance of power in Europe! The sinking fund, or the late cry of the church in danger! Was the reform agitation a symptom only, or a real attack! We must not question too closely the actions even of ourselves at all times and on all occasions, otherwise who would escape the imputation of insanity! However, we are not prepared to argue the question at present, for it would lead us into investigations and inquiries, and entangle us in intricacies and sophistries, from which, possibly, no after-wit could extricate us.

On the subject of the fever with which Swedenborg is said to have been attacked, M. Sandel seems to give it the most unqualified denial. "*He always enjoyed the most excellent health, having scarcely ever experienced the slightest indisposition;*" and the editors remark in a note to the "Documents :"—(p. 23.)

"How inconsistent is this with the story which has been invented, and propagated in this country, that he was once attacked with a most violent fever, attended with delirium, from the effects of which he never recovered! In Sweden, where his personal history must have been best known, nothing, it seems, of the kind was ever heard of."

So far, therefore, as human testimony is valid, and human evidence entitled to credit, we must conclude, that Swedenborg was never attacked by fever, and, consequently, that he never was, and never could have been at any period of his life, afflicted with lunacy. All that M. Sandel says of his illness, is,—

"During his last residence in London, on the 21th December, last year, (1771,) he had an attack of apoplexy: and nature demanding her rights, he died on 29th March in the present year, (1772,) in the eighty-fifth year of his age; satisfied with his sojourn on earth, and delighted with the prospect of his heavenly metamorphosis."

With the following extract from the *Eulogium* we must close this very brief notice of the biography of this really great man, whose merits seem now, for the first time, likely to be generally recognized in England.

"Suffice it then to say, that his merit and excellent qualities shine with brilliancy, even where we are endeavoring to discover in him the weakness inseparable from human nature. I do not come here to defend errors or unintelligible principles: but I will venture to assert—and I reckon, gentlemen, on meeting your approbation in the assertion—that where others would have discovered a deficiency of intelligence and a confusion of ideas, Swedenborg has discovered an astonishing assemblage of knowledge, which he has arranged according to his system, in such order, that the elements themselves would have striven in vain to turn him out of his course. If his desire of knowledge went too far, it at least evinces in him an ardent desire to obtain information himself, and to convey it to others: for you never find in him any mark of pride or conceit, of rashness or of intention to deceive. If, nevertheless, he is not to be numbered among the doctors of the church, he at least holds an honorable rank among sublime moralists, and deserves to be instanced as a pattern of virtue and of respect for his Creator."

In truth, from all we have read of this truly great man, he was indeed a pattern of truth, chastity, honor, virtue, and learning. He was cheerful in society, and sought and obtained the com-

panionship of all persons who were either eminent for talent or distinguished for knowledge. As a public functionary, he was upright and just, and while he discharged the duties of his station with great exactness, he neglected nothing but his own advancement.

Having concluded all we have to offer, or rather all that we can make room for, on the life of Swedenborg,* we shall, before we enter upon an ex-

* The following extract from a letter of Swedenborg to his friend the Rev. Mr. Thomas Hartley, M.A., Rector of Winwick in Northamptonshire, who, having read some of his works, sought and obtained his friendship, will throw some additional light on his character. It was written in reply to one Mr. Hartley had addressed to him, requesting that he would leave in his hands some account of himself, his family, and connexions. It is dated London, 1769. "I was born at Stockholm in the year 1689 (8) Jan. 29th. My father's name was Jesper Swedberg, who was bishop of West-Gothland, and a man of celebrity in his time. He was also elected a member of the (English) Society for the Propagation of the Gospel in Foreign Parts, for he had been appointed by King Charles XII., as bishop over the Swedish Churches in Pennsylvania and London. In the year 1710 I began my travels; first going to England, then to Holland, France, and Germany; whence I returned in 1714. In the year 1716, and afterwards, I had many conversations with Charles XII., King of Sweden, who was pleased to bestow on me a large share of his favor, and in that year appointed me Assessor of the Metallic College; in which I continued till the year 1747, when I resigned it; but still retain the salary annexed to it, as an appointment for life. My sole view in this resignation was, that I might be more at liberty to devote myself to that new function to which the Lord hath called me. On my resigning my office, a higher degree of rank was offered me: but this I utterly declined, lest it should be the occasion of inspiring me with pride. In 1719 I was ennobled by Queen Ulrica Eleonora, and named *Swedenborg*; from which time I have taken my seat with the nobles of the equestrian order in the Triennial Assemblages of the States of the Realm. I am a fellow, by invitation, of the Royal Academy of Sciences at Stockholm; but I have never sought admission into any other literary society, as I belong to an Angelic Society, wherein things relating to heaven and the soul are the only subjects of discourse and entertainment; whereas the things which occupy the attention of our literary societies are such as relate to the world and the body. In the year 1734, I published, at Leipsic, the *Regnum Minerale*, in three vols. folio; and in 1738, I took a journey into Italy, and stayed a year at Venice and Rome. With respect to my family connexions, I had four sisters. One of them was married to Eric Benzelius, afterwards promoted to the Archbishoprick of Upsal: and thus I became related to the two succeeding Archbishops of that see, both named Benzelius, and younger brothers of the former. My second sister was married to Lars Benzelstierna, who was promoted to a provincial government. But all these are dead; however, two bishops who are related to me are still living; one of them, named Filenus, is Bishop of East-Gothland, and now officiates as President of the Ecclesiastical Order in the Diet at Stockholm, in the room of the Archbishop, who is infirm; he married my sister's daughter; the other named Benzelstierna, is Bishop of Westermania and Dalecarlia; he is the son of my second sister. Not to mention others of my relations who enjoy stations of dignity. I live, besides, on terms of familiarity and friendship with all the bishops of my country, [the Italics are ours] who are ten in number; as also with the sixteen senators, and the rest of the nobility; for they know I am in fellowship with angels. The king and queen also, and the three princes their sons, show me much favor. I was once invited by the king and queen to dine at their table—an honor which is in general granted only to the nobility of the highest rank; and, likewise, since, with the hereditary prince. They all wished for my return home; so far am I from being in danger of persecution in my own country, as you seem to apprehend, and so kindly wish to provide against; and should anything of the kind befall me elsewhere it cannot hurt me. But I regard all I have mentioned as matters of respectively little moment; for, what far exceeds them, I have been called to a holy office by the Lord himself, who most graciously mani-

amination of his "Animal Kingdom," condense what his followers propound, as the theological doctrines advocated by him, premising that what Evans had said in his History of all Religions, of his peculiar tenets, is not admitted to be correct by those who have studied, and consequently are best able to expound, his theological system; and so far as we can understand, from a perusal of portions of the "Arcana Celestia," the "New Jerusalem," and "Heaven and Hell," we think they are right. However, it must be admitted that the language and the peculiar phraseology in which most, if not all Swedenborg's arguments and reasonings are clothed, present almost insurmountable barriers to the irregular assaults of the mere passive inquirer. Some passages require to be read five, six, and even seven times, and every member of the sentence dissected, criticised, examined, reëxamined, microscoped, and recorded as we proceed, ere we can understand his meaning; but when we have gone through this initial study and almost eleusinian sacrifice and application, we are indeed repaid for all our labor and pains. And here, though perhaps the remark might be delayed until we come to speak of Mr. Wilkinson's translation, we cannot refrain from recording an opinion that it would have tended much more to the popularizing of the works of Swedenborg, had the translator avoided the error into which we believe Swedenborg to have inadvertently fallen, of conveying his ideas to us in such mystic hieroglyphic as to require the aid of a key or dictionary to elucidate. It is true Mr. Wilkinson (p. xiv. of the Preface) promises "a Glossary of those terms in parts II. and III.," but in the mean time part I. is left to fight its way as best it can with a public always impatient of labor, and ever emulous of ease. Mr. Wilkinson should have remembered the old adage—while the grass grows, the steed starves—*inter cæsa et porrecta*.

M. Sandel, who seems to have barely looked into Swedenborg's theological works, and betrays little fondness for them, if he does not evince a decided feeling against them, says,—

"He explains in them, according to the laws of the system he had adopted, both things visible and invisible; from the former he draws conclusions respecting the latter: he represents to himself, in conformity with the world in which we live, another and entirely spiritual world, in which, as in this, he admits of degrees of perfection, and increase without end in the faculties of the inhabitants, a similarity and agreement of tastes and occupations, of conveniences and inconveniences, of pleasures and of pains. Strongly impressed with these ideas, he endeavored, in examining the fested himself to me, his servant, in the year 1743; when he opened my sight to the view of the spiritual world, and granted me the privileges of conversing with spirits and angels, which I enjoy to this day. From that time I began to print and publish various *arcana* that have been seen by me, or revealed to me; as respecting heaven and hell, the state of man after death, the true worship of God, the spiritual sense of the word; with many other most important matters conducive to salvation and true wisdom. The only reason of my latter journeys to foreign countries, has been the desire of being useful, by making known the *arcana* entrusted to me. As to the world's wealth, I have what is sufficient, and more I neither seek nor wish for. [This remark is an answer to an offer by Mr. Hartley, to supply him with money, should he have occasion for it.—Ed. "Documents."] Your letter has drawn the mention of these things from me, with a view, as you suggest, that any ill-grounded prejudices may be removed, &c., &c. Eman. Swedenborg."

Holy Scriptures, to combine them with his philosophical principles. Nevertheless, in describing spiritual things, he has not been able to avoid the ideas inseparable from material existence."

The following is the statement of the editors of the "Documents," and we presume they, as having studied the theological system of Swedenborg deeply, cautiously, and thoroughly, are more to be relied upon than M. Sandel; who says, indeed, his opinion is formed "from a slight inspection;" which party however is right, we will not take upon ourself to determine, though we incline to the editors of the "Documents." They state that Swedenborg did not publish what he had written respecting the spiritual world, as *things concluded* from what is visible, or the natural world, respecting what is invisible, or the spiritual world, but he published them as "*matters of fact from what he heard and saw in the Spiritual World.*" His assertion, say they, was, that the Lord had mercifully opened the *sight of his Spirit*, so that he could in a state of perfect wakefulness, associate with spirits and angels, and thus from experience he became acquainted with the spiritual and its relation to the natural world, and also with the state of men after death. Every man, he states, has in his material body a spiritual body, for "there is a natural body, and there is a spiritual body," the organs of which are the only ground of all sensation "since the material body in itself has no sensation, but is only the instrument by which the spirit, that is the man himself, has communication with the material world."

In the spiritual world, the spiritual body sees, hears, feels, and enjoys the use of all the corporeal senses, but in a more exalted degree than in the material body. These senses (so we take the spiritual organs to mean) can be so refined, (or "opened," as say the editors,) when it pleases the Almighty, that men, even without passing through the gates of death, may be made to communicate with spirits and angels, or beings who have already (as it appears to us) experienced the ordeal of the material life, and see the things of the spiritual world, which are not *material*, but *substantial*.

"Thus, [says Tafel,] the spiritual sight of the prophets and apostles was opened when they saw in vision the things which they describe, as Zechariah, Ezekiel, Daniel, &c., and especially John in the Apocalypse. All the objects they saw were not material, but spiritual, for there are *spiritual substances* as well as *material*. But spiritual objects are not like material objects subject to mechanical and chemical laws, nor to the conditions of time and space, but they are subject to pure spiritual laws, and precisely correspond to the states of the spiritual inhabitants, and thus represent the state of their affections and thoughts of their real life, whether good or evil. What, therefore, Swedenborg describes as *facts* concerning the spiritual world and the states of departed spirits, must not be considered, according to M. Sandel's supposition, as conclusions drawn from visible or material things respecting invisible or spiritual things, but as *realities* perceived in spiritual light by his spiritual senses and communicated to the world to promote the wisdom, happiness, and salvation of mankind." (pp. 28, 29.)

It will be seen here that M. Tafel assumes as *facts* those things which are at any rate to the inquirer only *statements*. It is true that in the concluding sentence, he adds, that "the things

which Swedenborg describes as *facts and realities*, and which he heard and saw in the spiritual world, will be seen, proved, and attested by the celebrated German philosopher, Kant, and others equally worthy of credit, as we proceed further on." But now comes the test—will the testimony of Kant, or even of those "equally worthy of credit," be considered valid evidence and proof of the truth, by those who are to judge and give verdict on the case of the doctrines of Swedenborg? We think not. And here it would be advisable, did space and time permit, to offer some remarks upon the doctrines of Kant, and his writings, since the subtlety of his metaphysical reasonings once made so much noise in Germany: but this would be carrying us quite beyond the bounds of a mensal publication, and depositing us on the confines of that world, to which Jacob Böhmen, and Plotinus, and Porphyry, Luther, Epimenides, Pythagoras, Beaumont, and Prebendary Dennis, according to their own statements, were admitted. Neither have we the hardihood, as mere strollers on the shore of the ocean of knowledge, now and then picking up a pebble, to deny *in toto* those arguments which the admirers of Swedenborg have brought forward to validate the evidence which they tender in support of his claims to transcendental exaltation. Our sole object is *truth and truth only*, and a search for which once instituted, we hold, should be persevered in with the most rigid firmness, and the most uncompromising impartiality.

It is difficult to refuse to receive the extraordinary history of the case, where Swedenborg is represented as conversing with the deceased brother of the queen, (of which more by and by,) or that of the lost receipt, yet they were miracles* worked, as it appears to us, without a commensurate necessity. Johnson, in his "Life of Roscommon," has made the same remark on the relation of a fact by Aubrey, of the vision of his father to Lord Roscommon at the moment of his death. In the case of Lord Lyttleton, which of course is familiar with our readers, there is, however, some cause, some reason; and the same may be alleged of the appearance of Lord Tyrone,† for an inversion of an acknowledged, or perhaps manifestation of a hidden law of nature. But in the case of Swedenborg, there does not appear upon the face of the narrative, at first sight, that necessity, or object, or motive; hence those who are endued with a strong spirit of incredulity will check themselves *in lumine* and dismiss the inquiry. To this proceeding we cannot assent. In the present state of our knowledge we can see no necessity or discover any use for the eruption of the volcano, the rage of the storm, or the horrors of the earthquake, yet there are not those among men who are accustomed to ponder upon the mighty laws and forces of nature, who will come forward and deny their dreadful frequency. It is not, then, from the inutility of a thing that we are to question its existence, or the rarity of an event that we are to deny its occurrence; and, consequently, when a circumstance is related to us by creditable persons as having happened—as a shower of fish for example—we are not acting in the true spirit either of Christianity or philosophy, if we proceed without investigation to deny the relation. Strange as it

may read to those who may not have given that attention to psychology and psychological inquiry which the importance of the subject demands, there are not wanting those, even at the present day, who have seen, or at any rate believe they have seen, visions and revelations, though of a different nature, not inferior to those which Swedenborg—a man of probity and learning—positively assures us he saw in the spiritual world.

We have the honor to be acquainted with a noble lord—an ornament to the senate of which he is a member—who is considered apt in debate, comprehensive in argument, correct in his conclusions as to matters of general moment, and (*we know him to be*) deeply learned, not in the conventional knowledge of classical verbalists, but in the more erudite and recondite sciences of botany, geology, mathematics, and æconomics, who has confessed to the appearance of an apparition, whose errand was only in part fulfilled, and whose advent was scarcely necessary to the end in view. We have again and again conversed with his lordship upon the subject, and he always entertains the same opinion, that the end for which it manifested itself, was scarcely adequate to the means, yet assures us such was the case. In the "Credibility of Swedenborg"* there are some arguments, especially in the first and third part, which are astounding, and require to be read with a rigid determination not to allow catechetical inquiry to assume the province of demonstrative infallibility.

But see to what a length the admission of the reasoning and arguments of the writer would necessarily lead us! Admitted, that Swedenborg was favored with those peculiar revelations, which, collated and enfolded, have been fused into a system of theology, would it not open the door to Kötter, Simon Majus, Labadie, Kuhlman, Lewis, and Caspar Lavater, Increase Mather, William Law, Wanley, Böhmen, *et cum multis aliis*, who would then be entitled to be considered as the founders of new systems of religion, all concurrent it may be in morality and virtue, but deeply divergent in the modes, manners, forms, and ceremonies of outward worship, and in those nice metaphysical and psychological distinctions which make up the sum of the code of any established religion? This is a question which may well be asked, and we think may be replied to very easily. They might have all seen the visions they relate, but it does not follow that they were one and all commissioned to renovate principles, or controvert tenets previously established. If it be conceded that the prophets of old, and the apostles, Peter, Paul, John and others, were favored with visions, who were but ordinary men, chosen for a special purpose, it will be difficult to refuse to admit the claims of those, who, with the exception of these supernatural relations, (which many persons, however, take for indications of mania,) were considered by all who knew them as wise, prudent, upright, just, honorable, learned, and virtuous men. Nor do we see what harm an admission of their relations as realities can do. In all the visions and revelations which have been put forth by persons claiming to be illuminated with a divine grace or light, it is remarkable that not one pretends to be commissioned to do evil. This, alone, is a strong argument in favor of their

* An Essay on the Credibility of Swedenborg, &c., 12mo. London, 1835.

* We use the word "miracle" in the common acceptation.

† *Vide* Accredited Ghost Stories, by J. M. Jarvis, Esq., London, 1823.

pretensions, and should always be kept in mind, when examining critically, relations of preternatural occurrences.*

* Is it not possible that there may be an explanation found in the superior cerebral development of one man over another, and that the organs of the brain may be so refined, strengthened and aculeated, that they may perceive many things which are invisible to others? Does that individual now living at the Mauritius, who perceives ships several hundred miles at sea, not possess a very peculiar property in his organs of vision? This man would have been treated as an impostor if he had not physical proof always at hand to tender in support of his possession of his singular quality. He is pensioned by the British government, and every morning he reports to the government house what number of vessels there are in the offing and when they may be expected, and it is remarkable that he has been never known to report falsely. When the first steamer went to the East, he saw her, it is stated, three hundred miles off, but as may be supposed, was not a little surprised to perceive that she moved nearly without sails, and had four masts, one of which appeared to be on fire, as it was smoking! On reporting the appearance of this strange vessel, it was immediately concluded that he had lost his extraordinary power of vision, and that he had invented the tale to excite curiosity. The event, however, only served to confirm the fact of his wonderful faculty. It was still more remarkable, as no intimation whatever had reached the island that a steamer would start for India. Reasoning therefore on this principle, that one man may have his cerebral organization more perfect than another, may we not concede to a human being the possession of a faculty of which we ourselves have no cognizance? Or may not some principle in an individual, when meeting with another opposed to or agreeing with it, develop a third which shall be a visible entity as the former two were invisible entities? In the absence of definite terms we shall illustrate our meaning thus—Lime-water, when recently made, and kept from contact with atmospheric air, is clear, limpid, and diaphanous—or at least nearly so—while carbonic acid gas is altogether invisible. But if we bring them in contact, immediately we have a change in the appearance of the liquor, which becomes cloudy and subsequently turbid. This may be a clumsy mode of explaining our meaning, but we really cannot help it, as on psychological questions language is unsettled, and the qualities of subjects have not been defined. It is remarkable that persons who have never heard of psychological argument, or indeed of anything approaching to the doctrine of an immaterial substance coexistent with the body, have affirmed the same facts as Swedenborg. The writer of this article remembers a negro girl who was distinguished for nothing but this property, faculty, or exaltation of the cerebral organs, who in the middle of the day, and at other times also, he believes, would cry, "Look at them! See how they run! There they are! the spirits!"—Nor did these visions, so far as we could learn, ever interfere directly or indirectly with her work; nor was she ill, nor was she treated as one laboring under disease. She grew up and had children, and we believe no longer saw these bodies. In no instance did she claim any merit or even (from all we could learn) think but that every one was endowed with the same faculty. Now this relation may, or may not be true—it is nevertheless a singular circumstance that an unlettered black should describe the appearance of spiritual substances very much in the style and language of an European. The phenomena may be explained by admitting the hypothesis of Ferriar and Hilbert, or the reasoning of Nicolai, to say nothing of the recent arguments of Lawrence, of the cerebral materialism of Drs. Elliotson and Engledue. *But who is prepared to admit them? Certainly not the writer of this article.* For though we entertain the highest respect for these authors, especially Drs. Elliotson and Engledue, we cannot subscribe to their doctrines. We believe them to be based on gratuitous assumptions, and supposititious facts. On any view of the question, however, it is obscured by doubt, entangled by confusion, obstructed by difficulty, and bounded by the finite powers of the corporeal organs. Liebig has even trenchoned upon materialism, but finding himself likely to be more bewildered in that faith than in the doctrine of psychology, slips out of the dilemma by confessing that "the chemist can never make a single leaf." It is remarkable that while doctors admit

It is some two-and-twenty years since a clergyman of the Church of England—a man of piety, probity, and learning—Prebendary Dennis, published a curious work, detailing very minutely the singular vision which occurred to him, an account of which we think will not be unacceptable to the reader. We may premise that the book* is written in a very vivid, terse, fervid style; is replete with many noble and original thoughts, though expressed in rather tumid language; and is dedicated (ironically) to Mr. Lawrence, "Surgeon and Apostle of Materialism." The Prebendary is an unflinching advocate of the Church of England, and Puritans, Dissenters, and Catholics, are treated (at least metaphorically) with very little less ceremony than was Marsyas by Apollo. He cannot be accused of having any leaning towards that portion of the Catholic religion which inculcates the belief in the occasional illumination by the Divine Spirit of certain chosen persons for especial purposes. Yet, he testifies to the truth of such tenets in his own person. We give the relation in the prebendary's own language, who speaks in the third person.

"Travelling to Pixton, the seat of Earl Carnarvon, a distance of twenty-five miles, to visit an intimate friend, tutor to Lord Porchester, Mr. S. Nosworthy, clerk, now rector of Brushford, he

what to the unassisted mind is more difficult of belief than that of a spiritual substance coexistent with the body, they deny, if not in direct terms at any rate inferentially, the existence of spirit. We may except Müller however from the charge, whose opinion would not only seem to overturn all chemical views of *life*, but would even establish an essential principle, or essence, or force, which theologians would have no hesitation in declaring was THE SOUL. This is what he says: "In mineral substances the elements are always combined in a binary manner. They are never observed to combine three or four together, so as to form a compound in which each element is equally united with all the others. This however is universally the case in organic bodies. Oxygen, hydrogen, carbon, and nitrogen, the same elements which by binary combination formed inorganic substances, unite together each with all the others, and form the peculiar proximate principles of organic beings. These compounds are termed ternary, or quaternary, according to the number of elements composing them. Although they may be by analysis reduced to their ultimate elements, they cannot be regenerated by any chemical process. Another essential distinction pointed out by Berzelius is, that in organic products, the combining proportions of their elements do not observe a simple arithmetical ratio." (*Müller's Physiology*, pp. 3-4, 1833.) Now this "vital force," or "vitality," or "vital principle," or whatever else it may be called by chemists and physiologists, we have no hesitation in saying is the *Soul* or *Spirit*, which, overcoming chemical as well as organic laws, develops by the aid of the material organs those phenomena which we call "human life," and which manifest more or less of divine origin, in proportion to the purity of the elementary bodies or proximate principles of matter, through which, by a law of organization, the soul or spirit is compelled to act. Upon this subject few men have written better or more to the purpose than Dr. Martyn Paine of New York. (See an *Examination of a Review, contained in the British and Foreign Medical Review, &c.* By Martyn Paine, M. D., New York, 1841.) It is to be regretted that the pamphlet referred to is not republished in England, as besides the exposure of the plagiarism of the reviewer, Dr. Paine shows that his reasoning tends directly to the worst species of materialism. We must apologize for this note, which has extended to an almost inconvenient length, but we were desirous that no misapprehension of our meaning should occur, and consequently have, at risk of prolixity, labored to prevent it.

* SUBVERSION OF MATERIALISM, by Credible Attestation of Supernatural Occurrences, &c. &c. By J. Dennis, B.C.L., Prebendary of the Royal Collegiate Church of Exeter Castle. 12mo. 1826. Bath and London.

(the author) had the prospect of a tedious journey, through reluctance to distress by speed his horse, materially injured in the foot. With a mind free from care:—no human being commanding more self-possession, in dismissal of painful reflection on experience of injurious or insulting treatment, through firm persuasion, that all things work together for good to them who love God;—with a mind tranquil, and panting for a partial revival of those attic days, so often spent in literary discussion with a most accomplished scholar and confidential associate, who sought mental enjoyment for the livelong hours of itinerant solitude. Precluded from daily solace of visiting the courts of the Lord's house, succedaneum was supplied in the duty enjoined on the clergy, both by ancient and modern laws, secret solemnization of liturgical rites, in default of public worship. Without articulation, he raised his heart to heaven, mentally and cordially offering up the following prayer: 'Lord, let me feel myself in thy more immediate presence; assist, I pray thee, and accept of my services; let thy Holy Spirit keep my infirmities, disposing my heart to seriousness, attention, and devotion, to the honor of thy holy name, and the benefit of my soul; through Jesus Christ our Lord.' He strictly adhered to the mode of attaining acceptable prayers, recommended by that pious man of active occupation, Mr. James Bonnel, Accountant General of Ireland at the Revolution. Any passing object having incidentally diverted attention, he returned to the point of incipient wandering. Thus every word silently repeated, was ultimately accompanied with correspondent thought and desire. Be it known to every class of sectarian will-worshippers, that a precomposed form of prayer, thus used, came up for a memorial before God, as was incontrovertibly demonstrated by the signal event. Toward conclusion of the morning service, with heart and mind intensely raised towards heaven, he distinctly descried, bursting from the eastern quarter of the atmosphere, a sudden blaze of light of transcendent brilliancy, infinitely surpassing the meridian radiance of the sun, being of the brightest possible degree of whiteness, transmitted in progress, neither in straight lines, as solar light, nor in angular zigzag direction, as lightning, but in curvilinear undulating direction, somewhat approaching the incurvated line described by a dove, descending from an exalted point of altitude. In lapse of about a minute, this most brilliant blaze so completely enveloped his person, that, having his eyes open, he could not see the animal on which he rode, while continually feeling his progressive motion unimpeded, from commencement to termination of the vision. Thus surrounded by a transcendent light, he distinctly saw a still more brilliant irradiation also transmitted in undulating direction from the east, and resting in the atmosphere in a perpendicular direction over his head. At this acme of the supernatural phenomenon, he distinctly heard pronounced by an audible articulate voice in that part of the heavens, directly above the spot where he was proceeding, the following words: 'The discipline of the church will be restored through you, &c.' The irradiation of superior brilliancy receding to the East, that of comparatively inferior splendor continued to envelope him, without intermission. The superior irradiation returning, he then with equal distinctness heard the following words: 'Miss

Shore will marry you.* Again reading and returning as before, he heard the following words: 'you will recover your health, by observing the fasts of the church.' Then the light of prime splendor receding, the light of secondary brightness subsequently receded. Immediately subsided the corporeal sensation of exquisite freedom from atmospheric pressure, with genial refreshment, defying description, from substitution of celestial ether. Independently of the mental solace of divine communication; antecedently, intermediately, and subsequently, pending envelopment in the supernatural cloud, he enjoyed sensible foretaste of heaven upon earth. * * * Toward its conclusion, he met in an open carriage a retired, well-known barrister, driving with his wife, whom he accosted as usual, not venturing to excite habitual propensity to coarse jocularity, by remotest allusion to the recent occurrence." (pp. 55—58.

This was not the only vision seen by the prebendary, but we cannot make room for them, and must leave this signal account of a still more signal intervention of Providence, or, according to the doctrine of the cerebral philosophy, this exalted aberration of the intellectual organs, in the hands of the reader, and proceed to relate the cases of Swedenborg's alleged conversation with the dead—a narrative that must be read even by the most infidel of reasoners with something akin to awe, however that feeling may be subsequently submerged in the alarm of pride, or laughed off in the confidence of philosophy. Here we have recourse to Mr. Noble's *Appeal*,† and we abridge the account which he gives of "The Queen of Sweden's Testimony, concerning Swedenborg's Intercourse with the Spiritual World." Mr. Noble gives the account in the queen's own words, as recorded "by an author who cannot be suspected of any partiality in favor of Swedenborg; I mean M. Dieudonné Thiebault, a French savant of the school of Voltaire, and professor of the *Belles Lettres* in the Royal Academy of Berlin." Thiebault is known in England by a work on Frederick the Great,‡ and consequently, a perusal of that volume will enable the reader to judge how far Mr. Noble is justified in referring him to the school, *that was*, of Voltaire. Thiebault, it must be premised, represents the queen, Louisa Ulrica, as being like her brother, a professed *esprit fort* even to the avowal of atheism; consequently it cannot be supposed that she could feel any desire to exalt the theology of Swedenborg in public estimation, though her innate nobility would not permit her to deny the truth of the extraordinary fact to which she was a party. We now quote Thiebault's own words, not being solicitous of the responsibility of a statement which, however founded on fact, is still of that nature, that no one should willingly put forth his own authority in support of it, when he can easily bring forward the original author.

"I know not on what occasion it was, that conversing one day with the queen on the subject of the celebrated visionary Swedenborg we (the members of the academy) expressed a desire, particu-

* This young lady subsequently became his wife.

† *Appeal on behalf of the Doctrines of the New Jerusalem Church.* By S. Noble.

‡ *Original Anecdotes of Frederick the Great, King of Prussia.* London. 1805. The work was originally written in French.

larly M. Merian and myself, to know what opinion was entertained of him in Sweden. I, on my part, related what had been told me respecting him by Chamberlain d'Hamon, who was still alive, and who had been ambassador from Prussia both to Holland and France. It was that his brother-in-law (the Count de Marteville, Ambassador from Holland to Stockholm,) having died suddenly, a shopkeeper demanded of his widow the payment of a bill for some articles of drapery which she remembered had been paid in her husband's lifetime: that the widow not being able to find the shopkeeper's receipt, had been advised to consult with Swedenborg, who she was told could converse with the dead whenever he pleased; that she accordingly adopted his advice, though she did so less from credulity than curiosity; and at the end of a few days Swedenborg informed her, that her deceased husband had taken the shopkeeper's receipt for the money on such a day and such an hour, as he was reading such an article in *Bayle's Dictionary*, in his cabinet; and that his attention being called immediately afterwards in some other concern, he put the receipt into the book to mark the place at which he left off; where in fact it was found at the page described. The queen replied, that though she was but little disposed to believe in such seeming miracles, she nevertheless had been willing to put the power of M. Swedenborg, with whom she was acquainted, to the proof: that she was previously acquainted with the anecdote I had related, and it was one of those that had most excited her astonishment, though she had never taken the pains to ascertain the truth of it; but that M. Swedenborg having come one evening to her court, she had taken him aside and begged him to inform himself of her deceased brother, the Prince Royal of Prussia, what he had said to her at the moment of her taking leave of him for the court of Stockholm. She added, that what she had said was of a nature to render it impossible that the prince could have repeated it to any one, nor had it ever escaped her own lips: that some days after Swedenborg returned when she was seated at cards, and requested she would grant him a private audience; to which she replied he might communicate what he had to say before the company; but Swedenborg assured her he could not disclose his errand in the presence of witnesses; that in consequence of this intimation the queen became agitated, gave her cards to another lady, and requested M. de Schwerin (who also was present when she related the story to us) to accompany her—that they accordingly went together into another apartment, where she posted M. Schwerin at the door and advanced towards the farthest extremity of it with Swedenborg; who said to her, 'You took, madam, your leave of the Prince of Prussia your late august brother, at Charlottenburg, on such a day and at such an hour in the afternoon; as you were passing afterwards through the long gallery in the castle of Charlottenburg, you met him again; he then took you by the hand and led you to such a window, where you could not be overheard, and then said to you these words:—The queen did not repeat the words, but she protested to us they were the very same her brother had pronounced, and that she retained the most perfect recollection of them. She added that she nearly fainted at the shock she experienced: and she called on M. de Schwerin to answer for the truth of what she had said, who in his laconic style contented himself with saying,

'All you have said, madam, is perfectly true, at least as far as I am concerned.' I ought to add, that though the queen laid great stress on the truth of her recital, she professed herself at the same time incredulous to Swedenborg's supposed conferences with the dead. 'A thousand events,' said she, 'appear inexplicable and supernatural to us who know only the immediate consequences of them; and men of quick parts, who are never so well pleased as when they exhibit something wonderful, take an advantage of this to gain an extraordinary reputation. M. Swedenborg was a man of learning and of some talent in this way; but I cannot imagine by what means he obtained the knowledge of what had been communicated to no one. However, I have no faith in his having had a conference with my brother.'"

This is Thiebault's account; and in any manner that the means of obtaining this information by Swedenborg of what had been known but to *two* persons, and one of them dead, may be explained, it cannot affect the *fact*; consequently the admirers of Swedenborg are as much entitled to insist that the faculty said to have been possessed by him was the true medium by which he acquired his knowledge, as their opponents have to invent or suppose another channel, which they have not however ventured to name. We have no hesitation, therefore, in saying, startling as we admit the affirmation to be, that the Swedenborgians have the better of the argument. There is, indeed, one other supposition, which is, that Swedenborg was a clairvoyant, or that he lived in a highly exalted or mesmerized sphere, (we can find no other word to explain what we mean,) which in some respects modifies the argument, or rather shifts it from that of a psychological to a physiological discussion. But all men are not agreed as to the existence of such a property of matter or spirit as mesmerism—yet they are acquainted with attraction, cohesion, gravitation, magnetism, and the influence of the invisible rays of light (or caloric) upon material bodies—and consequently this new explication will not be generally admitted. In the absence, then, of all other testimony or explanation of the means by which the information was obtained, we must be content with what Swedenborg himself asserts, because his mode of life, his pursuits, and his moral character entitle him to belief. This reasoning may not be considered conclusive by many, but that we cannot help. We are not of the church of the New Jerusalem, neither do we embrace its peculiar tenets; nor do we say of ourself that the knowledge of what the brother said to the sister at parting, was obtained through the instrumentality of the dead, but we say that in the absence of all other explanations (and none others are shown to exist) we must receive Swedenborg's, as on the most rigid scrutiny we can discover no motive for deception.

The story is also related by Baron de Grimm,* who afterwards concludes thus:—"The fact is confirmed by authorities so respectable, that it is impossible to deny it: *but the question is how to believe it!*" This surely is at least writing oneself down "an ass." What else short of immediate Divine interposition can we have to substantiate a fact, besides "authorities so respectable, that it is impossible to deny their affirmation;" and yet, when we have heard this—all, be it remembered,

* *Vide* Memoirs Hist. Lit. et Anecdotiques, tirés de la Correspondance adressée au duc de Saxe Gotha, par le Baron de Grimm. Tom. ii., p. 56, ed. London, 1813.

that human nature can produce in support of the assertion, we turn round and positively verify the remark, "and they would not believe, though one rose from the dead!" With such persons it is impossible to argue. They must either deny the proposition, and prove the *vetus testimonium* corrupt, or they must admit the statement. In this position we shall leave them.

Of other extraordinary relations of Swedenborg we have nothing to say. They are of a similar nature and are as well attested. We, therefore, hasten to consider the work now before us, namely, "The Animal Kingdom,"*—first, however, drawing attention to the many singular anticipations of the discoveries of modern philosophers.

Of the discoveries which Swedenborg made in chemistry, astronomy, and anatomy, it is impossible to speak in language too panegyric. According to the Marquis de Thomé †, who addressed some remarks to the commissioners appointed to inquire into the merits of *animal magnetism* by the king of France, Swedenborg was the first who offered a theory on the magnet. The words of the Marquis are :—

"In the report of the commissioners appointed by the king for the examination of animal magnetism, these gentlemen have affirmed that there does not exist any theory of the magnet. This assertion has occasioned many remonstrances; and I shall here make one, and, as I think, the most just of any, in favor of an illustrious man of learning, some years since deceased. Three folio volumes were printed at Dresden and Leipsic in 1734, under the following title: *Emanuelis Swedenborgii Opera Philosophica et Mineralia*. The first of these volumes is entirely devoted to a sublime theory of the formation of the world, founded on that of the magnetic element; the existence, form, and mechanism of which are demonstrated by the author from experience, geometry, and the most solid reasoning founded on these two bases."

The two other volumes, as not bearing upon the subject in question, the marquis dismisses, but not until he has made the following remark :— "that in the whole of the work, there is such an

* As it is possible to conceive some of our readers may be desirous of examining into the testimonies respecting the visions and revelations of Swedenborg, and of comparing them with those which have been adduced in support of others, we subjoin a list of those works which we have consulted either directly or indirectly as bearing on the question—some especially in reference to Swedenborg, others only as tending to elucidate the inquiry: *Tygh's Life of William Law*, 8vo; *Mather's Remarkable Providences*, also his *Life* by his Son, and the latter's *History of New England and Wonders of the Invisible World*; *Jennings' Life of Cotton Mather*; *Kotter's Lux in Tenebris*, Amsterdam, 1657; *Hubbert's Theory of Apparitions*; *Ferriar's History towards a Theory of Apparitions*; *Lavater De Spectris*; *Kuhlman's Prodomus quinquevni Mirabilis*; *Connor's Evangelium Medici*; *Jung Stilling's Theory of Pneumatology*, by Jackson; *Accredited Ghost-Stories*, by Jarvis; *Signs Before Death*, by Horace Welby; *Wesley's Journal*; *Colton's Account of the Sampford Ghost*; *Aubrey's Miscellanies*; *Beaumont's Treatise on Apparitions*; *Glanville's Sadducismus Triumphatus*; *Wanley's Wonders*; *Ellys' Remarks on Hume's Essay on Miracles*; *Newman's Essay on the Miracles of the Middle Ages*; *The Psychological Magazine*; *Intellectual Repository* (*passim*); *The Zoiist*; &c., &c., &c.

† On an assertion of the Commissioners appointed by the King of France, for the examination of animal magnetism, by the Marquis of Thomé, dated Paris, Aug. 4th, 1786. This letter will be found in *Tafel's Documents concerning Swedenborg*, and in *The Intellectual Repository* for 1815, p. 191.

abundance of new truths, and of physical, mathematical, astronomical, mechanical, chemical, and mineralogical knowledge, as would be more than sufficient to establish the reputation of several different writers." He further says, that the most celebrated men have not disdained to draw materials from it, to assist them in their labors; and that, "some have had the weakness to dress themselves in the feathers of the peacock, without acknowledging where they obtained them." He informs us, that after reading the paragraph in the first volume, p. 387, entitled *De Chao Universali Solis et Planetarum deque separationem ejus in Planetos et Satellites*; and that at page 438, *De Progressione Telluris a sole ad Orbitam*, it will be seen, how much Buffon was mistaken (was not the error voluntary!) in saying in his Discourse on the Formation of the Planets, that nothing had ever been written on the subject. The Marquis farther informs us, that a cursory perusal of this first volume will be sufficient to repress any astonishment we might be inclined to express at the experiments of M. Lavoisier—Swedenborg having previously shown; that earth and water are not to be regarded as elements, nor elements as simple substances. The numerous and curious experiments of Camus are then alluded to in the following language :—

"I would forbear to add that M. Camus, who has performed such surprising things with the magnet before our eyes, admits that he has derived from this author almost all the knowledge that he has exhibited on this subject, and, in short, without having studied him, our acquaintance with magnetism must be very imperfect—if the commissioners appointed by his majesty to examine animal magnetism, had not affirmed, that there as yet exists no theory of the magnet."*

It would appear, indeed, from the Marquis' showing, that the first volume alone of this great work of Swedenborg is one of the most complete and profound ever published. Swedenborg did not deal in generalities. He argued on geometrical principles, remarking (as de Thomé informs us) at p. 184 of his first vol.—"Unless our principles be geometrically and mechanically connected with experience, they are mere hallucinations and idle dreams." De Thomé, a little after, says, that the theory of Swedenborg incontestably proves the existence of the magnetic element; that it establishes, that the particles of this element being spherical, the tendency of their motion, in consequence of this form, is either spiral or vertical, or circular; that as each of these motions require a centre, whenever the particles meet with a body, which by the regularity of the pores, and the configuration and position of its parts, is adapted to their motion, they avail themselves of it and form around it a magnetic vortex; that, consequently, every body that has such pores and such a configuration and position of its parts may become the centre of such a vortex; that if this body possesses an activity of its own, if its parts are flexible, and if its motion is similar to that of the particles, it will be so much the more disposed to admit them, &c., &c. Whence, says Thomé, it

* It will be gathered from this what was or is the real value of the report of the commissioners appointed by the king to inquire into the facts connected with animal magnetism. Jussieu's reclamation ought to be reprinted, if it be merely to show how opposed physicians have generally been to all advancements in the science of medicine.

follows, that magnetical substances are such merely by virtue of the element whose existence Swedenborg has demonstrated, and thus that the magnetism of bodies depends, not on their substance, but on their form; a truth which is hinted at by the learned Alstedius in his excellent Encyclopædia, printed at Lyons, in 1649; to which, drawing a comparison between electricity and magnetism, he says, *Motiones electricæ a materia, magneticæ vero a forma pendent.**

We must now take leave of the marquis, to whom we have been much indebted for this resumé of Swedenborg's theory of magnetism, and refer to some other discoveries, which were undoubtedly Swedenborg's. And, first, of the *Foramen* of Monro. The first person who publicly claimed the discovery of this passage or communication between the right and left, or two lateral ventricles of the cerebrum, was Dr. Monro, the second of Edinburgh. For a long time many anatomists denied its existence, and a story is told, we think of one of the Bells, who, when demonstrating the cerebrum to his pupils, used to push the blow-pipe through the parietes of the ventricles, and exclaim, "This is the foramen of Monro!" However, it was at last conceded that there was a foramen, but that it was known before Monro's time! yet we do not remember to whom the honor of the discovery was generally attributed, but certainly not to Swedenborg. This great man, however, was not always to be denied the credit which was due to him, for a writer in the *Intellectual Repository* for 1824, page 170, took up the cudgels, and proved Swedenborg's title to the discovery, though up to this date we do not remember any treatise on the brain, in which the author even alludes to Swedenborg. Monro's first intimation in public of his discovery, was on the 13th of December, 1764, when he read a paper to the *Phil. Soc.* of Edinburgh on the subject; but in his work, entitled "*Observations on the Structure and Functions of the Nervous System,*" he says, that he demonstrated the *foramen* to his pupils as early as the year 1753. Monro allows that a communication was known to exist between these two ventricles and the third, long prior to his time; but he shows that it was never demonstrated or delineated in the manner he had done, nor in any way that could

* Mr. Faraday, in the first Friday Evening Lecture of this season at the Royal Institution, touched very closely upon the opinion of Alstedius. See the Lecture referred to. The magnetic theory of Swedenborg receives additional assistance, if not confirmation, in father Boscovich's Theory of Matter—if that learned Jesuit had not seen Swedenborg's *Opera Philosophica et Mineralia*, which was published in 1731. It is likely he had, for his *Theoria Philosophia Naturalis reducula ad unicam legem virtum in Natura existentium*, was not published till 24 years after, namely in 1758. How far Swedenborg might have been indebted to Alstedius we will not pretend to determine, as we have not the means of comparing the Encyclopædia and the *Opera Philosophica* together, but it is more than probable that he was acquainted with the contents of an encyclopædia that was at that period and even subsequently a work of great authority. With regard to the theory of Boscovich, which is so strongly opposed to Dalton's, it was, that matter consists of mere mathematical points endowed with attraction and repulsion without extension, so that it resolves matter into mere force or powers of attraction and repulsion. This strongly reminds one of the general *note* of reasoning in all Swedenborg's works, at least those that we have consulted. However, if not a complete resemblance, a very great similarity will be traced between the two modes of putting the theory. Biot, Ampère, Humboldt, Poisson, Barlow, and others have only followed up what Swedenborg pointed out. See Somerville's *Connexion of the Physical Sciences*, 1835.

convey any precise idea concerning it—"much less was implied the existence of the foramen." The channel of communication, which was admitted by the anatomists, seemed to be referred to the posterior, or back part of the lateral ventricles; whilst the foramen Monro described, is situated at the anterior or front part of the ventricle. Now, says the writer in the *Repository*, in the "*Regnum Animale of Swedenborg,*" p. 207, the following striking observation occurs:—"Foramina communicantia in cerebro vocantur anus et vulva præter meatum seu emissarium lymphæ, quibus, ventriculi laterales inter se, et cum tertio, communicant,"—which may be thus translated: "The communicating foramina in the cerebrum are called anus and vulva, beside the passage or emissary canal of the lymph; by these the lateral ventricles communicate with each other, and with the third ventricle." This work was printed in 1744, or nine years prior to the earliest notice by Dr. Monro, of the foramen in question! The notion of the brain also, the first description of which is attributed to John Daniel Schlichting, by Blumenbach in his *Inst. Physiol.* 1787, section 201, was first noticed by Swedenborg. Blumenbach refers to Schlichting's *Commecc. Litter.*, Nov., 1744, p. 409. But the discovery seems due to Swedenborg, as he fully described it in the "*Economia Regni Animalis,*" 1740, Nos. 349 and 458, which was published before Schlichting wrote. This was noticed in the "*Monthly Magazine*" for May, 1841, pp. 448, 460. The discovery amounted to this, that when the lungs shrink or empty themselves in expiration, the brain rises; but when they swell or expand themselves in inspiration, the brain sinks. The writer in the "*Monthly Magazine*" says—

"Another discovery of Dr. Wilson,* concerning the vacuum which takes place when the blood is expelled from the contracted cavities, into which vacuum, according to the common laws of derivation, the neighboring blood must rush, being prevented, by means of the valves, from regurgitating—is due to Swedenborg."

In the "*Economia Regni Animalis,*" Swedenborg also gives a mechanical and geometrical analysis of the globules of the blood, from which he derives all the tissues of the body—

"Here [says the same author] he also commences to treat of motions of the human body; a subject of which indeed he may be considered the discoverer. He demonstrates that the brain has a respiratory motion, a rising and falling synchronous with the inspirations and expirations of the lungs, by means of which falling the nervous fluid (*fluidum Spirituosum*) is propelled all over the system, while the expansion of the brain draws the same fluid from the blood (of which it is the life) through the capillaries of the carotids, into the cortical substance (*corcula cerebri*) and so back into the nervous circulation. *Set the brain in motion* (says Swedenborg significantly) *and you will see the use of all its parts.* This motion generates the motions of the lungs, which react upon those of the brain and serve as a subsidiary and external attractive cause of the circulation of the nervous fluid, of which the motions of the brain serve as the internal cause. Nor is respiration confined to the lungs, but by their means as well as by the brain, is introduced into all the viscera; the whole

* *An Inquiry into the Moving Powers employed in the Circulation of the Blood.* See also Dr. Young's Croonian Lecture in the *Phil. Trans.* for 1809.

being in a state of alternate swell and subsidence; which constitutes their life and activity, and excites them perpetually into the performance of their functions. Thus, with Swedenborg, definite structure has definite function; and definite function is nothing more than definite motion; *Qualis determinatio substantiarum, talis accidentium et motuum, qui substantias, sicut stratos ponticulos percurrunt.* Every fibre has its own fluxion."

The same writer subsequently claims for him the "whole doctrine" of the atomic theory with much show of truth, and next alludes to the composition of water, which Swedenborg laid down geometrically, stating the chemical equivalents of its components to be of the values of 8 and 1, always calling water, which is the formula of the present day, 9. These are very striking proofs of the wonderful genius and expansive mind of Swedenborg. But if it was said of Goldsmith, by Johnson in his epitaph, that he left no subject of human learning untouched, and never touched any subject that he did not adorn, how much more applicable is the sentiment to the illustrious Swede! We have seen that in philosophy, mineralogy, magnetism, anatomy, physiology, algebra, ethics, theology, and geometry, he excelled all other authors of his age, we have now to view him in the light of an astronomer.

"Herschel discovered first in the year 1781, a seventh planet; but Swedenborg, so early as 1745, in his work on the *Worship and Love of God*, § 11, speaks of seven primary planets; he even mentions seven planets in his *Principia Rerum Naturalium*, published in 1734."

We have at length, we think, placed such acts of Swedenborg's wonderful powers of mind before the reader that we can hardly suppose that he now entertains the same opinion of that great man as when he commenced the perusal of this article. He can surely no longer subscribe to the foolish and wicked story of his madness—invented by one *Methusius*, a Lutheran minister, who afterwards went mad himself (see "*Documents*," p. 145, *et ante et postea*) or credit the report of his being a visionary. Visionaries do not deal in geometry, and algebra, and mathematics, nor do they make great discoveries in the brain. Proceed we now therefore to Mr. Wilkinson's translation.

This volume consists of monographs by Swedenborg, upon the tongue, the lips, mouth, palate, and salivary glands; the pharynx, œsophagus, and their glands; the stomach and its orifices; the intestines; the mesentery and the lacteals; the thoracic duct and the lymphatics; the glands generally; the liver and the gall bladder; the pancreas; the spleen; the omentum; the succenturiate kidneys; the kidneys and the ureters; the urinary bladder; the peritonæum; and as the author commenced with a prologue, so he ends with an epilogue. It will be readily acknowledged that the 16 chapters, with prologue and epilogue, embrace a very wide field, over which it is not possible for a reviewer to ride his hobby rough-shod. He must go "cannily" along, and not a little "craning" may be pardonable, for he is not dealing with the work of an ordinary mind. The translator justly says—

"The principles of Swedenborg are more true now to the rational enquirer, than they could possibly be to the men of Swedenborg's own day:—wherever he adopted false facts; they furnished a worse basis for his system than the more solid materials of modern discovery. An example of

this occurs in the chapter on the kidneys, where the principle stated to govern the urinary series is confirmed by the recent observations of Mr. Bowman, better than by the hypothetical structure assigned to the parts previously, in the absence of experimental evidence." (Preface, pp. viii., ix.)

The plan of the work will be best told in the language of Swedenborg himself. He says (p. 10:)—

"I intend to examine, physically and philosophically, the whole anatomy of the Body; of all its Viscera, Abdominal and Thoracic; of the Genital Members of both sexes; and of the Organs of the five Senses. Likewise,

"The Anatomy of all parts of the Cerebrum, Cerebellum, Medulla Oblongata, and Medulla Spinalis.

"Afterwards the cortical substance of the two brains; and their medullary fibre; and the causes of the forces and motion of the whole organism. Diseases, moreover; those of the head particularly, or which proceed by defluxion from the Cerebrum.

"I propose afterwards to give an introduction to Rational Psychology, consisting of certain new doctrines, through the assistance of which we may be conducted, from the material organism of the body, to a knowledge of the soul, which is immaterial. These are the Doctrine of Forms; the Doctrine of Order and Degrees: also the Doctrine of Series and Society; the Doctrine of Influx; the Doctrine of Correspondence and Representation: lastly the Doctrine of Modification."

"From these doctrines I come to the Rational Psychology itself; which will comprise the subjects of action; of external and internal sense; of imagination and memory; also, of the affections of the animus. Of the intellect, that is of thought and of the will; and of the affections of the rational mind; also, of instinct.

"Lastly, of the Soul; and of its state in the Body, its intercourse, affection, and immortality; and of its state when the body dies. The work to conclude with a Concordance of Systems."

Such is the outline of the work, which the author intended to publish, but the whole has not been printed, some parts still remaining in manuscript.

It is impossible not to feel as we proceed in a criticism of "The Animal Kingdom" of Swedenborg, that justice can scarcely be hoped to be awarded it in the small space which can be allotted for that purpose in "The Monthly Review," but nevertheless we shall endeavor so to place some of the more prominent facts before the reader as to give him at least a general view of the contents of the whole volume.

The plan is this: Swedenborg collects together all that every author of celebrity in anatomy or physiology up to his age had said upon the structure or uses of the particular organ he is about to discuss, and then in the "Analysis" expresses his own opinions, drawing such conclusions and making such remarks, many of which are perfectly new to us, as tend to illustrate the particular doctrine which he is desirous of inculcating, namely the truth of revelation. And here before we proceed with our analysis, we shall go back to the prologue and quote some apposite, profound, and philosophical remarks:—

"The province of reason or intellect consists exclusively in considering and inquiring what is reasonable, profitable, and becoming in society, or

in the civil and moral world; and what is proper to be done in the kingdoms below it, the animal, the vegetable, and the mineral. Let the intellect be contented with its lot, and not aspire to higher things, which, inasmuch as they are sanctuaries and matters of revelation, exist to faith only. Furthermore, faith is banished as soon as ever the intellectual power endeavors to open the doors to its mysteries; for the intellect most commonly abolishes all faith in divine things; and what is received by the intellect, is not received by faith, that is to say, not by such a faith as elevates us above ourselves. And those who are inspired by a divine faith, completely despise the assistance of confirmatory arguments; perhaps they will laugh at this very book of mine—for where there is faith, what need is there of demonstration; as where there is sight, what need is there to talk of light?"

"22. I grant this; nor would I persuade any one who comprehends these high truths by faith, to attempt to comprehend them by his intellect; let him abstain from my books. Who so believes revelation implicitly, without consulting the intellect, is the happiest of mortals, the nearest to heaven, and at once a native of both worlds. But these pages of mine are written, with a view to those only, who never believe anything but what they can receive with the intellect; consequently, who boldly invalidate, and are fain to deny the existence of all super-eminent things, sublimer than themselves, as the soul itself, and what follows therefrom—its life, immortality, heaven, &c. &c. (p. 14.)"

To carry out this principle, he quotes the opinion of the following authors at full length: Heister's *Comp. Anat.* n. 285; Winslow's *Exposition Anat. de la struct. du Corps Humain; Traité de la Teste*, n. 504—538; Malpighi's *Exercitatio Epistolica de Lingua*. Swammerdam's *Biblia Naturæ*, p. 109; Boerhaave's *Institutiones Mediceæ*, n. 62—and refers to the following authors; Eustachius, *Tabul. Anat.*, Tab. xvii., fig. 2, 5, 8, 11, 18, 19, 20 (Edit. Colon. 1716;) Cowper, *Myotomia Reformata*; Morgagni, *Advers. Anat.*, i., tab. i. ii., &c.; Heisters' *Comp. Anat.*, tab. vii., fig. 34, 35; Malpighi, in Mangetus, *Theatr. Anatom.*, tab. cix., fig. 15, 16, 17, 18, 19; Bidloo in Mangetus, *T. A.*, tab. cix., fig. 8, 9, 13, 11, 12, 13, 14, 20.

From this specimen an idea may be formed of the nature of the preliminary study which must have been undertaken and persevered in ere he could indite his "Analysis," a specimen of which we shall now give.

"The primary, proper, and natural office of the tongue, consists in sucking, sipping, eating, and drinking; or, to speak more plainly, in receiving food for the nutrition of the body and the blood, in working this food about and forming it into a ball, and rolling the ball into the œsophagus and swallowing it. The tongue, considered in general, performs this office; it likewise performs the same office in all its parts; for it pretastes the first fruits, the extracts, the spirits, and the purer essences of the food; that is, it takes them up by little mouths, it nimbly works them about upon little tongues, it drinks them by imperceptible pores, and delivers them immediately to the blood. Thus the lesser parts perform not only the same office on a small scale as the entire tongue, but also the same offices as the tongue performs in conjunction with its associates and contiguous organs—the lips, the cheeks, the fauces, and the palate; and the least parts, as the tongue performs

in conjunction with its contiguous organs—the pharynx, the œsophagus, the stomach, &c. for the least in every series comprehends an idea of its universe." (p. 35, 36, 37.)

The second office he assigns to the tongue is that of "feeling and perceiving what is about to be received, with a view to becoming acquainted with its qualities: that is, in tasting." (p. 37.) The third office, "not, however, proper to it," is that of speech.

"By the office and gift of speaking, the tongue feeds the higher principles, the very mind itself; by the office of eating, it feeds the lower principles, or the body. Thus it may be said to afford food to both the soul and the body; wherefore it guards the meeting of the two ways which lead to the two regions of the body—to the viscera of the abdomen, through the pharynx and the œsophagus, and to the viscera of the chest through the larynx and the trachea; as well as the cross-way which leads to the cerebrum, the hall and palace of the mind. For this reason it is, that the human tongue has a less acute sense of taste than the tongues of the lower animals; for as in proportion as we approach the soul, in the same proportion we recede from the body." (pp. 38—39.)

In support of his statement, that the tongue consists of an infinity of "little tongues," he refers to Bidloo,* in whose plates are represented little tongues on the surface of the tongue. These are so many oval, pointed, or bicipital bodies. Also in Verheysen's, and Malpighi's plates, sinular representations are perceived. These little bodies are even visible in the tongue of the snail. "The tongue of the house-snail," says Swammerdam, "is covered on each side with many small parts, like the bronchiæ of fish, or like a comb with a double row of teeth," &c. Hence, Swedenborg infers, that there are as it were denticles or little teeth, which seize the nutritious particles, and carry them to the little cavities subjacent. Thence, he says, the same arrangement obtains in all the other members and organs; as in the eyes, where the globular parts in the vitreous humor are so many little eyes—a fact which is best seen in the eyes of the bee and fly. In the lungs—the least vesicles are so many little lungs. In the cerebrum, the cortical substances are so many primitive cerebellula. In the heart, the lacunæ, with their little columns, are so many ventricles of little hearts. This will at once unfold the system on which Swedenborg so learnedly insisted.

The reason he assigns for saying that the office of speaking is not proper, or is not exclusively vested in the tongue, is that it only disposes the muscles designed for manducation, at pleasure, in a new way; for several of the bird tribe, as daws, crows, &c., may be made to speak, although speech is not a proper faculty of their tongues. He acknowledges, however, that the motions are determined by a previous will, as they require to be learned by the young. He is further strengthened in his opinion by history, which relates that many persons have been able to speak without tongues, and that Winslow quotes from Riolan's *Anthropographia*, the case of a child, five years

* Bidloo was physician to William III. Cowper stole some of his plates for his "Anatomy of Human Bodies," but not without remonstrance. Bidloo was born at Amsterdam in 1649. His great work is the "Anatomia Corporis Humani," fol. 1685. This is the publication from which Cowper purloined the plates. At the death of King William he returned to Holland, and died there in 1713.

old, who, although it had lost its tongue from the small pox, spoke almost as distinctly as before. In this case, however, the uvula was intact. In the Memoirs of the Royal Academy of Sciences, there is a report by Jussieu of the case of a girl born without a tongue; yet she could speak. In this instance a small tubercle occupied the place of the tongue. We may add, that there are other cases on record attestive of this opinion of Swedenborg.

After minutely describing the nerves and muscles of the tongue, he proceeds to tell us, in his own way, to the end, "that the ear may be instantly conscious of the manner in which sounds are first articulated, from the very earliest efforts of the infantile tongue, a small branch of the fifth pair, in a manner recurrent from the tongue, enters the membrane and cavity of the tympanum, and unites with the portio dura of the acoustic nerve, as it traverses the Eustachian tube; whereby the ear prestalling a passage through the fauces, is enabled to know what is going on in the larynx and the tongue: and the voice, in its first conception, is rendered in unison with the voice, as it issues from the mouth, and is received by the external ear and the membrana tympania."

In describing the lips, mouth, and palate, he gives us this very correct and very scientific account of the manner in which the palate acts when we are about to drink:—

"When the tongue is about to drink, the palate particularly assists and conspires. The lips first draw in the fluid by their aperture; the tongue takes it up on its apex and edges, pours it in on its dorsum, and rolls it gently into the gorge of the palate; it then raises and wreathes up its base from the root, close under the folds of the palate: the palate also unfolds, and lets down the shaggy velum from above; and in this way the two secure the passage against the return of the fluid; which thus, destitute alike of gravity and levity, glides along the smooth surface of the œsophagus into the stomach. Two singular powers of the tongue and the palate unite in the act of drinking. *Firstly*, of arresting the fluid at any part of the cavity of the throat, and of pushing it onwards from point to point, either by sips or in streams; this power is owing to the tortility of the tongue, and to the flexibility of the membrana and velum palati. *Secondly*, of exercising a kind of suction or attraction, at will, on any particular isolated spaces. The tongue and the palate imbibe these powers with the mother's milk, and momentarily exercise them so easily, that we ourselves are not aware of their very existence. The consequence is, that liquids, and even solids, descend from the commencement of the mouth (I do not say from the lips) into the gullet, as easily as if they were absolutely destitute of gravity and levity; and as if, in every position, the lips were upwards with respect to them, and the gullet downwards; for every point of the tongue, and every point of the mouth, acts thither by the two powers already mentioned; thus every point of the fluid is actuated thither by a kind of centripetency. Hence, draughts of liquids ascend as easily as they descend; which we see exemplified in jugglers, who will drain their bowls while standing on their heads; and in long-necked birds, as the goose, the swan, the crane, &c., and in quadrupeds which lap, eat, and drink, with their heads hanging down: more plainly still in those insects which suck their food through extensile, flexible, and

retractile suckers, and carry it thereby into their gullets and stomachs. Indeed, this mechanism of the throat seems designed to prevent liquid from acting at all of its own gravity; as is clear from the fact, that when water is poured into the mouth of a person lying on his back, it instantly regurgitates from the pharynx; evidently in order that no intrusion may take place, and thus nothing may be carried in without the tongue previously feeling, and willing it." (N. 69, pp. 79, 80.)

On the *stomach*, Swedenborg has expended much labor, and the "Analysis" is one of the most important in the volume. Besides, the multiplicity of authors quoted at length, is not the least valuable portion of the chapter, for the student may take his choice of Heister, Winslow, Ruysch, Leeuwenhoek, Swammerdam, Glisson, Hartman, Schurig, &c., as each of these authors are quoted verbatim—a plan that is extremely convenient, and evinces a mind conscious of its own powers, considerate towards others, and anxious for the truth. He quotes from Schurig, some curious passages to the effect of irregular position of the stomach, of large, small, thin, double, perforated, and ruptured stomachs; of food remaining in the stomach for a long time, also grapes, pills, pieces of sausage, pickled ginger, suet, lettuce, thorns, oats, plum-stones, rose leaves, hydatids, stones, lice, a three-pronged fork, and various other things.

Indeed, the extracts from Schurig are of a most interesting and engrossing nature, and the "Analysis" no less so. But there is scarcely anything that has not at different times been swallowed, as the following list will show; viz., crab's claws, pebbles, Persian apples, packing needles, common needles, diamonds, rings, nails, money, a pipe, a child's rattle, a golden cross, a surgical speculum, the links of a chain, a pair of scissors, a clasp, the point of a knife, the stalk of an iron pot, and an iron whetstone! Schurig speaks also of knife-eaters (one, it will be recollected, some years since exhibited himself in London) of Prague, at Basle, Halle, London, and Hamburg; also, glass-eaters, stone-eaters, poison-eaters, "and those who could eat anything whatever!"* He also mentions a Maltese drunkard, who, after drinking twenty or thirty glasses of water, would vomit them up again for the amusement of the by-standers, and either spirt the glasses full one after another, or else eject the entire volume of the fluid to a distance of twenty feet, or more! Of instances of diseased appetites, as pica and malacia, or *mal d'estomac* (*dirt-eating* of the Africans) it is not necessary to say much. That which seems most worthy of notice, is where he tells us pica has been noticed in the cat and dog; and in man in form of depraved appetite for water, milk, whey, and vinegar; of longing for peculiar odors and smells; for sucking the wind out of bellows! for throwing eggs into each other's faces; for receiving slaps!! and for thieving!!!—*Chylogogia Historico-Medica*, 4to. *Dresde*, 1735. (p. 92—96.)

But we must, however reluctant, bring this review to an end—though as may well be conceived, we have not done, nor *could* we hope to do, anything like justice (as we have before said) to a work of such immeasurable value as this is, in the short compass of one article. However, we have said enough, we trust, to induce the reader to study it himself. We make room for this description of the stomach, which is, without exception,

* *Vide* Schurig. *Chylog.*, pp. 367, 398, 436, and 445.

the best we ever read, and we believe, the most intelligible ever written.

"The stomach, like a large bladder, or tubulated retort, receives in its bosom, through what is called the cardiac orifice, every kind of saliva and available food;—commixes, circulates, squeezes, strains, bruises, triturates, macerates, seethes, extracts, in a word *digests it*; then carries it onwards, drives it through certain foramina and evaporates and sublimes it along certain ducts, its appointed passages:—summons and sharpens the menstrua, and increases its forces, according to the measure, degree, and success of the operation; and again repeats the processes; that is to say, reduces, fittens, corrects and seethes the materials which have been once digested; and all the time, transmits the rectified portions through foramina into tubular passages; but sends off what it has not thoroughly laid open (*reclusit.*) through the pylorus into the intestines." (N. 94, p. 122.)

We have thus far exhibited Swedenborg's anatomical knowledge. We shall now extract an outline of his "Doctrine of Forms," to which it is possible to believe some late writers have had recourse, without acknowledgment; but we cannot now enter upon that question.

"I intend to explain the nature of the spiral form (he is speaking of the spiral vessels in the stomach) in an especial doctrine of forms. Meanwhile, for the better understanding of the subjects mentioned in this chapter, I will here state, that forms ascend from the lowest to the highest, in order and by degrees, as do also the essences and substances of all things. The lowest form is the *angular*; which is also called the terrestrial, and the merely corporeal form, inasmuch as it is peculiar to bodies having angles and rectilinear planes; the measurement of which is the primary object of the present geometry. The second and next higher form is the *circular* or *spherical* form; which may also be called the *perpetual angular*, since the circumference of the circle involves neither angle nor rectilinear plane, because it is a perpetual angle and perpetual plane: this form is at once the parent and the measure of angular forms, for it is the means of showing the properties of angles and figures, as trigonometry teaches. The form above this is the *spiral*, which is the parent and the measure of circular forms, as the circular form is the parent and the measure of angular forms. Its very radii or diameters are not rectilinear, nor do they converge to a fixed centre, like those of the circle, but they are variously circular, and have a spherical surface for a centre; wherefore the spiral is also called the *perpetual circular*. Our science of geometry rises almost to this form, but dare not enter it, or peruse its spirals; for at the first glance it strikes us as inextricable, and seems to sport with our ideas. This form never exists or subsists without poles, an axis, foci, a greatest circle, and lesser circles which are its diameters; and as it again assumes a perpetuity which is wanting in the circular form, namely, in respect to diameters and centres, therefore it emulates and breathes a natural spontaneity in its motion: as also appears from the stomach and its segments after death, for when its nerves are only touched it rolls and wreathes as in the living subject, and flows spontaneously into its gyres, as though it were still hungering, and longing to grind the food: there being nothing that can prove an obstacle; inasmuch as there are no angles, and consequently no hindrances to

motion. There are other still higher forms, as the *perpetual-spiral*, properly the *vertical*: the *perpetual-vertical*, properly the *celestial*: and a highest, the *perpetual celestial*, which is *SPIRITUAL*, and has within it nothing but what is everlasting and infinite." (f) p. 128.

From this it will be perceived that the doctrine of forms in orders and degrees, requires some study to understand, more to apprehend, and a great deal to comprehend all its bearing and parts, as applied to man in his present condition. But at the same time, we cannot refuse our concurrence in the mode or manner in which the argument is put, for if the proposition be admitted, the series of deductions that follow cannot be denied. In conclusion, we record our opinion, positively, and not relatively: wholly, and without reservation, that if the mode of reasoning and explanation adopted by Swedenborg be once understood, the anatomist and physiologist will acquire more information, and obtain a more comprehensive view of the human body, and its relation to a higher sphere, than from any single book ever published; nay, we may add than from all the books which have been written (especially in modern times) on physiology, or as it has been lately named, transcendental anatomy.

Swedenborg reasons not on any hypothesis, not on any theory, not on any favorite doctrine of a fashionable school, but on the solid principles of geometry, based on the immutable rock of truth: and he must and will be considered at no distant period the Zoroaster of Europe, and the Prometheus of a new era of reason, however at present the clouds of prejudice may intervene, or the storms of passion obscure the coruscations of his intellect.

The American Review: A Whig Journal of Politics, Literature, Art, and Science. No. 1. January 1845. Wiley and Putnam, London and New York.

This periodical is intended to be the organ of the whig party in the United States, which has recently incurred so unexpected a reverse in the defeat of their candidate for the presidency, Mr. Clay. It is printed in double columns, like Blackwood, and, though termed a review, partakes much more of the character of a magazine. The subjects treated of in this number are various and interesting, most of them being tinged, more or less, with the party views of the writers. The characteristic feature is an aversion to democracy, or rather to the democratic party, for there is a great profession of respect for republican principles, democracy being, according to the reviewers, good or bad, accordingly as it exalts or depresses their own party. Most of the articles are so tinged with partizanship as to detract much from their value to English readers, who cannot enter into squabbles which appear to them very like the corporation contests of a provincial town. But when the writers depart from this narrow field, and wander in the broad highway of literature, they exhibit a sound taste and an impartiality of judgment which might worthily be imitated by some of our own critics. This is exemplified in the article on Miss Barrett's Poems, with which we were much pleased. The original poetry is respectable common-place, and contrasts strikingly with the bold flights of the British poetess.—*Critic.*

From Punch.

MRS. CAUDLE'S CURTAIN LECTURES.

MR. CAUDLE HAS LENT AN ACQUAINTANCE THE FAMILY UMBRELLA. MRS. CAUDLE LECTURES THEREON.

"Ah! That's the third umbrella gone since Christmas. What were you to do? Why let him go home in the rain, to be sure. I'm very certain there was nothing about him that could spoil. Take cold, indeed! He does n't look like one of the sort to take cold. Besides, he'd have better taken cold than take our only umbrella. Do you hear the rain, Mr. Caudle? I say, do you hear the rain? And as I'm alive, if it isn't Saint Swithin's day! Do you hear it against the windows! Nonsense; you don't impose upon me. You can't be asleep with such a shower as that! Do you hear it, I say? Oh, you do hear it! Well, that's a pretty flood, I think, to last for six weeks; and no stirring all the time out of the house. Pooh! don't think me a fool, Mr. Caudle. Don't insult me. He return the umbrella! Anybody would think you were born yesterday. As if anybody ever *did* return an umbrella! There—do you hear it! Worse and worse! Cats and dogs, and for six weeks—always six weeks. And no umbrella!

"I should like to know how the children are to go to school to-morrow. They shan't go through such weather, I'm determined. No: they shall stop at home and never learn anything—the blessed creatures!—sooner than go and get wet. And when they grow up, I wonder who they'll have to thank for knowing nothing—who, indeed, but their father! People who can't feel for their own children ought never to be fathers.

"But I know why you lent the umbrella. Oh, yes; I know very well. I was going out to tea at dear mother's to-morrow—you knew that; and you did it on purpose. Don't tell me; you hate me to go there, and take every mean advantage to hinder me. But don't you think it, Mr. Caudle. No, sir; if it comes down in buckets—full, I'll go all the more. No: and I won't have a cab! Where do you think the money's to come from? You've got nice high notions at that club of your's! A cab, indeed! Cost me sixteenpence at least—sixteenpence!—two-and-eightpence, for there's back again! Cabs, indeed! I should like to know who's to pay for 'em! I can't pay for 'em; and I'm sure you can't, if you go on as you do; throwing away your property, and beggaring your children—buying umbrellas!

"Do you hear the rain, Mr. Caudle? I say, do you hear it! But I don't care—I'll go to mother's to-morrow: I will; and what's more, I'll walk every step of the way—and you know that will give me my death. Don't call me a foolish woman—it's you that's the foolish man. You know I can't wear clogs; and with no umbrella, the wet's sure to give me a cold—it always does. But what do you care for that? Nothing at all. I may be laid up for what you care, as I daresay I shall—and a pretty doctor's bill there'll be. I hope there will! It will teach you to lend your umbrellas again. I should n't wonder if I caught my death; yes: and that's what you lent the umbrella for. Of course!

"Nice clothes, I shall get too, trapesing through weather like this. My gown and bonnet will be spoiled quite. Need n't I wear 'em then! Indeed, Mr. Caudle, I shall wear 'em.

No, sir, I'm not going out a dowdy to please you or anybody else. Gracious knows! it is n't often that I step over the threshold; indeed, I might as well be a slave at once—better, I should say. But when I do go out, Mr. Caudle, I choose to go as a lady. Oh! that rain—if it is n't enough to break in the windows.

"Ugh! I do look forward with dread for to-morrow! How I am to go to mother's I'm sure I can't tell. But if I die, I'll do it. No, sir; I won't borrow an umbrella. No; and you shan't buy one. (*With great emphasis*.) Mr. Caudle, if you bring home another umbrella, I'll throw it in the street. I'll have my own umbrella, or none at all.

"Ha! and it was only last week I had a new nozzle put to that umbrella. I'm sure if I'd have known as much as I do now, it might have gone without one for me. Paying for new nozzles, for other people to laugh at you. Oh, it's all very well for you—you can go to sleep. You've no thought of your poor patient wife, and your own dear children. You think of nothing but lending umbrellas!

"Men, indeed!—Call themselves lords of the creation!—pretty lords, when they can't even take care of an umbrella!

"I know that walk to-morrow will be the death of me. But that's what you want—then you may go to your club, and do as you like—and then, nicely my poor dear children will be used—but then, sir, then you'll be happy. Oh, don't tell me! I know you will. Else you'd never have lent the umbrella!

"You have to go on Thursday about that summons; and, of course, you can't go. No, indeed, you *don't* go without the umbrella. You may lose the debt for what I care—it won't be so much as spoiling your clothes—better lose it: people deserve to lose debts who lend umbrellas!

"And I should like to know how I'm to go to mother's without the umbrella! Oh, don't tell me that I said I *would* go—that's nothing to do with it; nothing at all. She'll think I'm neglecting her, and the little money we were to have, we shan't have at all—because we've no umbrella.

"The children, too! Dear things! They'll be sopping wet; for they shan't stop at home—they shan't lose their learning; it's all their father will leave 'm, I'm sure. But they *shall* go to school. Don't tell me I said they should n't: you are so aggravating, Caudle; you'd spoil the temper of an angel. They *shall* go to school; mark that. And if they get their deaths of cold, it's not my fault—I did n't lend the umbrella."

"Here," says Caudle in his MS., "I fell asleep; and dreamt that the sky was turned into green calico, with whalebone ribs; that, in fact, the whole world revolved under a tremendous umbrella!"

MR. CAUDLE HAS VENTURED A REMONSTRANCE ON HIS DAY'S DINNER: COLD MUTTON, AND NO PUDDING. MRS. CAUDLE DEFENDS THE COLD SHOULDER.

HUMPH! I'm sure! Well! I wonder what it will be next! There's nothing proper now—nothing at all. Better get somebody else to keep the house I think. I can't do it now, it seems; I'm

only in the way here : I 'd better take the children, and go.

"What am I grumbling about now? It's very well for you to ask that! I'm sure I'd better be out of the world than—there now, Mr. Caudle; there you are again! I *shall* speak, sir. It is n't often I open my mouth, heaven knows! But you like to hear nobody talk but yourself. You ought to have married a negro slave, and not any respectable woman.

"You're to go about the house looking like thunder all the day, and I'm not to say a word. Where do you think pudding's to come from every day! You show a nice example to your children, you do; complaining, and turning your nose up at a sweet piece of cold mutton, because there's no pudding! You go a nice way to make 'em extravagant—teach 'em nice lessons to begin the world with. Do you know what puddings cost; or do you think they fly in at the window!

"You hate cold mutton. The more shame for you, Mr. Caudle. I'm sure you've the stomach of a lord, you have, No, sir; I did n't choose to hash the mutton. It's very easy for you to say hash it; but I know what a joint loses in hashing: it's a day's dinner the less, if it's a bit. Yes, I dare say; other people may have puddings with cold mutton. No doubt of it; and other people become bankrupts. But if ever you get into the Gazette, it shant be *my* fault—no; I'll do my duty as a wife to you, Mr. Caudle: you shall never have it to say that it was *my* housekeeping that brought you to beggary. No; you may sulk at the cold meat—ha! I hope you'll never live to want such a piece of cold mutton as we had to-day! And you may threaten to go to a tavern to dine; but with our present means, not a crumb of pudding do you get from me. You shall have nothing but the cold joint—nothing as I'm a Christian sinner.

"Yes; there you are, throwing those fowls in my face again! I know you once brought home a pair of fowls; I know it: and warn't you mean enough to want to stop 'em out of my week's money! Oh, the selfishness—the shabbiness of men! They can go out and throw away pounds upon pounds with a pack of people who laugh at 'em afterwards; but if it's anything wanting for their own homes, their poor wives may hunt for it. I wonder you don't blush to name those fowls again! I would n't be so little for the world, Mr. Caudle!

"What are you going to do? Going to get up! Don't make yourself ridiculous, Mr. Caudle; I can't say a word to you like any other wife, but you must threaten to get up. Do be ashamed of yourself.

"Puddings, indeed! Do you think I'm made of puddings! Did n't you have some boiled rice three weeks ago! Besides, is this the time of the year for puddings! It's all very well if I had money enough allowed me like any other wife to keep the house with; then, indeed, I might have preserves like any other woman; now, it's impossible; and it's cruel—yes, Mr. Caudle, cruel—of you to expect it.

"Apples arn't so dear, arn't they! I know what apples are, Mr. Caudle, without your telling me. But I suppose you want something more than apples for dumplings! I suppose sugar costs something, does n't it! And that's how it is. That's how one expense brings on another, and that's how people go to ruin.

"Pancakes! What the use of your lying muttering there about pancakes? Don't you always have 'em once a-year—every Shrove Tuesday! And what would any moderate, decent man want more!"

"Pancakes, indeed! Pray, Mr. Caudle—no, it's no use your saying fine words to me to let you go to sleep; I shan't!—pray do you know the price of eggs just now! There's not an egg you can trust to under seven and eight a shilling; well, you've only just to reckon up how many eggs—don't lie swearing there at the eggs, in that manner, Mr. Caudle; unless you expect the bed to open under you. You call yourself a respectable tradesman, I suppose! Ha! I only wish people knew you as well as I do! Swearing at eggs, indeed! But I'm tired of this usage, Mr. Caudle; quite tired of it; and I don't care how soon it's ended!

"I'm sure I do nothing but work and labor, and think how to make the most of everything; and this is how I'm rewarded. I should like to see anybody whose joints go further than mine. But if I was to throw away your money into the street, or lay it out in fine feathers on myself, I should be better thought of. The woman who studies her husband and her family is always made a drudge of. It's your fine fal-lal wives who've the best time of it.

"What's the use of your lying groaning there in that manner! That won't make me hold my tongue, I can tell you. You think to have it all your own way—but you won't, Mr. Caudle! You can insult my dinner; look like a demon, I may say, at a wholesome piece of cold mutton—ha! the thousands of far better creatures than you are who'd been thankful for that mutton!—and I'm never to speak! But you're mistaken—I will! Your usage of me, Mr. Caudle, is infamous—unworthy of a man. I only wish people knew you for what you are! but they shall some day.

"Puddings! And now I suppose I shall hear of nothing but puddings! Yes, and I know what it would end in. First, you'd have a pudding every day; oh, I know your extravagance—then you'd go for fish—then I should n't wonder if you'd have soup; turtle, no doubt: then you'd go for a dessert; and—oh! I see it all as plain as the quilt before me—but no! not while I live! What your second wife may do, I don't know; perhaps *she*'ll be a fine lady; but you shan't be ruined by me, Mr. Caudle; that I'm determined. Puddings, indeed! Pu-dding-s! Pudd—"

"Exhausted nature," says Caudle, "could hold out no longer. Here my wife went to sleep."

BALLAD BY THE REV. HENRY ALFORD, M. A.

Rise, sons of merry England, from mountain and from plain;—
Let each light up his spirit, let none unmoved remain;
The morning is before you, and glorious is the sun;
Rise up and do your blessed work before the day be done.

'Come help us, come and help us,'—from the valley and the hill,
To the ear of God in heaven are the cries ascending still:
The soul that wanteth knowledge, the flesh that wanteth food;—
Arise, ye sons of England, go about doing good.

Your hundreds and your thousands at usage and
in purse,
Behold a safe investment which shall bless and
never curse!

O who would spend for house or land, if he
might but from above
Draw down the sweet and holy dew of happiness
and love?

Pour out upon the needy ones the soft and healing
balm;

The storm hath not arisen yet—ye yet may keep
the calm:

Already mounts the darkness—the warning wind
is loud;

But ye may seek your father's God, and pray
away the cloud.

Go, through our ancient churches, and on the holy
floor

Kneel humbly in your penitence among the kneeling
poor;

Cry out at morn and even, and amid the busy day,
"Spare, spare, O Lord, thy people!—O cast us
not away!"

Hush down the sounds of quarrel, let party names
alone,—

Let brother join with brother, and England claim
her own.

In battle with the Mammon-host join peasant, clerk
and lord;

Sweet charity your banner-flag, and GOD FOR ALL
your word.

Parker's Magazine.

The Individuality of the Individual. A Lecture,
by WILLIAM MACCALL, author of "The Doc-
trine of Individuality," "The Agents of Civiliza-
tion," &c. London, Chapman, Newgate-
street.

RARELY, perhaps never, have we seen so small
a book containing such comprehensive thoughts.
Mr. Maccall does not think in leading strings,
neither does he borrow the mannerisms of com-
position; in truth he is the embodiment of his own
idea, and hence the individuality of his writings.
He would teach man self-reliance; that he has a
distinctive character. In this Young England will
readily concur. We remember what an American
writer has finely said on the subject: "An insti-
tution is the lengthened shadow of one man; as
the Reformation of Luther; Quakerism of Fox;
Methodism of Wesley; Abolition of Clarkson."

This lecture will teach, not so much what is
unlearned, as that which, having been learned, is
partially forgotten. It is no wonder that the indi-
vidual is overlooked in the large congregations of
men. In politics, as in all present movements,
party is the only power acknowledged; but the
individual is not less active, not less effective.
Genius is always individual, as that of Michael
Angelo, Shakspeare, and Scott. There was not a
national individuality, but, apart from country, the
individuality of *mind*. Lesser spirits possess it in
a corresponding degree. We believe that what is
called the eccentricity of a man is but the un-
trained working of his individuality. Mr. Maccall
would educate the individuality that it may yield
its full fruits for the benefit of the race. He
denounces the plan of educating all children alike.
He says:—

"The imaginative child, if educated according
to his distinctive nature, would help to correct the
exaggeration and to soften the angularity of the
logical child, and to throw around the sensitive
child ideal visions—which would hinder him from
dwelling with anguish on every exhibition of dis-
tress; and the sensitive child, if educated accord-
ing to his distinctive nature, would teach the imag-
inative child not to dwell in imagination as a mere
selfish luxury, but to shed its colors as a benignity
on the rugged realities of others, to whom the
reality is too real, and would teach the logical
child how vain is logic without feeling, and that
doubt was only given by God in order to conduct
to faith; and the logical child, if educated accord-
ing to his distinctive nature, would teach the imag-
inative child that all fancy is but the brilliant
shadow of truth; and would teach the sensitive
child that the sensibility that is not healthy, not in
harmony with the other powers, is useless to the
world, in proportion as it is a torture to itself."

We have said enough of this little pamphlet to
recommend it, which we do, not so much for its
novelty, as for its truth; not so much that it is
conceived with the elegance of a poet, as that it is
expressed with the honesty of a man.—*Critic.*

LAMENT OF D'ISRAELI

I REALLY can't imagine why,
With my confessed ability—
From the ungrateful Tories, I
Get nothing—but civility.

The "independent" dodge I've tried,
I've also tried servility;—
It's all the same—they *won't* provide—
I only get—civility.

I've flattered Peel; he smiles back thanks
With Belial's own tranquility;
But still he keeps me in "the ranks,"
And pays me—with civility.

I've worried him, I've sneered at him,
I've threatened bold hostility—
But no—he still preserves his im-
perturbable civility.

If not the birth, at least I've now
The *manners* of nobility;
But yet Sir Robert scorns to bow
With more than mere civility.

Well, I've been pretty mild as yet,
But now I'll try scurrility;
It's very hard if *that* don't get
Me more than mere civility.—*Punch.*

BELIEF AND DOUBT.—When anything strikes
the mind as a truth, however distasteful it may be,
or opposed to our former feelings, we have no
option—the instant we see it as true, we are con-
strained to embrace it; we cannot say we will or
will not—it is a necessity, and we must. The
first distinctly recognized doubt is of the same
kind; we may struggle against it as we will, but
there it is, a wedge inserted into the very fabric
of our faith, which splits to the foundation, and
falls off from us, leaving us naked and trembling
among its ruins.—*Zoe.*

From the Polytechnic Review.

ON NOVEL APPLIANCES OF WAR, PROPOSED OR EXECUTED, SO FAR AS RELATES TO PROJECTILES.

HAVING attended to most of the circumstances which limit the range of projectiles, we purpose now to state, as shortly as is consistent with truth and justice to the subject, the means which have been proposed to increase this range; we will also mention the results of these suggestions, so far as they have been carried into practice, and will discuss the probability of the existence of methods said to be kept secret, and the chance of the discovery of others.

We have already alluded to the common supposition that chemical science may present the artilleryman with some substance that is, in common parlance, "stronger" than gunpowder, and that by this means a vast increase of range may be effected. We have shown the futility of this opinion; we have proved that chemists disclaim any such knowledge: we have demonstrated that if they should claim to be the depositaries of such a secret, the mathematician and practical artilleryman would treat the statement with unbelief, and justly too, because it is in opposition to incontrovertible laws. As well might a chemist say that he could annihilate the attraction of gravitation, as that he could elaborate such a peculiar composition or gunpowder.

It may be said that chemistry is a field whose treasures are but little known; that although such explosive compounds as chemists generally are aware of may be inferior in propulsive force to gunpowder, this mere fact is not sufficient in itself to warrant a supposition that some peculiar composition of exceeding potency may not be discovered and held in secrecy by one favored individual; still *our* objection applies not the less. There is a point beyond which no increase of primary force can increase the range of a projectile, and this point is far within the limits which circumscribe the force of gunpowder.

We are justified in asserting, then, that far advanced as are all sciences connected with military engineering, in the present day, very little increase of the range of common ordnance (we mean cannons and engines of that class) will be effected; and that this little will be accomplished, not through any new composition of gunpowder, but as a consequence of improvement in the mechanical construction of missiles, and their projecting ordnance.

The longest range and greatest velocity ever accomplished by any ordnance, ancient or modern, up to the period of 1840, and we believe to the present time, is 5,720 yards, or just three miles and a quarter. The whole time of flight was only thirty seconds and a quarter, which is estimated at 2,100 feet, in the first second of time. The piece of ordnance used on this occasion was a fifty-six-pounder cannon, cast on the principles of Mr. Monk, who suggested the propriety of removing a considerable proportion of useless metal from the gun before the trunions, and adding it to the breech, where alone increased strength is desirable. This arrangement permits the use of a larger projecting charge of gunpowder, without risking the calamity of bursting. The quantity of powder employed in the experiment alluded to was ten pounds, and *the ball weighed sixty-two*

pounds and a-half, a circumstance which requires some explanation, seeing that we have stated the gun to be a fifty-eight pounder. The explanation is this: the momentum of a projectile is the product of its mass and its velocity; by increasing that mass, therefore, or, in other words, by adding to its weight without adding to its size, we acquire a proportionate increase of momentum, and a consequent increase of range. The shot on the present occasion was an iron shell filled with lead; hence its weight of sixty-two pounds and a half.

Nearly the same range was accomplished by the French during the Peninsular war, who threw shells into Cadiz, rather more than a distance of three miles; they, however, used enormous mortars, one of which is at present in St. James' Park, and employed the largest charges of gunpowder ever known in modern times; the missiles projected, moreover, were shells *nearly* filled with lead, the remaining space containing gunpowder ignitable by a fuse as in the common shell.

The fact that leaden balls accomplish a longer range than iron ones, seems to have been discovered, at least *once* by chance, the discoverers being totally ignorant of the principles on which the circumstance was founded. It is related that during the war an American ship having expended all her cannon-balls, and being unable to procure others of a similar kind, had some prepared of lead; when on employing them in a subsequent action, her captain and crew were surprised at their long range and efficacy. Sir Howard Douglas is so satisfied of their advantages on peculiar occasions, that he recommends their introduction in the navy.

Amongst the suggestions which naturally present themselves for increasing the range of a shot, a very obvious one seems to be the diminution of its windage, or the space which exists between it and the inside of the gun. Thus is reduced to a minimum the loss experienced by the escape of the gunpowder around the sides of the ball. That short kind of ordnance, the carronade, is made to embrace this amongst other principles, and the result of practice fully warrants, in this case, the justice of the theory. To long guns, however, the rule does not apply—a fact which may seem strange at first, but which can be easily explained. With very great velocities and long guns there is a large column of air to be displaced before the ball leaves the gun, and which is condensed with great rapidity by the force of the ball, to which it offers immense resistance if it fit the gun closely. If, however, the size of the ball be reduced, the air has more space to rush round it, and the ball more easily escapes.

Believing as we do that no considerable increase of range, from guns of the sizes at present in use, will ever be acquired, the question still remains unanswered whether such increased range may not be achieved by other means. For the sake of precision, we will assume this increased range to be six miles, and will ask whether such can be accomplished by any method, or combination of methods? We do not regard it as totally impossible;—we see no primary law of nature against it, although we recognize difficulties so grave, and so numerous, as to check even the wild excursions of our fancy; and we are not theoretical enough to forget that even the mere possibility of this range granted, its military application is quite another thing;—involving considerations of facility, expense, and amount of scientific acquirement;

besides a thousand and one others, all separate from the original question. As to the *possibility* of such a range, stripped of all accessory and contingent difficulties, our opinion is in the affirmative, although we are aware that the investigation of others, more practically conversant with these matters than ourselves, does not lead them to a similar conclusion. If a cannon-ball, when its flight was nearly expended, could meet with some aerial gun to urge it forward again—if, in other words, its flight could be made to depend on two or more consecutive impulses, instead of one primary shock, its range would be evidently increased. Now, in reality, these desiderata are to a great extent accomplished by the rocket, which carries its own propelling agent with it. The question, whether a cannon-ball, of the largest present size, can be shot six miles, involves a primary law of nature—a law which must be suspended before the question can be answered in the affirmative, and which consequently is an impossibility. The question, whether a rocket can accomplish this distance, involves no such suspension of a natural law, and no such impossibility. The rocket presents us with certain theoretical conditions necessary for the end in view; it remains to ascertain whether they can be sufficiently elaborated.

But in thus ideally suggesting a probable range of six miles, we need not assume the necessity of any increase of range either of gun or rocket. We will suppose a missile to be formed of a combination of one ball and two or more rockets; this missile first to be projected from a gun, during which a fuse is to be ignited, and to burn during its trajectory course, in such a manner as to ignite the first rocket. This rocket is now to free itself from the ball, which falls; the rocket proceeding in its course, and eventually igniting the other rocket; this last accomplishes the termination of the distance.

All this may be assumed as possible, although involving thousands of difficulties to which we do not require to have our attention drawn. We know the irregular flight of rockets—we know the difficulty which their sticks would occasion when thus shot from ordnance—in short, we are not visionary nor sanguine on the subject, and could fill half a dozen pages with difficulties and objections to the scheme—yet we see no reason why it *must* be regarded as impossible. Our ideas as to the precision of flight of such a missile would be very moderate. For our own part, if we rejoiced in a size a thousand times greater than our present dimensions—if we out-rivalled in stature the Cyclopes of old—we would willingly, for the tenth part of three hundred thousand pounds, expose our vast bulk in any aspect the operator might most desire, for the long space of three months, and at four miles distance, as a target for such a weapon. We would stipulate, however, that we should be distinctly and accurately aimed at; conceiving, like a certain spaniel who always posted himself exactly opposite the muzzle of his master's gun, that the charge was more likely to take any other direction than the one desired.

The attention of the public was a short time ago on the *qui vive* about long ranges, being directed to this subject in consequence of the circumstances disclosed by Mr. Warner, who probably had in view the very plan of accomplishing a six-mile range that we have already mentioned, inasmuch as he asserted that a two-pounder gun made on a

peculiar construction would be sufficient to accomplish it. Now, we well know, that, *ceteris paribus*, the longest range will be accomplished by the largest gun, and that a two-pounder cannon is smaller than any in our service; without intending any disrespect to any one, then, we may safely assert that to project a ball six miles from a two-pounder by the mere primary force of gunpowder is a physical impossibility; and that if such range be accomplished, and a two-pounder cannon be instrumental in accomplishing it, this can only be effected by some such plan as we have described. We have another reason for presuming Mr. Warner to have intended this to be the plan—he disclaims most pointedly ever having asserted that he could project by means of a two-pounder a *cannon-ball* six miles; but he avoids stating that the two-pounder is not to be instrumental in projecting a missile of name unknown to that distance, and he requires a two-pounder peculiarly constructed.

We here leave this part of the subject, and proceed to the consideration of some other improvements which have either been introduced or are proposed to be introduced to the war-like art. The mere projection of missiles by the force of gunpowder was a great discovery; the application of the same substance to the bursting of shells was an ingenious and useful extension of it, adding to the mere projectile force of the ball the devastation and the consequent terror of fire, together with the primary explosive power and disintegrating influence of gunpowder. When first shells were thrown from mortars, pyrotechnical science was not sufficiently advanced to render the period of their bursting at all certain; neither were the principles or practice of their firing well known. They were ill-constructed, ill-managed, and moreover a prejudice existed that the fuse must be lighted before the charge was fired, which added considerably to the danger as well as the trouble of mortar practice.

These defects are now, to a great extent, overcome; shells are cast of equal weight, and their fuses correspond so well amongst themselves as regards time of burning, that the distance of projection being known, the time of bursting can be calculated with wonderful accuracy. When, however, it is considered that a small fraction of a second is on some occasions a matter of considerable importance, and that such an amount of accuracy is hardly possible to be expected from the use of the fuse, it will be evident that any simple and at the same time safe and effective plan of procuring the explosion altogether independently of the fuse, would be a desideratum. The various substances known to chemists as capable of exploding by percussion, favors the idea of a substitute. Could not a shell be filled with gunpowder, as is usually done, and furnished in some manner with an appendage, such as the copper percussion cap for instance, which might explode when the shell struck the object, and thus ignite the contained charge? Instead of a shell furnished with a percussive appendage, could not the percussive-material form part of the shell? These are amongst the most obvious questions which present themselves, and at a first blush they seem easily answerable in the affirmative; but a little consideration will develop many difficulties. There is no difficulty experienced in making a shell explode on percussion, but it is exceedingly difficult to make it explode when wanted. The primary impulse of the charge of the gun is in itself a strong

percussive agent, and hence percussive shells as frequently explode immediately on leaving the gun as on striking their object. This is a very great disadvantage, although certainly not insuperable; a far greater one is the difficulty and danger of keeping such shells and conveying them from place to place, not under peculiar scientific charge, but subject to all the shakings, blows, and other contingencies of military and naval transport. This remark certainly does not apply to those shells which are furnished with a percussive appendage, but they are open to other grave objections. In a shell of this kind some provision must be made to insure the striking of that part of the shell which is furnished with the percussive appendage—a matter in itself of no small difficulty as regards cannon, and which as yet has only been accomplished by departing from the spherical and assuming the pyriform shape in the construction of the shell, under which circumstances the large end will point forward, and consequently strike the object first. Now, the united testimony of practical men is against the employment of non-spherical missiles, so far as relates to every variety of gun, and at long ranges, as being so exceedingly irregular in their flight that their use becomes most uncertain, and defies all calculation. At short distances, however, and especially for sea-service, bar shots are, under particular circumstances, recommended. A small gun may thus be made to project great weight of metal, and thus to acquire a great increase of destructive power.

The remark only applies to cannon, and plain small arms: so far as relates to rifles, the difficulty has been entirely overcome—or more correctly speaking, never existed. An elongated or cylindrical body, properly fitted to the rifle and shot from it, maintains during flight that end forward which first emerged from the barrel, the reason of which is attributable to the rotatory motion it acquires. If then a hollow cylinder of lead, fitted to a rifled barrel, be filled with gunpowder and furnished with a copper percussion cap, or some equivalent contrivance, it will act very efficiently as a percussion shell. Captain Norton has availed himself of the principle, and in allusion to the contrivance, Mr. Wilkinson of Pall Mall, in his work on engines of war, p. 115, states—"I never found one (*i. e.* of these shells) fail to strike on the foremost end, and explode at all distances from 50 to 300 yards. In one experiment I fired at two thicknesses of inch and half elm lined with sheet iron, and containing between them a stratum of four inches of water, the shell passed through the whole at sixty yards' distance, and exploded a box of gunpowder on the other side." It will be seen then, that so far as relates to rifled small arms, there is no difficulty—but rifled cannon do not exist, every attempt to use such ordnance effectively having proved a failure.

Mr. Pasley, many years since, proposed a very safe and ingenious plan for making a percussion shell, the explosion of which was dependent on the fact, that air suddenly compressed liberates heat sufficient to inflame gunpowder. His shells were pyriform, for reasons already mentioned, and a cylindrical cavity terminating at the large extremity of the shell, was partly filled with gunpowder, and closed with a tightly-fitting iron bar, which projected considerably beyond the surface of the shell, but which a sudden blow could force down after the manner of a piston, and thus ignite the powder. These shells were tried at Wool-

wich and condemned chiefly on account of their departure from the spherical form; although it would not be difficult to point out other disadvantages. For instance, the quantity of gunpowder such a shell could hold, would be very insignificant, and the bar would be very liable to get fixed from rust, &c.

We have hitherto supposed that the shell is to be filled with gunpowder, and that a percussive explosive substance, is to be merely an agent for igniting this gunpowder. Gunpowder, in fact, provided we have the time of its explosion under control, will do all that is desired; and if it did not, no assistance nor increase of power would be derivable from any of the chemical explosive agents; whilst the danger to all parties having anything to do with such shells would be immense. Were it our object to speculate on the possible number, and arrangement of chemical substances with which a theoretical percussion shell might be filled, our task would be longer, than interesting or profitable—suffice it to say, that no class of persons expect so little actual advantage from such combinations, in a practical point of view, as chemists, and it would seem that their opinion might claim for itself some amount of respect.

From the remarks we have already made, it will be obvious that we consider the two greatest difficulties, which stand in the way of the percussion shells as fired from guns, mortars, &c., to be, 1. The danger of explosion from the primary shock of the ignited charge; 2. The difficulty of causing any given side of the shell to impinge on an object, except the spherical form be abandoned. A slight consideration will be sufficient to show that neither objection applies to shells which are projected by the force of a rocket—consequently, if those missiles can ever be made to take a more direct course, so as to be more effectually amenable to calculations, the limit to their application will be greatly extended—nay, even in their present state we imagine the percussion shell would, in the event of another war, be for some services, appended to them.

We ought not to dismiss the subject of shells without mentioning a contrivance of most terrible efficacy, which has been suggested. We cannot do better than quote the original statement, *Mechanics' Magazine*, August 18, 1844, which in allusion to Professor Bunsen, thus proceeds:—"He has shown that this liquid of Cadet, consists chiefly of the oxide of an organic radical, or compound base, which has a constitution precisely similar to common alcohol, but in which the oxygen is replaced by the metal arsenic. Thus the chemical formula of alcohol is

and that of the new radical which has been called *cacodyl* in reference to its abominable smell, is

"Now this body possesses the most extreme, and rapid spontaneous inflammability, the moment it is exposed to the air which oxidises it, and forms the oxide of *cacodyl* of which principally Cadet's liquor consists. If, therefore, a fragile vessel of this fluid, say a glass globe, be thrown into the port hole of a ship the moment it breaks against the deck, or any hard object, the spilled fluid is in a blaze, and capable of setting on fire anything combustible in contact with it. But this is not all. The result of this combustion is the evolution of clouds of white arsenic, so that the atmosphere

around becomes instantly a deadly poison! Thus if inflamed between decks the atmosphere would at once be rendered fatal; for it is well known to toxicologists that a most minute dose of arsenic taken in this form into the lungs, is almost certain to produce death more or less speedily. Further, the substance is insoluble in water, and heavier than it; so that water will not extinguish it when on fire. The oxide produced by its combustion, moreover, is a violent poison. It would be difficult to conceive a collection of more formidable properties in one body, or of any more fitting it for an agent of destruction in warfare!" The writer suggests that it might have been the Greek fire, in which supposition we differ from him; although we see no other objections to its employment in warfare except the difficulty and danger of preparing and stowing the material, added to a certain chivalric feeling which cavils at particular modes of death, although permitting others. For our part, we would hail with satisfaction any discovery that could make warfare more terrible, conscientiously believing that the application of such wholesale methods of slaughter would be the surest means of establishing universal peace. We have not the affectation of admiring war—we wish it could cease—but if it must be cultivated as a science, we presume, it, like other sciences, has its theoretical point of absolute perfection—which would seem to consist in the total slaughter of two belligerent hosts. Once render warfare perfect to this extent and men would not fight;—slaughter we take it is the main object of all battles—this granted, it can matter very little whether men are cut in two by chain-shots—perforated by musket-balls—blown to atoms by bomb-shells—or poisoned by arsenical fumes!

ON METHODS OF SUBMARINE ATTACK.

From the very infancy of naval warfare, it has always been an object much sought after, to inflict an injury on an adverse ship under the line of immersion in water. To secure this end the ancient galleys of Greece and Rome were armed with sharp subaqueous beaks, which being driven by the aid of the rowers against an advanced vessel, inflicted the most dangerous fractures and perforations. The genius of naval modern warfare did not admit of the employment of such methods of attack, and it has consequently been long relinquished:—lately, however, Mr. Nasmyth, the inventor of the steam-hammer, has submitted to the consideration of the Admiralty the plan of an iron steamer, bomb-proof, which, (he says,) "will effectually destroy any ship or squadron. She is propelled by the Archimedean screw, and when going at the rate of six knots an hour she will run stern on to a ship, and leave a hole in her many feet wide beneath the surface. It is in fact the power of two ships coming into collision with each other at the rate of ten knots an hour, placed by mechanical means in the hands of not more than three men."^{*}

Still more ingenious was the contrivance of the

^{*} The fate of the sword-fish, which after perforating a ship's side, finds it impossible to withdraw its weapon, and only escapes by its sacrifice, might have furnished a useful hint to Mr. Nasmyth. Granting that he could thus approach a ship and perforate it, he would find himself literally, and absolutely in a fix. But we take it his machine would be sadly hammered about by cannon balls, and sadly interfered with by the ship's boats, long before the somewhat amusing catastrophe could occur.

American, Fulton, who actually devised a boat capable of diving and progressing under water. In the *Annual Register* for 1802, is an account of this diving-boat taken from the relation of Citizen St. Aubin, a man of letters at Paris, and a member of the tribunate, which confirms the inventor's statement of the success of his experiment—"I have," says M. St. Aubin, "just been to inspect the plan and section of a nautilus or diving-boat, invented by Mr. Fulton, similar to that with which he lately made his curious and interesting experiment at Havre and Brest. The diving-boat in the construction of which he is now employed, will be capacious enough to contain eight men and provision enough for twenty days; and will be of sufficient strength and power to enable him to plunge 100 feet under water if necessary. He has constructed a reservoir for air, which will enable eight men to remain under water for eight hours. When the boat is above water it has two sails, and looks just like a common boat. When she is to dive the mast and sails are struck. In making this experiment at Havre, Mr. Fulton not only remained a whole hour under water with three of his companions, but kept his boat parallel to the horizon at any given depth. He proved that the compass points as correctly under water as on the surface; and that while under water, the boat made way at the rate of half a league an hour, by means constructed for that purpose." Vol. XLIV.

However visionary may seem the idea of applying such a subaqueous boat to the uses of actual warfare, Earl Stanhope, (no incompetent authority,) entertained an opinion of the feasibility of the plan; and in the year 1863 he stated in the house of lords, that he had given a plan to the admiralty, a contrivance for protecting ships against such an assailant. It is said that our government purchased the neutrality of Mr. Fulton, fearing lest he should impart his secret to the French, and that in consequence of this bribe he returned to America, and the invention was not further divulged.

The question of the possibility of subaqueous attack by means of a projectile weapon, acquired extraordinary interest during the summer and autumn of last year, (1844,) in consequence of the secret of an invisible shell, claimed by Mr. Warner, and the effects of which were illustrated by him on the John of Gaunt, off Brighton.

Far be it from us to disparage the merits of any inventor, or even by implication to underrate the value of discoveries to which he lays claim; much less would we join that section of a noisy and thoughtless populace, who, without proper means of forming a correct judgment, disbelieve everything they cannot understand. We are amongst those who believe in the possibility of destroying a ship at a far greater range than 300 yards, by the agency of a subaqueous projectile: this is our opinion, which like any other mere opinion, is not infallible, although deduced from many experiments. Such being our views, we regret that Mr. Warner pursued a course of operations which could not but excite suspicion, and which would have enabled him to employ one of several *trickeries* had he so desired. We do not mean for an instant to imply that the experiment was not a *bona fide* one, and that no projectile was used; we have already recorded our opinion that the use of a projectile under the circumstances was possible—nay, that such was not difficult; all we mean to say is this: that the use of such projectile

was not demonstrated, and can merely be received as a matter of faith. Mr. Warner should neither have had the John of Gaunt in tow, nor should he have approached her previously to the explosion. The mere presence of a tow-line would have afforded several means of explosion: it might be made to spring a lock, and thus explode a magazine of powder; still easier might it have been the medium of concealing two voltaic wires, which would have furnished the means of instantaneously igniting a magazine, no matter how far distant. The explosion again might have been occasioned as described by Sir G. Cockburn in the house of commons on Wednesday, July 31.—“He would state *exactly how the experiment had taken place.* He had an officer in a boat close to the two vessels, and the officer distinctly saw the one blow up. A rope with two buoys attached was thrown across her cutwater, the vessel then going at the rate of about three knots an hour; these two buoys, by the impetus of the vessel, were forced under water, and the tension of the rope attached to them either struck a hammer or excited by other means the igniting power, and then the vessel blew up.” The officer who had reported to him said, “he considered that the explosion was the effect of two barrels of gunpowder.” M. Jobert of Brussels, suggests that a congreve rocket headed with fulminating mercury was the missile employed—fired on a level with the water’s surface. M. Jobert could not have tried the experiment—a rocket under these circumstances sinks almost immediately on touching the water—besides its flight must have been visible. It is our opinion, however, as the result of some experiments, that a purely subaqueous missile can be constructed—safe in its use and easy of application: more than this it would be premature at present to state.

CONCLUSION.

The task originally proposed to ourselves, draws near to its conclusion. During many periods of its progress, our regret has been that several interesting documents bearing on the subject, must be so summarily dismissed. The mere change of form and power which arms of all kinds have undergone, is in itself a matter of great interest;—when taken in connexion with the states of society which called them into being, the interest is greatly enhanced. Clubs and wooden spears are emblems of savage life—of men scarce a step removed from the prowling denizens of the forest. Bows and slings are symbols of a higher grade—of men whose minds have begun to expand and grasp the first principles of mechanical science. Great was the advance made in the art of war, when the arbalest was discovered; greater that which prompted the construction of the vast artillery of old—the aries, the balista, and gigantic catapult! Now wealthy cities rise before our view—with walls and lofty towers—war is no longer carried on with the petty rancor of individuals, but as the agent of facilitating some great, perhaps laudable policy. Greatest of all was that advance consequent on the application of gunpowder:—no longer do we trace the mere progress of the art of war—no longer are we the mere narrators of the flights of missiles and the terror of their effects—we become insensibly carried away in the torrent of a great political revolution! The discovery of printing, the mariner’s compass, and of gunpowder, are referable to nearly the same date—agents of equally revolutionary power it would be impossible to suggest; and it is difficult,

at this epoch, to say whether the first or last has been most instrumental in altering the constitution of society. Amongst other consequences resulting from the use of gunpowder, we may especially enumerate two. The claim of might is more likely for the future to reside with those who have the better claim of right—with the best educated, and consequently most enlightened states. Brute force now avails but little in modern warfare, science being all in all. The discovery of gunpowder, again, has greatly tended to the decline of feudal sway. So far as relates to the chances of danger, there can be no longer a privileged class of warriors, whom swords may smite and arrows strike in vain. No doughty knights smothered in buff coats and iron plates, figuring during peace in harmless fray; begetting a spurious sentimentality in the bosoms of our daughters and our wives, yet incapable in actual fight of being injured, and often, from their unwieldy arms, of injuring others. The time for such vagaries, thanks to the villanous saltpetre and its black offspring, gunpowder, are gone. None who now go into battle can claim immunity from danger and death; some whizzing ball, some blazing shell, or erring rocket—all very indifferent respecters of personal dignity—may come and lay a general in the dust, no less than the humblest drummer!*

We really beg pardon of the ladies for thus slightly alluding to their friends, the knights of old, with whom they have associated such ideas of romance. But on the first introduction of fire-arms they certainly *did* quake and complain much more than men so brave by reputation, and so petted by fair ladies, should have done. They guarded themselves too by such unwieldy mail from the annoying bullets, and must have looked so grotesque—so ungainly, whilst their poor steeds shuffled forward to the charge, groaning and snorting under the unconscionable weight of their riders, that we are sure, had our lady-friends seen them, their feelings would be more allied to mirth than chivalrous love. Then, what a most unromantic death was it to be cracked to death with a sledge hammer, like a huge lobster! But we do not wish the ladies to feel any other interest in warlike pursuits save the very proper one of regret at the existence of such an evil. We object to that exhibition of mock valor, and that mawkish, silly sentiment which the system of tournaments long kept up; therefore we trace, with peculiar satisfaction, its downfall to the introduction of fire-arms. Such are our feelings on the subject, though the ladies may call us a Goth!

Before we finally lay down our pen, we may observe, that of late it has seemed necessary by many individuals to treat all arguments concerning mysterious projectiles with much acrimony of spirit. It would even seem as though the whole subject were inflammatory—only to be approached in a passion. We have endeavored to be civil and just; if, however, we have on any occasion seemed too energetic, or too personal, we beg the reader to attribute the defect to an error in our temperament,—not to a studied design.

* The equipment of knights and their men-at-arms was totally unadapted to the genius of warfare, after the employment of small fire-arms had become general. Each man-at-arms ought to have *five horses*, one on which he rode to the charge, and hence called a charger; the others to carry his trappings, and to bear him on the march. Some attempt was made in Germany to diminish this unwieldy retinue by allowing each man-at-arms only one horse, but a wagon to every twenty men. See the *Arte of Warre of Machiavelli*, translated by Peter Whiteborne.

From the Edinburgh Tales.

GOVERNOR FOX.

BY RICHARD TAYLOR, ESQ.

THERE is one corner of a newspaper which never escapes me—no, not in the broadest, closest double-sheet, put forth after a long debate about pensions and sinecures. During a money panic, I may chance to look first at the price of stocks—and, pending a Westminster election, glance at the latest state of the poll; but sooner or later I am sure to return and pore over the obituary. Some of my friends say this is a symptom of age creeping on, something like an old lady buying a new "Practice of Piety," in a print a size larger than is required by her present spectacles. I only know that the obituary is to me a column which at all times teems with grave, yet not unpleasant histories. There I see my old acquaintances, slight or intimate, and long lost sight of, for the last time. We meet once again to part in peace, and forever. No man indulges harsh or unkindly feelings in perusing the obituary. This column, with which the newspaper moralizes its motley pages, is to myself as productive of musing contemplation, as a saunter, backwards and forwards, beneath the elms of some antique and rural church-yard, in a June evening—when the rooks above have settled for the night, when the curfew has ceased to toll, and the fantastic, flickering shadows cast by the sunken tombstones, are fast vanishing from the grass.

I could not exactly recollect whether it was to my young friend Walpole, with whom I sat, that I owed my original acquaintance with Captain Stephen Fox, or if I first saw him as the client of my brother James: but I well remember the circumstances which taught me to revise my hasty and unfavorable opinion of the tough old governor. Had I known him only in his capacity of client, his death, in the obituary of a provincial paper, would scarcely have drawn from me the half-suppressed *acheu!* with which I met the likeliest piece of intelligence in the world—that a strong-willed, hale man, of nearly fourscore, full of vitality, and resolute upon living on for another ten years, had nevertheless been compelled suddenly to submit to the common lot, all his plans unexecuted. One thing remarkable was the list of legacies appended to the notice. These were out of all keeping with the character of the bequeather;—but this might be the effect of a fit of death-bed remorse.

My young friend, who, from various circumstances, felt even more interest in the event than myself, had thrust the newspaper into my hand, pointing to the notice—saying, in a slightly tremulous voice—"See here! Poor old fellow! He was, with all his queernesses, a sound-hearted man, and the friend of me and mine, when a friend was of more value to us than now."

I now perfectly recollected where I had first seen the old Governor. It was at a funeral, where the gentleman with whom I now sat, then a boy of six years, attended as chief mourner. I collected the grayish tint of the sky, and the color and smell of the Thames, on that day, when nature appeared in her pensive, half-mourning weeds, as I hurried on from London to Rochester in the stage-coach.

"This is quite a duty to your mind, Richard," my brother had said. He wished to make me his

deputy. "I have some touch of a flying gout to-day, and am, besides, to tell the truth, so plaguily busy at this opening of the term. The undertaker will, of course, do everything in the best manner; but the Walpoles are not persons to be neglected—and I shall like to be able to write to Northamptonshire, that, though indisposition prevented me from attending the funeral, *my brother* had seen every proper attention paid to the remains of Lieutenant Walpole, which became his birth and family."

"His *remains!*—could nothing have been done for the animated body? Is he the same poor young man I saw lately at your chambers?"

"The same, poor fellow! He was severely wounded in the affair of Alkmaer, and brought into Chatham. There is a poor widow, too, who posted down to meet him, and one or two children. It is a melancholy story—but Anne will tell you all about it. I have no time—only my instructions from Sir Hugh Walpole's steward, are, that the funeral be conducted in the most respectable manner; and that the death be properly, but simply announced in the *St. James' Chronicle*. Will you attend to that too?"

"And the young widow, and the two or three children?"

"O! I have no orders about them, I am sorry to say. Walpole's was some foolish love-match, I believe."

There was no time to lose. I put myself into my half-worn suit of solemn black, and, declining the proffered chaise, which I then conceived a robbery of the widow, reached Rochester by a common stage-coach. The whole scene, though past for twenty-three years, instantly revived to my memory, with its principal actors, Governor Fox and the little weeping boy whom he led in his hand, with the bit of rusty crape tied over the sleeve of his blue jacket. That boy was now transformed into the gentleman opposite to whom I sat.

On this particular day, as Walpole vowed he did not know what to do with himself, I had consented to dine with him *tête-à-tête*, to survey his new house which he had just entered. He was at the high-top-gallant of his joy, in the way of making a rapid fortune; and within a few days of marrying my third, and it is said favorite niece, Charlotte, for whom he had, in the ladies' phrase, *proposed* three years before; and who, if not absolutely denied his hopes, had been *prudently* withheld. I had been a kind of half-confidant of their attachment—my latent romance a qualifier in their behalf of excessive parental prudence.

"I shall begin to believe what you old folks say of the brevity of life," said Walpole. "Looking backward, 'down the vista of time elapsed,' to that funeral service in Rochester cathedral, the distance appears so mere a span—yet it is full two-and-twenty years since—older than Charlotte."

One way or other we were disposed to become very social and communicative on this particular afternoon. The verge of the new life upon which he stood, was to Walpole a point of 'vantage, from which he could look back with complacency on the rough, up-hill track he had traversed in storm and calm, in sunshine and shadow; with many changes of fortune, but ever, I believe, with a hopeful and unflinching spirit. Prominent before him, in every early stage, stood the image of the old governor, whose oddities and humors were but so many incrustations to which the pre-

dilections of friends might grow and cling the faster.

"Poor old fellow! I hoped next week to have given him the pleasure of seeing Charlotte."—There was too much *Charlotte* in our talk certainly for good taste; but in a bridegroom an uncle might forgive it, especially when the bride was his favorite niece.—"I thought he would have weathered out a few more winters! for, except the load of nearly eighty years, and a touch of deafness, which made him only more pleasant by making him more testy than before, there was not a symptom of vital decay about him. Here is a letter of his not yet five days old, written with his usual brevity; but every character as sturdy, firm, and right-angled, as his best official despatches forty years back.—Many of them, I warrant me, lying in the Colonial Office still unopened. Well, I owe him a libation, any way. Here's to the memory of Stephen Fox! in the liquor he loved best—sound old port."

"I should not have imagined port an African governor's favorite drink."

"He had lived long enough in England for it to have become so.—You know, I presume, that Governor Fox rose from the ranks. The Ishmaelite took great pride in the circumstance that Stephen Fox owed no favor to any patron."

"I know that, and much more good of him."

"For example, that it was not his fault that I, your nephew-elect, am not a Northamptonshire squire, lord of three manors. Even his kindness I owe to her to whom my friends may trace whatever is bearable about me—to my poor mother."

Walpole was in the fair way, in his mixed mood of a gentle sorrow tempering full-blown joy, to an overflow of heart. It is so rare in these highly civilized times for one man to let another have a peep into his breast, that were the confidence fairly given, though by a shoe-black to a prince, such is sympathetic human nature, that I believe it would be prized.

"Did you ever know that I had been an author in my time, Mr. Richard?" he went on.

"It is rare to meet with a man under thirty who is not—but I was not aware of your initiation."

"I am one of you however. Re-wrote three formidable pamphlets or memorials to the Colonial Secretary, setting forth ten thousand abuses connected with that African sovereignty; and, before I was sixteen, *grinded*, and partly *top-dressed*, the Autobiography and the Opinions of Men and Things, at home and abroad, of Stephen Fox, Esq., Captain of Marines, and Governor of that abandoned fort, which he conceived of more importance to Great Britain than all her Eastern and Australian colonies taken together. To the abandonment of that pitiful pin-fold, kept for British soldiers to rot in, and the abolition of the slave trade, he imputed the enormous increase of the national debt, the power of Napoleon, and all the disasters of this country.—My dressing spoiled his story, I have no doubt. All self-taught persons, as the best educated men are often called, tell their own tale best; but though he affected to despise Greek and Latin, he had the good stupid old English veneration for scholarship:—as if his own pithy mother-English had not been twenty times better than my raw, pedantic, dog-Latin style."

I confess I relished more such racy morsels of his own story, as I had from time to time heard

the governor relate, *visa voce*, than the elaborate narrative polished by young Walpole, which it had cost its hero many years of his later life to add to and revise, when he had become so deaf and cross, as the Chatham Ladies said, that no soul in Rochester, Chatham, Brompton, or Stroud, or the regions thereabout, however devoted to the four aces and the odd trick, would sit down to a rubber with him.

When I first saw Governor Fox he must have been near sixty. He had returned to England but six months before, and had plunged himself into twice as many lawsuits about nothing. He seemed, at the period of his return, taken altogether, (though there was a touch of the sea about him,) the hardest, most angular, and bristly specimen of the old unmodified domineering soldier of the German wars, that I had ever coped with; and I confess a latent prepossession against the whole class—so different from the enlightened and liberalized modern soldier, whose profession has thrown him into the exact line of the "march of mind" and the conflict of opinion; while civilians either remain wrapped up in their original prejudices, or get rid of them much more slowly.

There was nothing very remarkable in the early history of the governor. It was his pride to tell that he was the son of a miller, on one of those Northamptonshire manors which belonged to the Walpole family, and that he had been on the world, his own master and provider, from eleven years of age. His manner of abandoning his home was quite characteristic.

"The old fellow," he would say, "had seven of us, sir, you observe; and when the poor woman was carried off by fever, he could not easily do without a housekeeper—the curate told him so on the day of the funeral. But that was no reason for bringing home, in three months, a snivelling jade from Peterborough, good for nothing but bearing sickly brats and drinking tea, instead of a hearty, motherly countrywoman, who could have known the gage of his boys' stomachs, and kept their shirts clean."

It was in this respectful manner that the governor spoke to Mrs. Walpole and myself, of father, mother, and step-dame; and his small, gray-green eyes would twinkle with roguish malice, when he told us, that after being half-starved, and often beaten by his mother-in-law, his father was one day persuaded by her to flog him, for breaking some favorite china tea-cup, and that for this he took the glorious revenge of smashing every article of crockery she had brought to the farm-house, before taking flight from the paternal roof forever. He had fled across the country, and got to the Suffolk coast. From thence, in a ship to London, and thence again to the uttermost parts of the earth. He was, at least, no more heard of in Northamptonshire for above thirty years of hardship and adventure. In the course of that time, he had been first ship-boy, and then private, corporal, sergeant, lieutenant, and captain of marines; but it so happened that he had never visited England. His stations were the West Indies or the African coast; and, for a long time, he had been doing duty in New South Wales. The governor's early years had not flown on wings of down. I am, indeed, afraid that a ship-boy in a British merchantman is often one of the veriest slaves on earth. "Nothing good about it, sir," the governor would say, "but the peas soup, and allowance of salt junk, when stores were full.—I knew something about my book while at home

in Northamptonshire, and could have answered, 'Who gave you that name?' 'My godfathers and godmothers,' and such like; but all religion was forgotten at sea. It was not till I was corporal, a tall fellow of twenty-one, that I took seriously to my learning. I saw by the Scots, that there was no getting on without it."

The governor had never taken doggedly to any one thing in his life, without making something of it, either by fair means or violent, were it but repairing the pathway, or watering the road to Chatham. He owed his first commission to a sudden mortality among the troops, which carried off the seven officers of the party, and left Sergeant Fox in chief command of the fort, of which he, twenty years afterwards, became the governor. It was bravely and skilfully defended by the sergeant and the few remaining marines fit for duty, when suddenly attacked by the insurgent natives, who had learned the sickly state of the garrison. The commander-in-chief was so much pleased with the courage, promptitude, and judgment, displayed by the sergeant, and by the clearness and brevity of his dispatches, that he was at once commissioned.

"It was all my *luck*, sir," he would say, "that Abercromby happened to be chief in command then. Had it been—now, why I might have rotted out in the service as Sergeant Fox. Yet Abercromby was a Scotsman, and—a countryman of my own.—I am not partial to the Scots, sir. Too many of them have lately got into the marine service—far too many of the hungry rascallions come here to eat up Englishmen's bread and beef; but, as poor Ned Walpole would say, that young chap's father, 'the Scots are like water-melons, nineteen you may throw to the pigs, but the twentieth is a fellow to make your mouth water.'—Sir Ralph was one of the twentieths, sir."

This is a faint specimen of the talk of my old friend the governor. The Scottish nation were not singular in his bad graces. He was, indeed, qualified to gain the full love of Dr. Johnson, as a most energetic and thorough hater. While abroad, he had hated Jews, Frenchmen, Scots, and Irish, but, above all, the Americans—the Yankees. He was also rather jealous of the naval service: but the military was the object of his peculiar disgust. Indeed, half his dispatches and memorials went to prove the entire uselessness of troops of the line and cavalry: seamen alone—the wooden walls! with well-appointed marine corps, being all that was needed for the defence of Old England and her colonies.—The general name, Great Britain, was one the governor never would recognize.

After his return to England his hatreds remained undiminished in force, and increased in number; but their objects gradually changed, exactly as did the external relations of the governor. In a few years, people said, he was no longer the same man; but he was the very same individual in a new position. By the time I enjoyed the pleasure of his acquaintance, among the numerous objects of his spleen were the Colonial Secretary, with every individual connected with the colonial department; the anti-slavery party, and especially their leaders, with the ladies, he called the she-saints. On these ladies he poured unmitigated wrath.

Governor Fox had also many minor and individual objects of detestation, such as the Baptist

druggist, who opposed him at vestry-meetings, the numerous brood of Northamptonshire Foxes, let loose upon him as soon as he returned home with a fortune. As no one could tell the amount of that fortune, every one was at liberty to guess, and to fix upon the scale best fitted to his own ideas of the wealth and magnificence, corresponding to the dignity of Governor Fox. It seemed to cost him more trouble to defend his pocket from the real and imaginary attacks made on it by "this greedy pack," as he styled his numerous relations, than his fort and government from the natives, of whom he spoke with much greater respect and affection. This government he had abandoned in a hot fit of ill-humor, because, during the short administration of his namesake Fox, at the beginning of the century, he had been privately admonished concerning his arbitrary, if not oppressive, dismissal of a Wesleyan missionary from his station, whom he threatened to tar and feather if he ventured to approach the colony again. And the governor would have been a man of his word.

Home he came, after an absence of fifty years, in a hissing-hot fit of tropical rage. "Those Whig fellows," he said, "were all Bonaparte and Wilberforce men. They would destroy all subordination and good government, and play the devil with Old England. They had done so already.—What a pretty place they had made of Northamptonshire! everything turned topsy-turvy there; and one Peel, a spinning-jenny fellow, in possession of some of the finest manors in Staffordshire and his own native county."

But I have not yet got to this chapter. Nothing at this time could irritate the governor more than being supposed a humble cousin of the Holland family, save being questioned on his probable descent from George Fox, the founder of the Quakers. "I'm a whelp of a better litter," he would say;—angry perhaps—such is human nature—that he was not able to reply in the affirmative.

Yet with such ideas in 1806, I lived to see the governor, under the combined influence of shrewd common sense, a strong, unperverted, however unenlightened, love of justice, and a splenetic temper, fearfully aggravated by his long residence abroad and the habit of absolute command, become a staunch Reformer, in all save the name. It might have helped to sharpen his scent for abuses that he no longer profited by them in any shape. It became his boast, "that Stephen Fox, though a man of fifteen stone, did not add one ounce to the *dead-weight*." He had sold his commission, and, for a wonder, drew no retired salary from his abolished government. He was, therefore, free to grumble and complain of everything, as fast as one grievance was found out after another, from his excised cigar to his taxed pipe of Madeira. It was amusing to me to watch the stages the governor made on the high-road to the grumbling state, often nick-named Radicalism, sometimes slowly, sometimes by a great kangaroo leap; as in the affair of his property-tax, an impost then so arbitrarily levied.

The OLD ENGLAND to which Governor Fox had returned, did not in the least resemble the Old England of his imagination; the England which, prosaic as he was thought to be, had haunted him under the torrid skies of Africa, with visions of cool green lanes, open breezy downs, and driving his mother's cows at dewy dawn to the village common.

This desired land to which he came back, was not even the Old England of recollection. The governor's first experiment was made, in Northamptonshire, in the scene of his childhood; and it proved a complete failure. Ten years afterwards he related the adventures of his journey to me, with fire and fury in his eyes:—

"I pitched my tent in the *New Royal Oak*, sir—for the *Oak* itself was down every stone of it—and the buxom landlady, who often, when I carried her eggs from the mill, went to give me a good hunch of home-baked bread—*home-baked*, you observe, well buttered with lard—had gone the way we must all follow, sir;—for some time I took my Christian name of Stephen—Mr. Stephen, a gentleman from foreign parts, looking about him. I wished to reconnoitre the Fox earths, you observe, without putting 'em all on the scent after 'the grand governor, their cousin, and his Indiey fortin.'" The governor had a spice of English humor about him, though his rage or hot choleric often dried it up.

"Old England has been on the quick march since you went abroad, I guess, sir," quoth my puppy landlord—"you must see great changes and *improvements* in the village, Mr. Stephen!"

"Quick march to Old Nick, man—with the Whigs, drumming her on.—The fellow did not mean to tell me, Mr. Richard, that the poor cottagers who grazed their cows on the common are a fig the better for yonder new cake-houses, filled with the bull-frog farmers, and their ladies, forsooth! and the small Esquire puppies, with their belts, clumps, and circular sweeps.—A great change, quoth he! To be sure I did see that:—English laborers wearing cotton-rags, meaner than the convicts' slop-clothes at Botany Bay—and their dames slopping at treacled bohea. A great change, truly! An empty rectory, sir, and a full Methodist chapel—cottagers' dwellings fallen to ruin, and a big workhouse erected. Not a spot of ground on which the poor man dare set his foot; and their common divided among thieves;—a good slice to the Lord of the Manor, but a better, I'm told, to his steward.—A great change, forsooth! Rents doubled and tripled:—yet every other estate eaten up with Jew mortgages, and wheat at 4*l.* 10*s.* a-quarter!"

In short, the governor had been displeased wherever he went, and with everything he heard and saw; but especially with his rapacious kindred, to the tenth degree, whom he styled "worse than the blood-sucking vampires of Surinam." From some marine predilections and old friendships, he had originally fixed his head-quarters at Rochester, to be near Chatham; and thither he returned from Northamptonshire, quarrelling with every soul he encountered at home or a-field: with turnpike-gate keepers, guards and drivers, overcharging landlords, and a new, unknown species of greedy animal, called *Boots*. On the road his testy temper and mahogany complexion obtained him credit for being an American on his travels; a mistake enough of itself to have provoked the governor to do murder. "A true-born Englishman could not, in these days, be known for one in Old England!"

At home Governor Fox appealed against every tax-gatherer, and from all manner of impostures and surcharges. He had one lawsuit about the right to a pump in the stable-yard; and another about the party-wall which divided his bit of garden from the premises of the Baptist druggist.

His tailor cheated him in buckram and broadcloth, and he first swore at him, like his namesake, frugal King Stephen, and then kicked him out. The tailor very properly "took the law of him." His housekeeper was saucy when he gave orders, or looked into matters unbecoming the munificence and dignity of a governor whom *she* served, and he would have dearly liked to kick her too. His laundress was unpunctual, because she washed for the gentlemen of the *line*, who were often in a hurry to embark; and in free Old England, of which he had so long boasted, it was neither thought seemly to flog a scullion-wench, nor yet the frequent custom to kick even a tailor.

The governor had been too long habituated to a summary redress of domestic grievances, not to make repeated attempts at introducing tropical discipline into his Rochester household, for its more speedy and effectual reform. This produced endless actions for assault and battery, and prosecutions for the recovery of wages and board. Now it was the cook gave warning, and went off on the third day, just before dinner; now the chambermaid "would have his honor to know *she* was not to be *served* like his black niggers!"

On one occasion he was left alone in the house with Black Sam, a negro-lad he had brought home. Sam had grown up with him from a very young boy; so to him he made, on the whole, a kind master, notwithstanding a little occasional African discipline. He had taken considerable pains with Sam's early education. It was the governor himself had taught him to polish boots to perfection, groom a horse, keep his teeth and nails clean, and repeat the creed.

The three days in which the governor and Sam were alone in the house, were, on the whole, the most tranquil he had yet known in England. He contemplated living in future merely with Sam, and a groom lad who slept out, and letting "no saucy jade, with her teapot, and her hair-papers, ever again enter his door," or female of any kind; unless some of his nautical friends, who made trading trips to the Coast, would bring him over a handy negro-wench, about eighteen; whom he mentally proposed to marry to Sam, and thus raise a breed of *niggers* for the home supply. The only obstacle to this scheme, was his frequent purpose of turning his back upon Old England, its taxes and fogs, its paupers and pampered servants, altogether, and returning to Africa; which he probably would have done in a fit of spleen, save that his funds were now locked up—in one or other of the many "profitable investments," that had, by this time, been recommended and urged upon him—and could not easily be realized.

I do not think the governor could have been avaricious while he enjoyed power; but in Old England, like every other man, he soon found that next to power—great power—and superior to rank, is *money*. If he had previously ever liked money, it was negatively, not positively. At the beginning of the French war, and in the end of the American war, he had made considerable prize-money. He took no pains to increase it. But as he never spent,—and, at his Coast Fort, was neither troubled with needy cousins, blood-sucking tax-gatherers, tailors who cabbaged broadcloth, nor smart housekeepers who liked their masters to have things handsome about them, his fortune had imperceptibly accumulated. Still he never spent. The housekeeper and cook had been forced on him by the Chatham ladies, who liked to patronize as

old rich governor, and to assist in his household appointments, because he "was such an acquisition to the neighborhood!"

The governor, of all human things, abhorred and despised a spendthrift, next to a dirty woman, a drunken marine, a negro in a state of perspiration, or a lady carrying about a subscription-paper for a religious charity. A man who outran his means was a knave, and dishonored; and there was no more to be said of him. No indulgence, no sympathy, for the poor subaltern who got into difficulties. "The puppy, sir, knew his means," said he to me, in reference to a poor lieutenant, with a sickly wife and three or four children, who was known at this time to be in great distress in an adjoining lodging.—"A man sir, may live *handsomely* upon a shilling a day; *comfortably* upon sixpence. I have done with less."

This was always conclusive. "The man who is a slave to his belly or his back—or to the vanity of some silly hussy he may have married, must drink as he brews. I don't know how it is with those who buy and sell; but I know this, that I never wish to see any man my debtor, for from that moment I am tempted to hate and despise him. I cannot feel for him like a Christian—he seems meaner than a *nigger*."

With these ideas, the governor, ever since his return, had been looking about him for what moneyed capitalists call a profitable investment. With all his natural shrewdness, a great deal of simplicity and no small portion of credulity were mingled in his character, which laid him open to the designing. From the many "profitable investments" he had made, several fortunes were to be realized. One large fortune he was making, by shares in a brewery of Scottish ale, made at Rochester, for the London market; another was to arise from shares of a commercial speculation to South America; and a third, more singular still, by shares of the Drury-Lane Theatre! Each concern was of large promise; but, in the mean while, another lawsuit was on the *tapis*.

On the fourth day of the joint housekeeping of Black Sam and his master, the governor, before walking to Chatham Barracks, his ordinary morning promenade, gave his orders for the day: dinner punctual at five, a sole, a curried chicken, and turnatas. He was not absolutely sure whether Colonel Bamboo of the marines would mess with him that day or not: but, at all events, a couple of chops in addition would do the thing well enough in a bachelor way, with a bottle of his East India Madeira. This last was a lure rarely resisted by the retired *militaires*, with whom he daily conferred on the bad conduct of the war, and the important aid the marines lent to the regulars, who deprived the amphibious heroes of their laurels.

Colonel Bamboo, having no other engagement, accepted the invitation, as it was indeed a hundred to one that he would unless he had had a better. I happened to be that day in Rochester on business connected with Mrs. Walpole's endless Chancery suit; and the governor had reasons of his own for being civil to his solicitor's brother; and, besides, "abhorred fellows devouring widows' substance like Methodist parsons," especially that of the "Widow Walpole," or "Ned's widow," for whom he had conceived a high respect. In brief, to spare her couple of mutton-chops, as he considerably supposed, he introduced me to his friend, Bamboo, and frankly vouchsafed me a

share of the *currie* and the *sole*. We walked towards the snug box, for it was no more, occupied by the governor, who meanwhile studied Robins' advertisements, and sometimes had visions of an estate and a mansion in Northamptonshire, as soon as the Scottish ale and old Drury had laid their golden eggs.

No Black Sam appeared to the master-knock of the governor, who became apprehensive that his trusty major-domo might have been taken suddenly ill. Failure in punctuality was quite out of reckoning with the governor.

"We never have any accidents," was his reply to Bamboo's suggestion. "I never allow accidents. Something must have bedevilled Sam."

Governor Fox was essentially a humane man,—if my readers can reconcile humanity with the exercise of moderate flogging. I do not mean to say he was a man of quick sensibility, or of any delicacy or refinement of feeling; but he could sympathize with cold, hunger, filth, the ague, and the dry colic—for these ills he had experienced himself—ay, and do more for the relief of the sufferers under them than persons of far finer feelings.

Neither cold, hunger, nor ague, could be suspected here; so it must be the other case. And, by the help of Bamboo, the governor scaled the wall with surprising agility, to make a breach by the back-kitchen. While he was thus engaged, in fingering about the latch I chanced to find it open, and accordingly advanced with Bamboo from the front so as to encounter the party that approached by the rear. What was the governor's rage to find the sooty object of his recent solicitude, his frizzly hair greased and powdered, and his person decked out in his holiday frilled shirt and scarlet waistcoat—not dead drunk—an African seldom is so—but intoxicated to the pitch of madness, strutting about the kitchen, his arms extended, and his eyes rolling, spouting

"Slaves cannot breathe in Hengland!"

The scene was irresistibly ludicrous.

"You confounded black rascal, what have you been after! Are you drunk, you villain!"

"Yes! me drunk, Massa Gubernor! Glorious drunk!" cried Sam. "Me no black rascal; me free nigger!—free as Massa Gubernor, or Massa Colonel Bamby—"

"Slaves cannot breathe in Hengland!"

I feared the governor would have choked; he became black in the face. "You cursed impudent negro dog, who has been putting this rebellious stuff into your woolly head! You shall find, you villain, that slaves can both breathe and howl in England. Where is my whip?"

"In de lobby, massa," cried the blubbling, terrified black, from the mere spaniel-like instinct of obedience. "Oh, Massa, Massa Gubernor, no flog, no flog your—*slave!*"

The scene became painfully mixed with the ludicrous and the pitiable. I had as great an antipathy to the phrase *your slave* as Matthew Lewis himself—as great a horror of the scourge as any man—as dejected a spirit to find the heroic resolution inspired by the new-born sense of freedom so easily cowed in poor Sam. It was scarcely to be expected that the governor would spare the rod upon this occasion; but his rage ran too high to allow his punishment to be very effective. The

length of the driving whip, with which he administered discipline, made it recoil, and coil at every fresh stroke round his own person; while Sam skipped, and leaped, and screamed about, with little or no corporal damage, however his new-born notions of personal liberty might be outraged, until the governor was fairly blown by the unusual exertion. Colonel Bamboo held it as a point of honor not to interfere with a gentleman's right "to wallop his own nigger," even though Sam had not richly deserved a flogging by neglect of the sole, the currie, the lime punch, and other et ceteras.

The result was, that the governor dragged and partly kicked Sam into his usual lair, turned the key upon him, refreshed himself and his friends, after his fatigues, with a rummer of Madeira and water, and, like an old campaigner, making all safe in garrison, locked the door, put the key in his pocket, and took his way with us to dine at the barracks' mess, where we were sure of a welcome, and for which there was still time.

It was but three or four days later that I saw the governor arrive at my brother's chambers, in a towering passion, vowing, with a deep imprecation, that if he spent his last shilling of ready money, and sold out his Drury-Lane shares, he would have justice on the canting, snivelling, hypocritical Methodist scoundrels, who had first put such rebellious notions into the head of his *slave*, then broken into his house, and now wanted to deprive him of his *property*.

Sam, after we left the house, instead of sleeping off his liquor as his master had intended, had been overheard bellowing in his half-drunken state by the neighbors, who, in their zeal of humanity had broken into the house and freed the captive.

The case was warmly taken up by certain persons more distinguished for zeal than discrimination, and particularly by the vestry opponents of the governor. Black Sam, therefore, enjoyed the felicity of being, for a few days, the talk of many tea-tables, and the guest or lion of a few. He was represented as the son of an African prince, inveigled, when a child, by the governor, into the fort, and made a slave, while his parents were massacred. Though Sam was rather an honest fellow, and at bottom warmly attached to "Massa Governor," he had not heart all at once to strip himself of those imputed honors of birth, or to deny that he had been cruelly kidnapped from his royal parents.

My brother's endeavors to prevent a fresh suit, upon account of Black Sam, were quite thrown away. The governor swore he would have the *ascal* back, were it but to make pie-meat of the ungrateful, rebellious *nigger*, if there was any justice or law left in England. If Mr. James Taylor would not take up the case, why then another would. There was, thank God, no scarcity of attorneys in London. The fact was undeniable.

The case gave rise to several amusing scenes, particularly when Black Sam and the governor met face to face at parties in court. So strong was the habit of slavery in the subdued soul of the poor, trembling African, that he could scarcely be primed to meet the terrible governor at all, but never once to confront him manfully; while it required the utmost vigilance of his counsel, and his friends, and a hundred warnings about the dignity and sanctity of the temples of justice in England, to impress upon the governor the necessity

of restraining himself from inflicting punishment on the black hide of "that ungrateful scoundrel Sam," in open court. The array of "*she-saints*," who appeared as spectators, exasperated him still more. He tried to affront them to their faces, by asking aloud of Bamboo, who stood by him, "What all those ugly hussies wanted in a court!—had they no work at home—or had they taken a longing for black flesh, like the unnatural woman in Shakspeare's play, which he had seen acted at Kingston!"

The unkindest cut made by the champions of freedom, in the person of Black Sam, was compelling Colonel Bamboo to bear witness to the flogging. Every military gentleman who heard of the circumstance, declared it a d—d unhand-some proceeding, to compel a gentleman to so flagrant a violation of honor and hospitality. Bamboo managed with great delicacy and tact, and gave the governor a flaming character for humanity, which, in the instance of Black Sam, I rather believed he deserved. Governor Fox was, he said, remarkable for humanity to all his negroes—he had been known to administer their medicine himself, and to attend the hospital, in the meanest offices, when the soldiers were too sickly to do duty.

The governor got rather well off, in short, though he considered himself the worst used gentleman that ever had claimed justice in an English court. For "was not Sam his born slave! and was not the nigger declared as free and good a man as any white Christian!"

This unrighteous decision, with a swingeing sum of costs, made him a more determined hater than ever of all Baptists, Methodists, Quakers, and *she-saints*—the last class, in particular, were, from this date, his mortal antipathy. But Old England, herself, sunk still farther in his esteem. She was become a land fit only for *tax-gatherers*, pensioners, and canting Methodists. He would go back to the West Indies! A few retired veterans, and families of military, or West India connexion, warmly joined the faction of the governor, and the neighborhood was kept in hot water between the slavery and anti-slavery, the evangelical and the church party, who, to say truth, had, on some points, very little Christian charity to divide between them.

It afforded a great triumph to the governor, about three months after Sam had been rescued from his tyrannical grasp, and declared a free man, to find the poor fellow in rags, begging on the streets of London. He had just been dismissed from an hospital. The poor creature would have been most thankful to be restored, on any terms, to his old quarters; and as those of the governor, though they implied complete slavery, said nothing about half rations or flogging, he was delighted to return *home*, as he called the governor's dwelling.

On a Saturday night, therefore, the governor, who liked this kind of duty, saw Sam duly scrubbed, and well-soused with divers buckets of water, administered by the groom, at the same pump about which the lawsuit was proceeding, and his rags burned in the yard; to free him, the governor said, "of the vermin he had gathered among the saints." Next morning, piqued into making Sam as good a Christian as they could do for their hearts, he strictly examined him, himself, on the creed, and enjoyed the triumph of telling a military chaplain, that, "With all the canting of the

Evangelical fellows, Sam, in the three months he had been among them, had been so much neglected in his religious principles, that he committed more blunders in repeating his creed, than when he was only ten years old; though he pretended the old ladies had taught him to pray off book."

Sam submitted to be paraded before the windows of some of his late emancipators, with a legend about his neck, bearing that he, Sam, a black man of the Sow-sow nation, was the born slave of Governor Stephen Fox!

For some weeks Sam's master and he went on tolerably well together, until it was discovered that Sam, who was socially inclined, sometimes, when the governor dined at Chatham, stole out to a prayer meeting. This was crime enough of itself; but a waggish ensign informed the governor that his own servant, who was also an attendant, told that Sam publicly prayed every night, "That Goramighty would hear the poor nigger's prayers, and have mercy on the sinful soul of poor, ould, wicked Massa Gubbana; and not send him to the bad place."

If not held back by main force, the governor would certainly have gone forthwith, and dispersed the alleged conventicle by the use of his cane. As it was, he vowed he would break every bone in the black knave's carcass! Pray for him, indeed! Him, a white Christian! Was there not bishops and rectors enough, well paid, too, in England, to pray for churchmen; but Methodists, and niggers, and she-saints must have the impudence to pray for them! He would have the church look to that.

Poor Sam, under view of the whip—often threatened, but seldom applied—on his knees, promised that he never again would have the audacity to pray for his white master.

Under this religious persecution he was tempted from without to leave his master a second time; but Sam still remembered how hungry and cold he had been, and he said, "Black Sam stay and pray for poor wicked Massa Gubbana: him best understanda, Sam's consituation. Bery good Massa when not in a huff—"

The governor, whatever his pious neighbors might think of it, piqued himself on being a most exemplary church Christian. Unlike Black Sam, he could repeat the creed without blundering one word. In his fort he had made a point of reading the service every Sunday morning—and, on Monday morning, of flogging as many of the negroes as did not attend chapel. Zealously had he defended the outworks of the church from the attacks of Methodists, as he had proved by his angry abdication. He would have sworn to the thirty-nine articles, and with a perfectly safe conscience, as often as any statute required or custom dictated. For why!—"every body, save Methodists and Presbyterians, did so." It is probable that the governor, who was, in every point, a man of action, did not enjoy the ministrations of a regular clergyman so well as his own service; for, until the era of Black Sam, he had not regularly attended church. Now he went—marching his marshalled household to church, every morning, Sam walking before, carrying his master's crimson and gold large prayer book; which was to the governor exactly what his breviary is to a good Catholic—a thing of mysterious sanctity; something resembling a bishop in full canonicals—a tangible and comely body of faith. The Bible held

but a secondary place in the governor's esteem. It was a good book, to be read on holyday evenings, by those who had time, but suspiciously revered by the Scotch, the Methodists, and Quakers.

Now, solemnly seated, at the head of his pew, the *Amen* certainly did not stick in his throat. His strenuous responses, and loud joining in the psalm, overpowered the choir and startled the congregation. He now partook of the communion regularly at Christmas, Easter, and other solemn tides; because such was the *duty* of a churchman, and because he read in the newspapers that the king and the royal family did so, with the Dukes of York and Clarence. A doubt of his fitness had never once clouded his mind. This was a mysterious rite, in which all good churchmen, rich and poor, were entitled to participate—and none else: and no "missionary puppies had a right to dispense the holy sacrament, nor negroes to partake of it. He had never permitted such a profanation in his government."

The religious opinions of Governor Fox might not have been the most enlightened, but they were the natural growth of his education, and of the system working around him. He was, like most other human beings, very much the creature of external influences; and he had been, for the greater part of his life, placed in circumstances which shut out light by nearly every approach. In England, light streamed in through many cranies. I have said that the governor, save on the question of slavery, the black niggers, and the church, latterly became a sort of tory-radical; and it may be regarded as a sign of the times, that, towards the close of his life, he had been so far corrupted by Cobbett's writings as to begin to question why a bishop should have so much higher *pay* than an admiral of the red; and a rector, than a colonel of marines! He never got further than this; though the direct operation of *tithe* upon himself would, I have no doubt, in one season, have made the governor a thorough church-reformer. He had already, by the unaided light of conscience, discovered that *no work no pay*, was the true principle to which society should adhere, with all its servants. At church-rate he grumbled excessively; and for this hardship his remedy was, that the Methodists, his general term for all dissenters, should be made to contribute double, to relieve churchmen of such burdens.

I am afraid that my old friend will scarce appear either a very amiable or even consistent character. He was, however, quite consistent with himself. Besides, I have hitherto been exhibiting his asperities and angular points, in that unhappy interval of ten years, when, having just lost absolute power, he had not yet learned to live on terms of equality and forbearance with his fellow-men; and when every passing day, from his own overbearing conduct, litigiousness, and credulity, was roughly dispelling his life-long dreams of the state of society in happy Old England. His faults were more those of ignorance and temper than of heart. As his understanding expanded, his judgment became more correct and his character improved. Though his prejudices were violent, they were few. He had no respect for names or persons, no partisan feelings, save in the nigger, and the church cases; and in him these were at least honest. Present any truth to him; and if he was able to perceive, he at once embraced it. General or abstract truth was not in his way.—His,

from original constitution and training, was a mind of facts and details; yet without any large views or well-defined principles, he often arrived at fair, practical conclusions. His moral pole-star was duty, though he had no very enlarged idea of the principle. His duty to his horse, to Black Sam, and his country, stood pretty much on the same level; though he might have a clearer idea of the former than of the latter kind of duty.

I have dwelt too long on these generalities. The first time I beheld Governor Fox, with knowledge—so, I mean, as to note and remember him as a man of some mark—was, as I have said, at the funeral of Lieutenant Walpole, leading "poor Ned's boy," as his phrase was. This was to see him to advantage. He was hotly and most characteristically alive to the indignity offered, as he thought, to the memory of "poor Ned," by the Walpole family sending an undertaker and their agent's brother, to see the last duties performed. Though he had quarrelled with all his kindred himself, he entertained that true old English respect for the *remains* of relations by blood, that, had the degree of consanguinity exacted the attention, he would at once have travelled a hundred miles to fulfil the duty of attending their funerals—putting himself, as the *Gazette* says, "into decent mourning." "Poor Ned" was only a brother officer—scarcely even that, for he had the misfortune to belong to the regulars—and the governor appeared at the funeral in his ordinary dress, with the customary knot of crape on his arm. He might at this time have been about sixty-two years of age; but he had not lost one hair's-breadth of his original stature of five feet ten inches, nor a single tooth. The strongest impression given by the first view of his person and physiognomy was that of decision. His firm structure, and compact fibre, the movement of his limbs, his erect, and somewhat stiff mien, the firmness of his walk, his compressed lips, and loud tone of voice, all bespoke promptitude, and hardy, confident decision—a man never given to question or doubt, much less to speculate. Yet no one could have dreamed that his was the decision of a high and vigorous intellect. It was the pushing, strenuous force, the sinewy and muscular determination, of a bold animal, or of a strong-willed man, whose maxim is, "Where there is a will, there is a way."

The eye was the most striking feature in the rained face of the old governor. In a cold day, when I have seen him buttoned and wrapped above the nose, and the eye alone visible, it was a luminary to be marked. That strong grayish-green, clear, frosty eye, quick but not penetrating, was of itself enough to show the man of prompt decision. It was certainly not in the least an eye like that of Mars, "to threaten or command;" yet it could sometimes twinkle and scintillate in a way which plainly demonstrated that the person who looked at you was not a character which it might be altogether prudent to trifle with. I have seen something very like it, though far more cunning, and as it were better instructed, under the shaggy brows of a Bow Street officer, near the head of the department. It would have been a perfectly appropriate feature in the countenance of a pilot, a smuggler, a whaler; then it might have been more ferocious or uneasy in expression; now, when it lightened, it was only an angry, not a ferocious eye—the eye of a man who could flourish a whip, but who abhorred a stiletto.

His natural love of order, a military education, and long residence in a burning climate, had made my old friend scrupulous and even finical about personal cleanliness, and in all his arrangements of the toilet. "*Cleanliness*," he said, "his mother had taught him, was next to *godliness*;" and the physical virtues was certainly much better understood by the governor than the spiritual grace. The one dwelt in forms and usages, the other was shown in the thorough, daily, and hourly purification of the spotlessly kept outward man. His *costume* denoted the *substance* and respectability of the wearer. It was an invariable ample blue coat, of the finest cloth, with red facings, and under garments of the same material, which in summer were exchanged for white linen or nankin. The black stock had its own set—the hat, like that of every man of individual character, its own fit. His boots, very thick in the soles, seemed a part of his original structure. I never saw him out of them but twice, and then he rolled like a sailor come on shore after being five years afloat, and scarcely looked his own man. The governor's taste was fixed before the date of embroidered military surtouts and Hessians, which he despised, together with most of the "*regular puppies*" who wore them. All his habits were as fixed as his dress. His favorite dish was roast pork, with bean-pudding; his general drink, rum and water. But though plain in his own taste, he was not stinted in hospitality, unless he saw his guests troublesome or gourmands. Such characters he despised even more than he did a *wigger* or a Yankee. His favorite game was backgammon, though he played a cool, steady game at whist—showing no indulgence to lax players; insisting upon every advantage to which he was fairly entitled, and no more; and sticking punctiliously to the *game*, the whole *game*, and nothing but the *game*. His poet was Dibdin, but on holidays, Sternhold and Hopkins; his favorite author was De Foe, whose stories he could never fully persuade himself were fictions, though he knew this was generally said. He had at once found out "that fellow Gulliver," which I presented to him: "He was all bam!" The governor had "sailed the world round, and seen no such little people; and, what was more, there was *nothing* of them in Mr. Guthrie's Grammar of Geography"—his staple scientific work. If any one would have taken the trouble, as I sometimes did, to tell him of the adventures of Cook and La Perouse, while he smoked his pipe, he would have listened with great interest and delight, and have made very pertinent remarks; but he relished oral much better than written narrative. "The puppies," he said, "put their stuff together, o' purpose, in such a way, that no plain man could spell 'em out." And yet he had made young Walpole transform his own log-book in this fashion.

The governor's favorite print was *Cobbett's Register*, a taste common, I have noticed, among old military men. Cobbett once offended him, by refusing to print his communications; and he dropt the *Register* for two weeks, but on the third gave in. One number served him exactly a week.

Though always rather averse to the society of females, whom he divided into the two grand classes of *white ladies*, and *black wenches*—the wives of the marines, when abroad, belonging to the former class—the governor was compelled to associate with women sometimes, or give up Chatham parties altogether. On trial, he confessed,

he rather liked some of the "baggages," particularly those who had "seen service;" and after he had fixed his household, he conceived himself bound in honor to receive the ladies on the occasion of his grand annual dinner; at which periodical festival every point of graciousness and gallantry was shown forth, in the exercise of his duty as a hospitable landlord. All his curious shells and stuffed birds were turned out. The highest-priced tea, the most costly sweetmeats, and the richest cake London could afford, were brought down by himself, to entertain his fair guests, who, he presumed, were all addicted to such dainties. I have seen his temporal arteries start, and his eyes redden, with the force with which, for their entertainment, he poured forth,

Thursday, in the morning, the nineteenth day of May,

Forever be recorded the glorious sixty-two,
Brave Russell did espy before the dawn of day, &c.

At such high tides, Black Sam, officiating in his gala costume, of white-muslin trousers and turban, with beads, a scarlet waistcoat, and sky-blue jacket, grinned, with an open-mouthed hospitality, upon the fair guests, and in admiration of his master's wit and humor, that to me gave no small additional relish to the entertainment. Rolling with suppressed laughter at his master's jokes and annual song, he would burst forth with "Berry funny, Massa—Massa Gubba-sa!" and then, as if afraid of having gone beyond the point of respect before strangers, he would throw down his distended eyelids, "Bery grand, Massa, too." Poor fellow, how happy was he then! "Was my occasional sickly feeling of pity for his childish mirth, not, after all, misplaced? No one feels compassion in witnessing the exuberant glee and bounding joy of children, and of young frolicsome animals of every kind. Why regret that Nature's sable family, with the simplest elements of pleasure around them, and its unbroken spring in their hearts, should forget how humiliated they are, and how wretched, reason says, they ought to feel.

The governor held no maxims of conduct upon which he did not act; and this made me rather wonder why, with his utilitarian notions, he disguised Sam in this fantastic costume at his galas. But besides some particles of latent vanity, or fondness of barbaric pomp, brought from his government and his days of African splendor, he alleged that monkeys, popinjays, and niggers, were meant by Nature to wear yellow, green, and scarlet; and the latter to dance, sing, chatter, and play the bassoon and negro-drum, and cultivate sugar canes for white Christians.

A supplementary, or fragmentary feast, always followed the governor's annual banquet, which was, in various ways, more interesting than the grander display. It was a true Old English exhibition of beef, beer, and bread, to his various clients in the neighborhood,—disabled marines, and their dames. Though his house was not often open either to the needy or to the suffering, "who had seen better days," there was a class of persons to whom Governor Fox was nobly liberal—old, infirm paupers, and maimed or blind persons, evidently disqualified to earn their own bread, especially if they had been in service, wounded, and without pensions. They had only to come to him with clean skins, at a reasonable hour, and

say they belonged to the church, to be sure of aid any day, so far as a substantial meal and a few coppers. His locality often swarmed with miserable women, followers of the troops, or soldiers' wives, with a fry of half-starved, puny children, to whom his casual bounty was uniformly extended; though, on such occasions, he never failed, for the benefit of society, to deliver the whole sum and substance of the doctrines of Malthus, in a few sweeping and pithy sentences, generally put in the interrogative form, and pronounced with angry emphasis and energy; no matter how public the preaching-place, or who were the auditors. Walking, riding, or driving, the governor, before distributing his bounty, at the rate of about a penny a-head on the attendant military brood, never failed to halt and rebuke the mother in a few pithy words of Malthusian doctrine. The governor was, however, in this, quite innocent of plagiarism—even the name of the great modern philosopher had never reached his ears, till some years afterwards, when he became a Reformer, and began to study every old soldier's favorite print, *Cobbett's Register*.

This was not until his fortunes had undergone a mortifying change. The fate of the South American speculation may be surmised. He lost every shilling of his "investment." The Scottish Ale Company turned out even worse; but the Drury-Lane shares was the worst concern of all. We were now at the most ticklish time of the war—near its tremendous close. The funds were tumbling down every day; and in one of the few anxious days that preceded the battle of Waterloo, I saw the governor arrive very early from Rochester, on foot! in a plight that I shall not easily forget. He came directly to my lodging. He had been on the road from midnight.

"On foot!"

"Ay, and why not?—Is it for beggars to ride a-horseback, sir? Don't you see how those d—d stocks are tumbling down. Let Master Pitt look up now, I bid him, to his act of 1797—his paper rags. Not but that I could weather it for myself, if the trifle Widow Walpole intrusted to my management, were once secured in hard gold. Thank God, I can handle a pickaxe, a spade, or a skull on the Thames yet;—but a widow, and a gentlewoman, cheated, or bubbled in trusting to Stephen Fox!—all she had scraped up for seven years, to give Ned his schooling, without being beholden to these Northamptonshire dons, her husband's relations, who have neither conscience nor bowels.—It is enough to drive a man mad."

"You have not invested Mrs. Walpole's slender funds, I trust?"

"No!" roared the governor, "save in those blasted English Funds:—down one fourth, Friday, down one sixteenth, Saturday, down one eighth, yesterday. The vitals are eaten out of Old England by subsidies, loan-contractors, and Jew-jobbers. I have walked up to London, sir, with this hazel-stick in my hand, and a couple of clean shirts, and my prayer-book, in this bundle, to begin the world again. Can your landlady let me have any dog-hole of a garret at 2s. 6d. a-week, or 'so? I can't promise more at first. I have written to Bamboo to take the lease of my box, which he always longed for, and Sam off my hands. An idle man has better chance of a job about London, where there are so many coal-lighters, and so forth, than down yonder."

"Governor Fox, you amaze me!"

"Amazed, to see an old man, a fool, and a beggar! ha! ha! ha!—from having been a credulous idiot!"

There was something terrific in his laugh; but Governor Fox was too firm-spirited long to give way to this wild mood.

"Have I any claim to Chelsea, or Greenwich, think ye?—My pipe is what I shall miss the most—no luxuries now. I hope the Lord will call me home, however, before old age and frailty drive Stephen Fox on his parish, with all his cousins grinning at the governor. In the mean time, can your landlady let me have a garret? I must have my billet settled for the night, before I look about me. I can make my own bed, buy and cook my own victuals, wash my own shirt, and keep my place clean myself. You can answer to her, I suppose, that I am a man of sober, regular habits, who attend church, and pay my way as I go.—I can surely make my bread, were it but selling mackerel—what the deuce should I let down my heart for?"

Ludicrous as this was, I could not, durst not laugh.

"My dear governor, though you have had losses and crosses in these evil times, you are certainly exaggerating the tricks of fortune. Depressed as the funds are, you must have, even though selling out to-day, which none but a madman would do, a very comfortable reversion."

"Not a doit!—not a stiver, I believe, will be left; but no matter, I will have, what with the lease, the furniture, my three swords, and gold epaulettes, enough to clear with poor Mrs. Walpole. There's a woman of honor and resolution, sir! saving from her widow's pension; while I have been squandering like an extravagant puppy. It was her duty to be frugal, and she has been so; but how few of the baggages, if at her age, could have been equally resolute:—they must have this gown; and it would not be *decent* to go without that cap—not that they ever care about it—for themselves—not at all!—Then who the devil does? let them answer that."

I let the governor divert himself by rambling in this new course, and indulged my private fancies as to the origin of the unusual warmth of his rooted esteem for the widow, who, last night, when he had apprized her of her danger, had behaved, he said, "like a hero, and an angel."

"The general run of womankind would say, 'Oh! the rich relations will surely some time seek after, and educate the boy. I must have this new bonnet, and t'other gim-crack.' Mrs. Walpole has trusted to no such contingency. *Contingency!* do you mark, sir. And what, pray, makes the difference between a man or a woman of sense, and born-idiots, but this same trusting to contingencies:—that the one holds the whip-hand of fortune, as she has done, and that the other lets the jade drive him, like me.—But having secured my billet for the night, I must be off to my broker. I have written to him by every post:—always *down, down, down*. Last night he rather advises selling. If I have one five guineas, ay, or five shillings, of reversion, after paying my just and lawful debts, by Jove, I'll hoard! I'll lock 'em in my old sea-chest, which I bought when a boy at Halifax, for a dollar and a half. It can now hold all my worldly goods—I must send it up cheap by the wagon.—But I must be off: the broker, that puppy Pantague, urges selling out to-day. Next mail will bring us down, perhaps, a whole per cent—

perhaps ten, or blow us out of the water altogether—who can tell? who can tell? If I had taken Cobbett's advice and warnings now, and laid up a few guineas!—Where is there a cockney scribbler among them, with their *Times* and their *Chronicles*, ever showed how fast this country is going to the devil, so satisfactorily and clearly as the old sergeant!"

"Cold comfort that, governor; but I do insist and entreat, that, before giving Mr. Pantague your final orders, you wait the next mail. London is on the tiptoe of expectation—good news must come—worse than our fears have painted cannot arrive. We shall have a rise this morning!"

My persuasions had no effect, which I regretted, as I believed he had received bad, I was unwilling to think sinister, advice from his broker. It was a crisis of fearful excitement, panic, and delusion. Every hour might relieve us from suspense; but then it might be to deepen our loss or sufferings; and I was a fundholder, too. I assured the governor, in the mean time, that not Nurse Wilks' garret, but the best chamber in her house, and that was my own, was much at his service; but, in the mean while, I hoped he could return home in a chaise to-day yet, and sleep on his own bed.

I accompanied the governor to his destination, though he assured me there was no danger of leaving him alone.

"Your turtle-feeding alderman may go after their lost plums, to feed the great fishes. I will neither drown like a blind puppy, nor hang myself like a nigger in the sulks. I can work, sir."

There was already an unusual buzz in the streets. I held the governor fast by the arm, to detain him a few more minutes from his broker.

"If I were a rich man, governor, or one whose credit was good, I would, at this moment, underwrite your whole present funded property, as you originally placed it, for five shillings."

"More than it's worth, egad! but let me go, man—don't you see Pantague signaling me from his window; there's the carriage coming to convey him to 'Change. *They'll ride it out, by Jove!* over our necks, whatever becomes of old men, widows, and orphans."

I held him the faster; men, boys, women, were now all hurrying to and fro, or collecting in groups, with eager speech and animated looks, on every side; carriages and horsemen hurried along, some east, some west. News certainly had arrived; express came hot after express; but no bulletin had yet been sent from Downing street to the City. A dreadful defeat, it was whispered about, had been sustained by the Allies—the ruin was total—of Europe, and of Governor Fox. The morning papers were all doubt and mystery.

"Let me off, man—if I don't sell out to-day, I may hang myself at night, for I never can face Rochester. *They'll be at twenty-five to-morrow.* We shall have French assignats for old English guineas, by Jupiter!"

We had something like a struggle when he offered to break off. "Remember—I protest:—I warn you, for Mrs. Walpole's, for Edward's sake: you are going to throw away her little means, which to-day it is in your power so much to improve—to ruin absolutely, or deeply injure yourself: you are the dupe of jobbers—you will curse yourself to-morrow and forever, if you sell to-day. Did I not plead with you *against* the Scottish Ale Company—the Drury-Lane Shares—the South

American speculation.—Hark!" It was the roll of a distant gun:—another, and another. The governor was a little deaf even then, on one side of the head; but when the rejoicing boom rolled majestically up the river from the Tower guns, there was no longer doubt. The exulting shouts of the gathering multitude—the outburst of all the bells in London, told the same tale:—a splendid, a decisive victory! The newsmen blew their horns. "Three per cent. better already! Hey, governor!" was my rising cry to the now stunned capitalist—stunned but for five seconds. We went along and heard the first confused tidings of the Field of Waterloo. Eighteen or eight-and-twenty thousand human beings had there bitten the dust—what an image is that homely one of mortal agony!—and London was in a frenzy of joy, and the funds up, I cannot tell how much, in one hour. What histories were that day in men's faces!

The governor bore the sudden tide of fortune with entire equanimity. He had been quite ready to take a spade or an oar, and was now equally ready to hire a chaise to go home, to be wiser in future. He thanked me for my counsel, and owned that for once he had done well not to act upon his own judgment—"For why!—he had some knowledge of war, especially with niggers and maroons, and had studied gunnery and fortification; but how could any honest man out of London, though a good marine officer, be up to half the tricks of those stock-jobbing fellows, who ought to have their ears cropped, and be transported, every mother's son of them, as knaves and cozeners!

"Now, mark me, Mr. Richard Taylor; let me only get back my own of them—I scorn a sixpence of their dirty Jew money—and if a guinea is to be bought for twenty-five shillings in England, and a strong-box to lodge it in, by Jove, you shall see if Stephen Fox is to be humbugged a second time by that great humbug, which will burst and go off some morning like the shell of an over-charged bomb. I have a plan in my head—but never mind—I shall tell you as we go down to Rochester. The only obstacle is Ned—and the young puppy loves me, and has been bred about my own hand—a tractable, sharp rascal, and all as one as my own already."

The reader will please to remember that it was with this same "Ned" I sat talking over all these old matters, now suggested by reading the death of the old governor in the newspaper. In spite of his sincere regret, when we got the length of the governor's sudden brightening of fortune priming him for matrimony, Mr. Walpole burst into a loud and violent fit of laughter, as the whole scene of the governor's unpropitious wooing rose to his memory—of the governor, who always took time by the forelock, arriving at his mother's cottage in full regimentals, sword, and epaulettes, and heralded by Black Sam, on the evening of the same day he had walked to London to *sell out* and seek for honest labor—his bold, resolute look, as a bachelor of sixty, who had now first screwed his courage to the sticking place, and resolved he would not fail—and the embarrassment of poor Mrs. Walpole, who was innocent of all design of charming her kind old acquaintance, the friendly governor, within many degrees of matrimony, and who was now considerably alarmed by her conquest. Yet she had certainly assured him, on the previous evening, "that however low the funds fell, and precious as was her little hoard to her son, she

should ever rest fully satisfied that his intentions had been most kind and disinterested. What, after all, was their loss to that of the many anxious, and soon probably to be, the bereaved and sorrowing mothers and wives of England!" When Walpole thought of all this, he laughed outrageously.

How she contrived to reject, without mortally offending her admirer, I cannot tell—neither could Master Ned, Black Sam, nor Hannah the housemaid, who had taken their station in one listening group, without the parlor door, to overhear the governor's declaration in form. "A parson," the governor used to say, "could not have put it into prettier language."

"It was exceedingly impertinent in me, I own," said Walpole; "for I was then a shrewd boy, and the negro and the girl little better than idiots; but somehow, though my own mother was concerned, the temptation was irresistible. The comical face of Sam alone—who was grinning from ear to ear, rubbing his hands, half-dancing through the kitchen, and singing extemporaneously, in negro fashion,

Pretty Missy Walpole,
Marry ould Massa Gubanna,
Him be a crusty ould fellow,
And Massa Neddy's pappa,

—was it not enough to plead for me, a fun-loving lad of fourteen? Poor old fellow! but among all these odd legacies of his—very odd for him, certainly—£200 to the Ladies Tract Society; £500 for the Wesleyan Missions;—(how the saints have got about him at last!)—£150 to the Society for Preventing Cruelty to Animals, &c., &c.—who, I wonder, is to be the happy legateé of Sam Dixon, a black man of the Sow-Sow nation? If Charlotte would not be dreadfully shocked by his hideous ugliness, which soon wears off, I would be so happy to receive poor Sam under my own roof; and you know how handy and trustworthy a fellow he is—how much worth his board and wages to any family;—suppose the idea were to come from you?"

I liked the notion of conspiring against my niece with her future husband, in her own house—which she had as yet only seen about half-a-dozen times, under my escort, and strictly *incognita*—and took it up at once.

"If Sam does not whine to death, like a faithful spaniel, on his master's grave, I give you joy of so excellent a domestic; though hardly yet can I believe this printed *will* authentic,—£1500 for the conversion of the Jews!—Perfectly preposterous! or else our old friend has gone delirious on his death-bed."

The rapid drawing up of a carriage—a thundering peal at the house-door, and the loud, hale, clear tones of the old governor burst on our admiring ears! We were down stairs in a moment. Walpole could not have given his bride a warmer—he might a gentler—welcome. He absolutely hugged the old governor, who hugged "Ned" in turn.

"So you saw the puppies had killed me off, and made my will, too,—and be crushed to their impudence! £150 to the Ladies' Tract Society!—Did ye note that!—Mr. Richard, my service to ye; here's a hand for ye, too. It's all an election rouse, man."

This was a frequent lingual slip of the governor's, among others;—he meant *ruse*; and the

substantial meaning is so much the same, that the mistake is scarcely worth noticing.

"An electioneering *rouse*, sir, put out by some of the editor puppies on the Bamboo interest."

"My dear governor—you a candidate for parliament—seriously!—And opposed to Colonel Bamboo?"

"Why, ay. Is it so wonderful now, that a man, a bachelor, without chick or child, should throw away a few thousands to be something of a patriot! Don't you see, Wellington is driving the nation to the dogs, four-in-hand! They'll let up the Papists in Ireland to cut all Protestant throats; they'll let loose the niggers; they won't take off the malt-tax; they won't give us gold for the paper-rags;—they make the loaf double price, as I'm told, to the poor man. I'll have down the loaf; all the commons restored, and the bypaths opened; poor men shall brew their own beer, and make their own soap, without taxes and gaugers. The fat parsons get too much, I begin to think. Oh! you shall see how I will lay about me, and pull up pensioners and all, once I get into the House; and I'm told it won't cost much above £3000 altogether. Those newspaper coxcombs at Rochester, who never have room to take up my ideas when I write them, will be glad to print my speeches."

Walpole and myself were struck dumb at first. A sharking attorney, the agent of a more sharking Jew boroughmonger, who looked round and sold to the highest bidder, had been practising on our single-minded unsuspecting friend, who was supposed much richer than he really was. He made no secret of the affair. He was to be supported against Bamboo, who wished to come in on what he called the liberal interest; though so far as his medley of political notions could be comprehended, the governor was out of sight the more liberal of the two. We knew the nature of our pig too well to try at once to unship him, by pulling him backwards.

"The gallant member for Chewsburgh on his legs," cried Walpole. "*Hear! hear!*"

The governor chuckled involuntarily.

"The colonial office fellows will deign me a reply to my memorials, then, perhaps," he said.

"Rather inaudible in the gallery—*Loud laughter*—cries of *Question! Question!* through all parts of the house," continued Walpole.

"The parliament puppies can be cursed impertinent, I know; but that don't frighten me; let me alone to manage 'em. I won't be brow-beat. Have I not drilled marines, and harangued the native chiefs before now? It must be your business, Mr. Richard, to get me fairly reported. Those reporter whelps, I'm told, play the deuce with a new member where they take a spite."

"I have no doubt, governor, but that you will be a prodigious favorite with all the reporters. An honest man with a new face has a great chance with them—were it only for the novelty. How I shall long to read your maiden speech!"

The governor laughed again with irrepressible glee.

The Jews were to have his money any way. If not for their conversion, then for his own victimizing.

"The newspapers," continued he, "with their usual impudence, will, no doubt, be saying, Ned there makes my speeches for me. I'll have them know that Stephen Fox, as an independent member of parliament, will take his lesson of no man."

"Jealous of me, governor?" said Walpole.

"No, Ned;—but you must not come near me for three months or so after I'm in. The fellows about Brookes', and the United Service puppies, will swear Ned Walpole has primed the old governor. So I'll make no fine Latin speeches, d'ye mark!—but just take my post somewhere against a pillar, like Joseph Hume, and give it 'em *hot and hot* every night of the week; and, egad, if I don't pepper 'em! Now, Ned, if you need a frank or so for your *mother*, you know where that worthy lady has a friend."

Mr. Walpole and I exchanged looks. How was this moonstruck madness to be stayed!

All the address of Mr. Walpole and myself could not break off the negotiation proceeding under such "favorable auspices," between the agent of the Jew boroughmonger and our friend Governor Fox. He would be in parliament. He had set his heart upon it. He would reform many abuses, and remove numerous grievances; make a great figure, do a prodigious quantity of good to the poor, the church and the marine service; and, above all, defeat Colonel Bamboo, whose cool effrontery, as he conceived it, in opposing him, after eating his curries and drinking his Madeira for so many years, provoked him to the highest degree. It was a breach of every law of hospitality and good-fellowship—almost a personal affront. An electioneering attorney could not have desired a more hopeful subject. The governor was wound up to the pitch of carrying on the war with spirit, and spending half his fortune in the contest; and I don't know how it is, but this fever of election excitement is wonderfully catching. We who had begun by strenuous opposition, first covert, and then avowed—seeing better might not be—at last lent ourselves heartily to the "Fox interest." Even in their honeymoon—the last week of it, however—Walpole was penning electioneering squibs, and Charlotte making up Fox favors of navy blue and red; while I worked hard in the governor's committee, principally, I confess, as a check upon the lavish expenditure incurred in every quarter. I was resolved that, in the first place, he should pay as cheaply as possible for his whistle, and next, that he should have skill to play it, so far as that art might be speedily imparted by his friends. With the requisite physical energy, lungs and wind, he was largely endowed.

Though, as a rational reformer, I am bound to hope that, in the enlightened progress of society, canvassing, and, much more, *braving* an English elector, will soon be accounted as profligate and scandalous as it would at present be to canvass or bribe a British judge, I must confess, that there is something wonderfully exhilarating to "corrupt human nature" in the bustle of a canvass, when anything like the show of freedom of choice remained among the great body of the voters. Now, our borough, though as corrupt as any one subsequently placed in the purgatory of schedule B., was not quite sunk into the torpor of those which afterwards found a place in schedule A. With Chewsburgh it was universal gangrene, but not yet absolute putrefaction of the whole parts.

We carried through our man with *great eclat*, though protests were taken by the other candidate against so many of our votes, that, if one third of the exceptions held good, it was clear the governor must be unseated. Of this consequence he had no adequate notion. He was told he was the sitting member for Chewsburgh! He was in

extravagant spirits, and the hurry and bustle of the affair left him no leisure to think of the bill of costs:—

“Then comes the reckoning when the feast is o’er.”

But we were still at the banquet.

After our candidate had foundered in several set speeches penned for him by the attorney and by Walpole, when fairly driven to his own natural eloquence, quickened by passion, his addresses made such an impression upon the John Bulls of all complexions, collected in front of his rostrum, (the balcony, over the porch of the inn,) that had the market people been voters, we would certainly have carried the governor by acclamation, in the teeth of the professedly liberal candidate. The hearty cheering of the crowd produced a wonderful effect on the spirits of the orator. I have never yet seen a man more elated for the moment by that intoxicating incense, that true laughing gas,—

“The fickle reek of popular breath.”

It is true, strong and sound as his brains were, he was late in life of first inhaling it.

“And if I speak here in open day to the satisfaction of 500 honest chaw-bacons and smock-frocks, and 150 men in broadcloth, why mayn’t I to the 100 honest independent members in St. Stephen’s Chapel, with the 300 humbugs, and the rest of the jackanapes, the surtout and mustachio sprigs of quality fellows to boot of ’em! Let me alone. I have hit the nail on the head at last.”

“I was always certain Governor Fox would make a most useful and distinguished member of the house of commons,” said the attorney. “And unless he had possessed extraordinary mental and moral qualifications, I never —”

My most frequent and peaceful mode of rebuke is to interrupt the speaker:—“I have not the least doubt,” I observed, “but that the governor will be sufficiently distinguished, were it but for that rare quality of straight-forward, blunt sincerity.”

There was but one drawback to the *eclat* of our election: though Bamboo was hissed to our hearts’ content, the few favorable symptoms of a riot, which broke out at the close of the poll, soon died away, and the tremendous crash which made the eyes of our new-made legislator twinkle and brighten, as he hastened to the window, proved, on investigation, to be nothing more than a lawful, though rough hammering down of the polling-booth. The smashing of the windows of Bamboo’s inn, on the opposite side of the market-place—the committee-room of the *Yellows*—would, I believe, have done the governor more good than his own apotheosis of chairing, which, however, he enjoyed immensely. Though not fond of expense, I am sure he would have willingly paid the broken glass, and plastered the broken heads out of his own pocket, to have had his true old English revenge on his rival complete. He affected none of the hand-shaking, complimentary magnanimity of these silken times. He owned, or rather he proclaimed, that he hated Bamboo like the devil, and wished him to lose above all things. Though bound by the duties and decorums of an infant law-maker, I fancied a tone of reproach in his remark to Mr. Walpole, when all was over, “that Englishmen had lost half their spirit at elections.”

And now all was undeniably over, and the new member had written franks for everybody around him. Beginning, as a mark of high distinction, with Mrs. Walpole, dowager, he left not off till mine host of the Red Dragon, and even *Boots* himself, was supplied with one frank for his mother, and another, I dare say, for his sweetheart. The governor’s bounty in franking was boundless.

The bill of the Red Dragon was still to pay, and the new member had never left any house of public reception with his bill unsettled, in his life. Red Dragon preferred settling with the agent, according to the ancient and approved custom of all elections in Chewsburgh—whether contested or not. It was, indeed, with some reason that the landlord persisted in refusing to tender his bill, pleading want of time, where there were so many *trifling* items to enter; as I have little doubt that our new law-maker, on its presentation, would have furnished him with a few more—such as “To one broken head,” or “To a kicking down my own stairs,” had it been tendered on the spot. I cannot tell to how much the Jew agent’s percentage on the whole amount might come: but I recollect that one item of the bill, of many folio sheets in length, was £764, 11s. 3d. for chaise-hire for bringing in the out-voters. Brandy and water furnished to the committee-room alone, independently of soups, sandwiches, lunches, wine, wax-tapers, &c., &c., &c., came to above £240 during our one week’s labor. At that awful reckoning, the settling of which took place some months afterwards, I still recollect the sneaking look and whining tone of the country attorney, while he addressed the rampant governor in these words,—“But the *duty*, my dear sir—you don’t consider the heavy duty on brandies, governor, with the expense of the victuallers’ license, sir, and the house-tax, and window-tax, which, on the Red Dragon, amount to a heavier annual sum than the corresponding taxes on the noblest mansions in the county—to double of that, indeed.”

“You are telling me a cursed lie,” cried the furious governor, “when you tell me that that paltry inn—but it’s a good enough inn—but that that paltry fellow pays half, or fiftieth as much house-tax as is paid for B—Castle.”

The man appealed to me; and I believed this part of his statement, at least, extremely probable, though I was prepared to deny that these premises warranted the sweeping conclusions of Red Dragon’s bill. When the attorney had been summarily dismissed, with a peremptory assurance that, until the bill was cut down two thirds, not a sixpence would be forthcoming, the governor reverted to the subject.

“£240 for brandy and water, and refreshments!—how much is the water a quart in the Red Dragon? Heard you ever, Mr. Richard, of such an extortioning rascal! Why, every man of the six of ye might have been kept royally drunk, from morn to night, for a month, upon £40 worth of real Nantes. ‘But the *duty*, my dear sir,’” he continued, with an air of mimic-king the attorney. “And what the deuce is the *duty*!”

“What would reduce the brandy charged in your bill to at least one fourth of its price—the *duty* is, at present, about 22s. 6d. a gallon.

“The deuce it is! I knew it was damnable upon Schiedam, or old Jamaica rum either. The doctors ordered brandy for old Stokes of the artil-

lery, and Geneva toddy for Lieutenant Denovan of the Invalids; but they, poor fellows, can't afford it—that 's hard now. Though old Jamaica rum be, out of sight, a sounder, better liquor than either, the brandy and Schiedam were to them in the nature of medicine. I understand I am paying more than treble price here for Leeward Island rum which I did abroad for Jamaica—the primest. That is harder still; and the Yankees getting it as cheap as ditch-water. Why the devil, can you tell me, have we Englishmen not our own rums, and sugars, and teas, as cheap as the Dutch and the Yankees?"

"It will be your duty, as a member of parliament, to inquire into that."

"And that it will; and, what is more, I'll do it. I know, though, it is quite right not to let good British gold go to our natural enemies, the dancing, capering Monsheers, or to the greedy Dutchmen, with their big breeches:—I suppose it is for that they tax Geneva and brandy so cruelly; but old Jamaica rum, made in our own colonies, by our own niggers, for the benefit of our own planters—"

"That makes a difference to be sure; but not so much, either, to men like poor dyspeptic Stokes or Denovan—liking better pure brandy and Schiedam-punch, or requiring them for cure or comfort, and too poor to purchase solace or healing, in consequence of the high rate of our taxation."

"But you see it is to keep our gold out of the pockets of the French and the Dutch, who fit out fleets and armies against us, and fight us with our own cash."

"Or pour it into the pockets of those not much nearer and dearer to us than the Gauls and Batavians. Is it not folly, think you, governor, for a man to punish himself in the first place that he may annoy his neighbor in the second, admitting that such annoyance were justifiable at all, or that we had power to inflict it? The man must have a large stomach for revenge who does so. Would you not think him a fool?"

"One must do a great deal for the good of one's native country, Mr. Richard."

"Granted. If the real good of Old England requires that, though preferring or requiring foreign spirits, we should, nevertheless, poison ourselves with villainous English gin, I am too good a patriot to object. If for the national good, set the ten thousand casks afloat,—let them—"

"Forever dribble out their base contents, Touched by the Midas finger of the state, Bleed gold for ministers to sport away. Drink and be *poisoned*; 't is your country bids. Gloriously drunk, obey the important call: Her cause demands the assistance of your throats,—Ye all can swallow, and she asks no more."

The governor had scarcely patience to hear me out. "This is some of the piperly stuff of your snivelling poets, or Temperance Society fellows."

"No such thing—at any rate the words are used by me only as a plea for better tipple. I avow I see no means of putting an end to gin-drinking, half so effectual, as allowing people to have *cheaply*, good rum, Hollands, and brandy, with food, shelter, and clothing. These are my engines for putting an end to intemperance.—But this abominable bill!" I took up that of the Red Dragon, which, if laid on end, would have extended over all its mazy passages.

"What withheld me yet, Mr. Richard, from

kicking that rascally attorney down stairs, when he dared say to my face, that his Grace the Duke of —, pays less house-tax for B—— Castle, than that cheating fellow, his employer, lately the butler of a small squire, for his paltry inn?"

"First, my dear governor, because kicking—save duns—is not a parliamentary privilege; and lastly, because, I dare say, you suspect that the statement may be quite true."

"What, sir! the Duke of — pay no more house-tax than a paltry-tavern-keeper, in a country town! It would be a manifest affront put upon the old nobility of England to let them pay no more."

"Ay, governor; yet that noble duke, and also he of Leeds, and Newcastle, and Devonshire, and Marlborough, and Northumberland, and Grafton, and Buckingham, and the whole ducal bead-roll, pay at the same rate. It is marvellous with what good grace their Graces submit very gracefully to the affront of paying a very small share, or *none*, of the national reckoning."

"Now, arn't you joking with me, Mr. Richard?"

"Never was more serious in my life. This is a fact so notorious, that even a new member of parliament might know it. How much house-duty do you pay at Rochester?"

"Why, about £12. I appealed, to be sure, but the rascals showed me an act of parliament for it; and I appealed, also, against £2, 19s. or something that way, which they charged Mrs. Walpole for her small cottage,—the lubberly fellows! plundering widow women, living barely on their small pensions; but that was for her windows, too,—and indeed the rickety brick and plaster tenement, which, I could have pushed over with a good drive of my shoulder, was not worth more than that sum of rent."

I inquired what several other of his friends and neighbors paid, and was satisfactorily answered. They were all charged the full amount exigible on their rent,—and that rent highly, if not exorbitantly rated. My brother's house-tax, for a house in London, rated at £300 a-year, was above forty guineas.

"Well, my brother pays this. His house is, to be sure, dear-rented from its locality;—now what pays Euston Hall, one seat of the Duke of Grafton?"

"What! the show-place—the place we see in the pictures?"

"The same."

"Why, a good round number of hundreds, I'll be sworn."

"What pays Blenheim, the Marlborough family's place—you have seen Blenheim!—or what Nottingham Castle, the pride of the Newcastle?"

"A swingeing sum, I guess—if Mr. James Taylor pays above forty guineas for his house in town, and myself £12 for my box at Rochester."

"Why, £14 for Euston Hall, and ditto for the Duke of Newcastle's stronghold."

"By the Lord Harry, you don't say it! Well, there is work ready cut out for me.—If I don't affront them, from Laud's End to Berwick-upon-Tweed, and make 'em tattle their coins, call me a crop-ear. Why the deuce don't the dukes and lords pay fair down, like other honest householders?"

"Affront them? poh, poh. That is not so easily done."

"You may say that, any way, of those who have their lady mothers and dowager grandmothers

passioners; though their husbands, perhaps, never saw more service than a review day at Hounslow,—or in camp on the Sussex coast played at soldiers. Why, they are meaner beggars than a hobnail's gammer in the work-house, for she would not be there if her son had wherewithal to keep her out."

"With this additional circumstance of aggravation, that the honest chaw-bacon is so cruelly taxed in his basket and his store, for the benefit of the grandee parties, that he is rendered totally unable to support his own mother."

"Now you are at that bread-tax again. It is all puzzle-work that to me, though I see no business an industrious free-born Englishman has to pay more for his loaf than a Frenchman or a Hollander."

"Or to be tied up from buying where he can find bread, or what is the same thing, bread-corn, best and cheapest?"

"By Jove, not—certainly not! Why should he?"

"Why, because landlords must be able to clear their mortgage interest, and maintain their splendor; and don't know else how to set about it."

"Why the deuce do people let 'em!—They shan't pay out of my pocket, though."

"Nor out of the pockets of your constituents, if you can help it?"

"My constituents! You know that is all humbug; but why should bread and meat be dearer than it was when I was a boy? That's the question. One of the first things I remember was my father speaking about the Hanoverian rats, and Walpole, who brought in the excise and the tax on beer; I'll have off all that;—but what, now, in my place, Mr. Richard, would be the first thing you would broach in the house? A bill to burn all these spinning-jennies, which spin the Peels and Arkwrights into fine estates, while Englishmen are working for them upon potatoes and water-gruel!—The threshing-machines, too, which take the work out of the poor laborers' teeth, and send them to the work-house?"

I shook my head.

"I'll be hanged now, sir, if I know what you would be at. Well, if we may n't burn 'em, what say you to taking the owners bound, that no Englishman shall be thrown out of bread on this account. When you knock up any office, you always pension off the fellow that held it, and call that only justice, since you take away his employment; and what is more, I will hear nothing of the machines, unless they come bound to afford the men working them, fire, food, and clothing, as Englishmen should. You are shaking your wise pate again;—do I ask what is unreasonable?"

"Only impracticable, I fear."

"My next bill shall be to make everybody go to church, which you must own will be a vast saving in point of economy, besides promoting piety and good discipline—no straggling after Methodists, and Ranters, and Anabaptist fellows,—no good in paying twice over; first to the parson, which they must do any way, and then to the chapel, for their whims. There will be a good swingeing saving at once."

"There are two ways of accomplishing this:—pay him only whose services you require."

"What, sir?"

"I say that I agree with you:—once paying the parson is quite enough; but let it be him you pay, by whom you wish to be served. There are

two ways, you see, of accomplishing your excellent, economical object. If every man pay only for the religious ministry he approves, there will be no double-payment, and consequently no hardship."

"You are at that puzzle-work again. Don't you see, man, that the landlords and farmers are bound to pay the parsons to preach in church to the poor people; so why need they tax and starve themselves to keep up Methodist chapels?"

With all this, and though the governor's repugnance to the "snivelling, canting Methodist fellows" never was fully conquered, he was more easily brought to see that tithes, and every kind of church revenues, were national property, than if born heir to the adwoson of a good benefice or two. Still he was sadly perplexed—for as yet he had little more knowledge of any public principle, or political question, than ninety of the hundred of the young, or even the middle-aged gentlemen, at that time chosen members of the honorable house.

Though I failed in most other points, probably from attempting too much at once, I succeeded completely in demonstrating to my pupil the propriety and necessity of a free trade in the first necessaries of life. It was a proof of the integrity of his mind, and the singleness of his heart, that he believed the landed proprietors of Great Britain only required to have the same facts clearly set before them, to cease from grinding their fellow-subjects by a monopoly for which posterity must think with contempt of the men of the nineteenth century, who endured it so long, after fully perceiving its iniquity. The governor came to know them better; but unfortunately he never found an opportunity of entering the lists for the laborer, against, as he said, those who thrust their greedy fingers into his dish; and who, for every slice of his loaf that went to feed his children, subtracted a half one, or what was equal its value, for their own benefit. The governor had only spoken once in the house—though he voted staunchly *against* Catholic emancipation, and for the abolition of the duty on Baltic timber—when an election committee, after all fitting deliberation, the examination of a host of witnesses, and numerous reports, declared his election void! Bamboo was the sitting member,—and the bill of the Red Dragon was yet unsettled!

The poor governor! I give myself praise for the long-suffering with which I bore his transports of rage at first, and his sallies of temper long afterwards. A bilious attack ended in a violent fever, which acted as a counter-irritant in mitigation of the worst symptoms. To save the patient from a fatal relapse, Mr. Walpole, during his recovery, parried the attacks of Red Dragon, and, afterwards, by threatening Jew, agent and landlord with exposure, effected a considerable deduction from the bill of election expenses.

The final settlement left our old friend minus £5700, a considerable quantity of black bile, and all the fragments of his honest prejudices for merry Old England. This affair brought the infirmities of old age with rapid strides upon the governor. At the commencement of the canvass, though verging on fourscore, Governor Fox looked more like a hale man of sixty-five; but a painful change was now perceptible. He never fully recovered his flesh, or former toughness. Toughness, rather than mere strength, had been alike his physical and spiritual quality; and though,

respectability or not, it may very probably be brought about. Half Chatham believes it a settled thing."

"And laughs accordingly.—No, no, mother. I can't give my consent. Let him make Miss Kate his heir, if he chooses, to what reasonable or unreasonable extent seems to him good; but he shan't marry her, I promise you, if I can help it."

The governor dined with us on that day, as he always did when Mr. Walpole visited his mother.

In the morning we had met him, the walking military escort of the pony phaeton in which Miss Chadleigh slowly drove the fat, arm-chair Lady Louisa. The exceeding graciousness of the younger lady to Walpole, who had never been a favorite, was a suspicious circumstance. She even manoeuvred that we should both be invited to the card party at the lodge on the same evening, which we however declined.

I have said the governor dined with us. Immediately after Mrs. Walpole left the dining-room, we began our concerted plan of operation. It is told, that a maiden lady of fourscore, on being asked at what age a woman ceases to think of marriage, candidly told the interrogator, he must apply to an older woman than herself. The age at which an old man's vanity, in affairs regarding the sex, becomes extinct, is equally dubious. The governor, when rallied on his conquest, and the prevalent rumors in the Chatham circles, seemed highly gratified and flattered, though he became at last angry to perceive that we could seriously believe he entertained the remotest idea that he intended to marry any one, and least of all Miss Chadleigh, however willing she might be in the humility of two score, to accept of his fortune and his hand.

"No, no," was his final answer. "Kate and I know each other too well. One house would never hold us."

The prospect of Governor Fox getting into parliament, had quickened Miss Chadleigh's operations. During the canvass, Lady Louisa died suddenly of apoplexy, leaving her funded property to her "beloved nephew," the major-general, and her *wardrobe* to her "dear companion and domestic friend, Miss Catherine Chadleigh." I shall not attempt to paint the rage of the proud, disappointed, and betrayed woman; for the old lady whose humors she had so long borne, and whose household she had superintended, an unpaid servant, had often, in the lulls following a squall, assured her that her interests were not overlooked.

The letter addressed by the agent of the principal legatee and sole executor, the once Honorable George, to his aunt's companion, his own early true-love, contained as polite a turning-out-of-doors as could well be couched in ten lines of English. It was delivered to Miss Chadleigh, by the same traitorous or faithful servant, who, so many years before, had disconcerted her scheme of elopement. Then he had been the valet of a cornet, now he was the butler and confidential man of a general, who, in virtue of his family interest, had several good posts. Mr. Tomkins proceeded, in right of his master, to remove the seals affixed by the Rochester attorney to the old lady's repositories, and to make inventories preliminary to the sale of every article the lodge contained;—even the old lady's pet cockatoo and tortoise-shell cat were booked.

Miss Chadleigh, by a message sent up to her chamber, was requested to remove her goods and chattels: the *wardrobe*—namely, the trumpery finery, faded satins, moth-eaten furs, and court lappets of previous generations—as soon as suited her convenience; as the lodge was already let to a friend of the Major General's and the sale was to take place immediately. Miss Chadleigh gave instant orders for the removal of her properties; but it was not clear to the legal interpreters of the will of the Lady Louisa, that the fair legatee was entitled to the walnut-tree drawers, the japan cabinets, and carved chests, containing the aforesaid wardrobe; and she was too high-spirited and too indignant to enter into debate on the point with the despised valet in brief authority. Her resolution was instantly taken; and in one half hour after she had despatched a note to Rochester by the discharged gardener, Governor Fox drove up to the gate in a chaise, to conduct her, as she had earnestly requested him, to their "friend" Mrs. Walpole's, where he understood she was invited and expected.

Miss Chadleigh was at this moment in the act of assisting a hot, perspiring servant girl, who, armful on armful, flung from a chamber window into the front court the miscellaneous contents of drawers, trunks, and wardrobes, the finery of the Lady Louisa. Miss Chadleigh's own corded trunks and piles of handboxes were already arranged in the hall.

"Are you going to open a Rag Fair with the old lady's trumpery?" inquired the governor, as he eyed, with a feeling of amusement, the tag-rag legacy of all hues and textures, fluttering upon the gravel.

"I am about to perform an *auto da fe*, governor—an act of faith, and one of purification and penance. Rake these rags closer together, Molly. Nay, use your mop, pile them higher. I claim for myself, Governor Fox, the honor of applying the torch."

The discharged servants stood by grinning; the governor was lost in perplexed amazement, while Miss Chadleigh, towering in the majesty of tragic indignation, swept by him in her gorgeous panoply of fresh black crape, bombazee, and broad heme, and fired the pile. She stood sternly looking on, till silk, satin, tissue and brocade, muslin, lawn, and lace, fell together into ashes. And so perished the Lady Louisa's legacy:—and the legatee, majestically taking the arm of the governor, led him, rather than was led by him, to the carriage.

What an evening of talk that was in Rochester, Brompton, Chatham, and even Stroud!—Maidstone heard of the cremation. The rumor by the next morning reached Canterbury, was carried by coach to Dover, and thence across the Channel, before it found its sure way into the newspapers, under the title, of *The Toady's Legacy—Curious Affair in the Fashionable World*.

"What a fury, what a vixen!" cried one party. "Such a high spirit! so noble a mind!" exclaimed another. Every one spoke in superlatives of the daring deed of Miss Chadleigh, whose instant marriage with Governor Fox was now universally affirmed, and fondly hoped, at all events, by the Chatham milliner, mercer, and perfumer, in whose books the lady stood several figures deep.

Had the governor, it was remarked, not gone in person, and carried her directly from the lodge to his friend Mrs. Walpole's cottage—where no doubt she was to remain till the ceremony took

say true vocation at this time to a Scottish matrimony. It was not wholly for nothing that the honorable George had cost his noble father £2000 at Eton. There, undoubtedly, is superiority in well-cultivated masculine intellect. At nineteen, the Etonian fairly outwitted a practised coquette of twenty-five—at least all the Chatham ladies whispered as much; and it was certain that, on the third day, the lingering runaway lovers allowed themselves to be overtaken near Nottingham, on their desultory progress northwards.

At this time, no mercy was shown to Miss Chadleigh; though from ten to fifteen years afterwards, the ladies declared, almost unanimously, that Major General Tynwald *ought* to have married Catherine Chadleigh, instead of his cousin. Until that marriage took place, Miss Chadleigh—no longer the young and beautiful, but still the *wonderfully* handsome Miss Chadleigh, whose charms had been celebrated and toasted wherever British keels plough the sea, or the Union Jack flies, and British swords hew their way to victory—had not wholly despaired, or had not formed any decided plan. If any matrimonial overtures had been cogitated, in the mean while, by transient admirers, one class of charitable female friends were ever ready to suggest, that, after her disappointment with Captain, Major, and latterly, General Tynwald, Miss Chadleigh, they were sure, would never marry; and another set, more frank and more sagacious, repeated the old sentence of condemnation on the treacherous juvenile lover, who *ought* to have married. The opinions at mess were still more decided.

Time, which had ripened Miss Chadleigh into a most beautiful and lovely girl, next into a *remarkably* handsome woman of thirty, and then into a still *wonderfully* handsome woman of thirty-eight, had made Lady Louisa an aged and widowed card-playing dowager, approaching seventy, and patched up a truce between her and her early favorite, after many years of hatred and estrangement. They were necessary to each other; and Mrs. Chadleigh could well spare from her humble home, her ambitious, chagrined, and now fearfully-tempered daughter, who vented upon her poor mother the misanthropic hatred and wrath, inspired by recent disappointments, deserved and wholly self-incurred, but not the less bitter and rankling to a proud and imperious mind thwarted in all its hopes and affections. Between this lady and governor Fox there had been almost open feud in the early period of their acquaintance; and, indeed, my frank friend had said everywhere, from the first, that Chadleigh should marry off his handsome girls as fast as possible, for they would assuredly go to the dogs else; especially Miss Kate, who, at the game of ambitious matrimony, would find young ladies were as apt to be tricked as young lords.

Though the lady had cheated him, or something like it, at cards, by her dexterous and rapid play, and ridiculed him almost to his face, for the amusement of Lady Louisa, the governor did not exult long nor immoderately in the downfall of the ambitious project of Miss Chadleigh. A part of the wrath of his naturally candid mind was even directed against the stripling lover, of whose heartlessness and juvenile depravity of mind he spoke in terms that produced a rupture of some years' duration with the Lady Louisa. However, in the rapid succession of Chatham inhabitants, the "old familiar faces" drew together again.

The Dowager Lady Louisa, and Miss Chadleigh, at last, self-invited, honored the governor's annual high banquet by their presence; and he was occasionally seen at the card-tables of the Lodge, losing a few crowns, he knew not well how, but with tolerably good grace. But the first hearty reciprocation of regard arose out of the affair of Black Sam. Both ladies were violently of the governor's faction, and both proclaimed it; and the satire and mimicry which Miss Chadleigh indulged against their mutual enemies, the *she-saints*, captivated his whole heart. Her witticisms were reported by him at the mess as faithfully as they had ever been in her most brilliant days by her young military adorers. When the governor met Miss Chadleigh shopping, he now gave her his arm home to the lodge gate, and sometimes thought himself bound in politeness to stay dinner or even to return to tea, if Lady Louisa vouchsafed graciously to invite him. At charity-balls and fancy-fairs, he became their approved squire. When rallied by the other veterans on the apparent flirtation, the governor—such is the latent vanity of man's heart—would chuckle aloud, and take as a personal compliment such sayings, as, "What would Kate Chadleigh have taken twenty years back to have been seen on the promenade *beaued* by old Governor Fox!" His turn was come then; the proud beauty, now no longer young, though still so *wonderfully* handsome, and in such brilliant preservation, had come down a peg—had descended to his level—would be glad, perhaps, to accept of him—no saying! The governor repressed the soft idea; but when any of his dowager friends hinted that it was believed a fixed thing, he only laughed the louder.

Mrs. Walpole, the most charitable, the mildest and kindest of womankind, at last thought it necessary to hint danger. It was upon a visit which Edward and I made her on a Saturday, a few weeks before we heard the false report of the governor's death, that she first spoke.

"The death of Lady Louisa will leave Miss Chadleigh, with her habits, a very helpless woman," said she, considerably; "unless, indeed, there be any serious intention of matrimony entertained by our old friend."

"No fear, mother," cried Walpole. "I know what you mean now—that Miss Chadleigh is likely to entrap the old governor; but no fear of him. He would as soon think of marrying Tippoo's mother, if there be in existence such a lady. He will die as he has lived, your single-minded, unwedded adorer:—"

'No maid will owe her scathe to him,—
He never loved but you.'

"Don't be so absurd, Edward, unless you wish to affront me. I do not blame his attentions, if the genuine motive of them be clear, to Miss Chadleigh. From her, one would believe, that he certainly entertains a serious design of proposing for her, were Lady Louisa, whom she ostentatiously affects that she never will leave—removed."

"A trick to neutralize you, mother. I do believe she imagines you will have the governor yet."

Mrs. Walpole was now really offended. "I will hold no more discourse on this subject with you, Edward. I only wished the governor's friends to comprehend, that whether such a marriage were likely to conduce to his happiness and

ate tone.—Sold your plunder to some of those sutlers, or Jew fellows—for they an't Christians—on the commissariat?"

"Ay, indeed—and them riding past me in their coaches, while I am tramping a-foot, your honor. There was a Lieutenant Chadleigh, of ours, sir—he was pay-master at the same time—by the same token I washed for his lady, and Miss ——"

"Kate?"

"The same. You knowed her then! By my faix! she was a rare one among the boys—that is, the young jintlemen of our army—and the beauty of the world at the same time. Well, her father the lieutenant got a bit of what for all the world looked like red glass—I have seen as good sold at a Donnybrook booth for a tinpenny, either as brooch or ore-rings—which he parted with to the wife of one of the sutlers, Molly Pantague by name, (whose son is now a topping man in this big town,) for ten rupees—for these were our Indiy money—a pair of shoes, and a pound of tay, and which she afterwards sould to a Jew jeweller here in London—for what thinks your honor now!—But sure there is ould Lady Wilkes stirring her stumps at long last.—Open the dure, ma'am! Mr. Richard is wanted in mighty haste, ma'am."

My old nurse if she heard the speakers below at all, had not that confidence in Peg's steadiness, and general propriety and respectability of conduct, which warranted leaving a comfortable bed upon her midnight summons. I was now dressing myself, and peeping through the blind: Peg became impatient.

"Diaoul!—saw you ever such churlish baistes as them Lon'oners to a jintleman and a stranger." And now, setting down her basket, she thundered what is called the devil's tattoo upon the door, with both her closed fists.

"To shout, *murder! murder!* now, would help us no more than calling the watch on top of Knoc Phadrig; while they lie in a sound skin themselves, you may be kilt dead on their dure-stone, and the cockney jintlewomen would not turn over to the 'tother side of them, for fare of ruffling their nice night-cap borders. If it were not that the house is part Mr. Richard's, who is a good hearted, simple, poor soul, and a jintleman every inch of him besides, his little myself would think now to smash the ould woman in a dozen of her peene—handsome, with them rotten Chiney oranges."

The implied threat, notwithstanding the saving clause, redoubled my diligence in dressing myself. With Peg I knew it was at this hour but a word and a blow. I was about the last button when Peg, with a vociferous triumphant laugh, exclaimed to her growling companion, who had at last assailed the door himself—"Stop your honor! I have it now." And she screamed, "Fire! fire! fire!" The plan was effectual. On the instant, that old familiar London cry came home to every man's bosom: windows flew up, doors opened, and nightcaps of both sexes peered out into the alley, while the watchmen gathered in. Peg was in an ecstasy of laughter at the commotion she had created. She introduced the governor to my landlady as a jintleman who shurely had some good news for Mr. Richard; and went her way, declaring the trifling piece of service was no more than she would perform by day or night for any cratur ever beat a drum for his majesty, much more for his honor, Mr. Richard's friend, who she hoped brought good news.

I was now in the hall. What could that news be! Had any harm befallen Walpole!—Was it some dreadful accident, to be broken to my niece through me?

"What has brought me at such hours to London?" was the governor's reply to my rapid inquiries. "You may ask that, egad; and also what made me alarm a decent family at these hours! But I crave your pardon, ma'am; my business with your lodger would brook no delay.—I suppose we shan't get at the lubberly lawyers for a couple of hours yet, though!"

"Lawyers!"

"Ay, just so, sir. Action of damages!—breach of promise of marriage! Damages laid at £7,000, and full costs prayed!"

"And you, defendant! and the fair plaintiff, pray!"

"Who, but that—Kate Chadleigh!" roared the governor, in a voice which shook our dwelling from cellar to garret.

It was with difficulty I refrained from laughing aloud. I was certain it was all a hoax.

"Here is what comes of elderly gentlemen flirting for years, at no allowanee, with semi-aged young ladies!"

"Don't provoke me, man:—I have sometimes more than a mind to marry the jade—keep her on bread and water—and baste her ribs every day she rises. Don't the law of England permit a man to thrash his wife?"

"To correct his wife in reason, I believe, is allowable; for so have said some of our most learned judges."

"Judge Buller, for one, a true born Englishman and sound constitutional lawyer, laid down at a western assize, I'm told, that a man might baste his wife with a switch the thickness of one's thumb."

"And the ladies of Exeter, at the next circuit, sent, respectfully soliciting the exact measurement of Judge Buller's thumb, that they might have neither more nor less of the rod matrimonial than they were by law entitled to."

"By Jove, mine should be a miller's thumb if I married Kate Chadleigh. I cannot quite bring my mind up to it—though the devil is continually putting it into my head, as the best way of having my revenge on the bold jade."

"You must resist the devil, governor, and he will flee. I question if even Judge Buller himself would approve of a man marrying for the mere purpose of being allowed to beat his wife, under sanction of the common law; for I don't suppose there is any statute to found upon. But sit down, and tell me the rights of this mad affair."

While the governor swallowed the cup of hot coffee, hastily prepared, and smoked a sedative pipe, I perused his correspondence with the attorney of Miss Chadleigh. It was on his part sufficiently energetic and laconic. I had no doubt that the whole was an infamous conspiracy to extort money, instigated by the attorney, who was the nephew of the late Lady Louisa's mercer, the principal creditor of Miss Chadleigh. Compassion for the unfortunate, the miscalculating, and, I must confess, the unprincipled beauty of past days, was with me as powerful a feeling, as anxiety to spare my old friend the ridicule which the exposures of a trial must inevitably produce.

Though there was, in reality, not a particle of sound evidence to sustain the case of the lady, it is astonishing how much plausible oral testimony

was raked together from the gossiping chronicles of Chatham. Break down it must, if it ever came into a court; but it was certainly dexterously piled up. At every new disclosure, the perfidy and treachery of the faithless octogenarian lover became more evident and more atrocious. The long course of "true love" assiduously persevered in during the latter years of Lady Louisa, was ready to be distinctly sworn to by several chambermaids, and by lady visitors innumerable; as well as her ladyship's confident expectation that "her dear domestic companion" was to be provided for at her death in an honorable marriage, which made other provision for her quite superfluous. True, there was the *auto da fe*; but this deed did not invalidate the stronger testimony borne to the governor's intentions. Had he not exulted in her spirit displayed in that action? Had he not placed her under the protection of Mrs. Walpole?

The governor's general defence was "*Denied wholly*." "The bold baggage had forced herself into the widow Walpole's cottage, the better to deceive the world, and conceal her plot to extort money:—never could she believe that he, Stephen Fox, knowing all of her which he knew, could ever dream of marrying such a hussy."

Affirmed, that even by the evidence of his man, Samuel Dixon, a negro, it could be shown that, for many months, Miss Chadleigh had, while the health of her betrothed required her tender care, almost lived in his house—and on every Sunday occupied his pew in church. The governor was at last almost distracted. He was like a man accused of witchcraft, or some impossible crime, who, seeing evidence accumulating so powerfully against him, begins at last to suspect himself of being the guilty creature which he is accused of being. But his spirit rose and cleared.

I must do the lawyers, on both sides, the justice to say that they had no doubts whatever. Miss Chadleigh's counsel saw the case even more clearly than Mr. Frankland, who was retained for the governor, as the former was in closer contact with the other parties, and saw more of their tactics. It may be presumed that the affair afforded a great deal of conversation and amusement. Walpole believed that it never could come to trial—the case, he said, had not a leg to stand upon; but Miss Chadleigh's lawyer on the other hand, placed great faith in an *English Jury*. A rich old defendant—a handsome woman, destitute and in distress—he must be a poor orator, indeed, who could not make some few thousands out of such a case. He advised compromise—paying a handsome sum down at once—the defendant could well afford it. I was also almost inclined to some trimming course. The governor, vexed as he was, possessed a better spirit. His strength lay in his obstinacy. "Suffer the vixen to browbeat me, and diddle me!—No, by Jupiter!—if my last sixpence go for it."

The important day arrived. The case was tried in London. The court was crowded to suffocation. Plaintiff and defendant both appeared personally, attended by their respective attorneys and private friends. Miss Chadleigh, well roughed, looked resplendent through her veil. Her still fine person was, to her counsel, like the dead body of Cæsar, in the Capitol, to Mark Antony. With pride and confidence he referred "the intelligent gentlemen of the jury—fathers and brothers—to

this accomplished, this lovely woman—the orphan child of one who had fought and bled in the battles of his country—wounded in woman's dearest and most tender affections—there where she had garnered up her—heart, by the caprice, the fickleness, the unaccountable, the unprovoked and cruel desertion of the sexagenarian, gallant and wealthy defendant."

If there were any truth in the Highland and Hibernian *Evil Eye*; or the *Jettatura* of the continent, this eloquent gentleman had assuredly not escaped unscathed from this exhibition. Anon the governor would dart a fiery glance at him in his mid career of professional falsehood; then wipe his brows, half rise, and suddenly plunge down in his seat, as I plucked him backwards, muttering, "D—d lies—by Jupiter Ammon! and a string of them! Let me contradict the fellow, Mr. Richard, or I shall burst!"

I was not much more at ease myself. True, Frankland had still to speak; but the "intelligent gentlemen of the jury" began so seriously to incline to the harangue of the orator—a popular favorite at the time—that I became strangely apprehensive. The day looked ill for us. I wished to my heart that we had some older, more cunning, and "used hand" than Frankland, who could pay back our opponent in his own false coin. To heighten the effect—and I can also believe that she was not wholly unmoved—Miss Chadleigh's suppressed hysterical sobs were followed by a fainting fit—which, however, did not take from her all sense and feeling; as I perceived that, when she was about to be removed, at a very critical minute, she saw and heard as acutely as she had ever done in her life. She raised herself at once, on seeing the governor's old enemy, the Baptist druggist, and a most respectable lady of Rochester, one of the governor's enemies, the she-saints, enter the court, and the former deliver a small silk-bag, such as ladies usually carry about, to my brother James, the anxious agent in this case. Governor Fox leant back on the bench, and whispered to me—

"We are dished now, by Jupiter, Mr. Richard! The crop-ear and the quean will swear I am the devil, and wear horns—if it can serve Kate Chadleigh, and make against that rampant sinner, Stephen Fox."

"Don't believe that, governor. If that lady's friends went into a court to protect your negro servant from what they believed your cruelty and oppression, they will as readily step forward to defend you from this abominable conspiracy. I cannot tell what brings them here to-day; but it must be for the sake of truth."

Frankland, to whom my brother made some hasty communication, immediately whispered the orator on the opposite side, who reluctantly paused in the full flight of his tropes, and received letters or papers from the mysterious embroidered bag.

Our eloquent opponent, whom the governor had already given to all the devils, for a brazen-faced, lying rascal—examined them with a rapid, keen, professional eye. I watched his face with intense anxiety; for I knew that—though quite likely to feel great professional pride in making much of a very bad case—he would not lend himself to a client so foolish or simple as to let his knavery be easily found out. No matter for his own opinion, or his own conviction. While the world—the "intelligent gentlemen of the jury," could be

gulled, the case was good and defensible. To look at the *morale* of any case was entirely out of the question. He looked to his brief, his fee, and his fame in the profession.

While he hastily examined the documents, Miss Chadleigh's attorney interfered; but the barrister, despite the breach of professional etiquette, waved him off. He examined the signatures of two different letters, and the post-marks, once and again; returned the papers to Frankland; and throwing his brief, or his notes, with some violence upon the table, bowed to the bench, and said aloud and emphatically, that he abandoned this case.

He flung away, the fluttering of his gown fanning the now really fainting plaintiff, and familiarly nodded to the governor as he passed, saying, in a loud whisper, "I congratulate you, Governor Fox. Had I this morning known of this case what I know now, I would never have opened my lips in it."

"Small thanks to you, sir," returned the governor, with a stiff bow. "You don't like to be found out, I see." But Frankland was addressing the bench—and I begged silence.

In brief, the jury were discharged. The attorney of the enemy, who was himself deeply implicated, attempted to bustle and bluster aside to my brother; but at the sight of his own letters, he changed color, and darted a look of fury at the wretched plaintiff, whom, in defiance of the governor's anger, I conducted out of court, and placed in a coach at the nearest stand. Neither of us spoke one word; but my fair companion trembled exceedingly. She attempted no vindication, no palliation of her conduct; nor shall I, farther than to state, that it afterwards appeared she had entered upon the prosecution with reluctance, and under the threatened horrors of a jail. This much was disclosed by the correspondence in the bag, so opportunely picked up by one of the girls of a poor widow, patronized by Mrs. —, and carried to that lady.

The carriage and horses of this lady, who proved the deliverer of the governor at his need, waited near the court. I found him making warmly grateful and polite speeches, to which she listened with placid dignity and a benevolent smile. Sometimes I could fancy that a slight fugitive ray of humor played about her lips. Una had subdued the lion.

To the lady, at parting, the governor made the lowest bow he had attempted since he attended the levee of George the Third, in 1805; and, with the Baptist druggist he shook hands with cordial frankness, hoping that, as old neighbors, they might yet be better acquainted: had he known what a d——d good fellow he was, they should have settled their old affair about the pump, over a bottle of Maderia, without those rascally attorneys. But here his conscience suggested the

horrible word which he had just employed in presence of a she-saint—of that most excellent lady. I enjoyed his perplexity not a little: and so, perhaps, did she, though she looked quite unconscious.

"You must pardon me, madam. We military men of the old school are not always quite so proper in our language as we ought to be:—but if the heart be right——"

"That is much—that is all in all," returned the lady, with her habitual benevolent and cheerful smile. Her carriage drove off for Rochester.

"And that jade, Kate Chadleigh, mimicked, ridiculed, and taught me to despise that good woman, Mr. Richard."

"And you have lived to learn that there may be worse women in the world than the she-saints," I rejoined.

"Little did I merit such kindness at her hands—though I can't abide women going about to meetings, tracts, and societies, and all that stuff:—bold hussies—and so quiet and shy all the while."

"Nor yet their coming *boldly* into a court of law, and exposing, without hope or fear, a conspiracy against the purse and character of an old bachelor, who had suffered himself to be bamboozled——"

"Hang it, man! say no more about it;—catch any gipsy taking me in again. You are grinning now at the protection of four-score;—but a man is never too old to learn wisdom."

Whether it be increase of wisdom, better society, or the sedative effects of an old age passed without pain, fear, or anxiety, I cannot say; but the improvement, the kindly ripening, and mellowing of the governor's temper, has become the subject of remark and congratulation to all his friends, and particularly to the Walpoles and myself. Sometimes a whole week will elapse, during which he and his man Sam will duly read the Prayer Book, and over the blinds watch the transit of the Dover coaches—now the governor's chief occupation—without his once launching his crutch after the long heels of the offending black.

He has lately been prevailed upon by Mrs. Walpole, and his now esteemed friend, his former "she-saint," to reinstate Mrs. and Miss Chadleigh in his will, exactly as they stood before the trial; and, of his own impulse, he went the length of presenting the latter, who was known to be in extreme want, with twenty guineas, at last Christmas—which largesse was to remain a dead secret between himself and the bearer, Sam. With him it ever will do so.—Perhaps I have said too much about my old friend:—but, in spite of his superfluous use of expletives, and frequent reference to his satanic majesty, there are many worse men talked of in the world, and figuring in books than GOVERNOR FOX.

LINES.

Now listless o'er life's sullen tide
My bark of life floats idly on;
Youth's incense-laden breeze has died,
And passion's fitful gusts are flown.

While sadly round her aimless course
Now lowering brood the mental skies,
The past but murmurs of remorse,
And dim the ocean-future lies.

And must this be! My soul, arouse!
See through the passing clouds of ill
How Fame's proud pharos brightly glows
And gilds thy drooping pennant still.

Stretch to thine oar, yon beam thy guide—
Spread to ambition's freshening gale;
Friendship and love are at thy side,
While glory's breathings swell thy sail.

Metropolitan.

THOMAS CAMPBELL'S "ADVERTISEMENT."

A CORRESPONDENT points out that the writer of "Mornings with Thomas Campbell," published in the Journal a few weeks ago, (No. 58,) has somewhat misunderstood the poet's account of his fancy for the beautiful child whom he met in St. James' Park. What the author of the "Pleasures of Hope" sent to the newspapers was the following jeu d'esprit:—

LINES ON HIS NEW CHILD-SWEETHEART,
BY THOMAS CAMPBELL.

I hold it a religious duty,
To love and worship children's beauty;
They've least the taint of earthly clod—
They're freshest from the hand of God.
With heavenly looks, they make us sure
The heaven that made them must be pure:
We love them not in earthly fashion,
But with a beatific passion.

I chanced to, yesterday, behold
A maiden child of beauty's mould;
'T was near—more sacred was the scene—
The palace of our patriot queen:
The little charmer, to my view,
Was sculpture brought to life anew.
Her eyes had a poetic glow,
Her pouting mouth was Cupid's bow;
And through her frock I could descry
Her neck and shoulders' symmetry;
'T was obvious, from her walk and gait,
Her limbs were beautifully straight.
I stopped the enchantress, and was told,
Though tall, she was but four years old.
Her guide so grave an aspect bore,
I could not ask a question more;
But followed her. The little one
Threw backward ever and anon
Her lovely neck, as if to say,
"I know you love me, *Mister Grey*;"

For by its instinct childhood's eye
Is shrewd in physiognomy;
They well distinguish fawning art
From sterling fondness of the heart.
And so she flirted, like a true
Good woman, till we bade adieu!
'T was then I with regret grew wild—
O! beauteous, interesting child!
Why asked I not thy home and name?
My courage failed me—more's the shame.

But where abides this jewel rare?
O! ye that own her, tell me where!
For sad it makes my heart and sore,
To think I ne'er may meet her more.

Our correspondent adds, that the lines were answered in a poetical address by a member of the young lady's family, who fully appreciated the honor he had done them.—*Chambers' Journal*.

THE WEDDING RING.

EMBLEM of happiness, not bought nor sold,
Accept this modest ring of virgin gold.
Love in the small but perfect circle trace,
And duty in its soft though strict embrace.
Plain, precious, pure, as best becomes the wife;
Yet firm to bear the frequent rubs of life.
Connubial love disdains a fragile toy,
Which rust can tarnish, or a touch destroy;
Nor much admires what courts the gen'ral gaze,
The dazzling diamond's meretricious blaze,
That hides with glare the anguish of a heart
By nature hard, though polish'd bright by art.
More to thy taste the ornament that shows
Domestic bliss, and, without glaring, glows.
Whose gentle pressure serves to keep the mind
To all correct, to one discreetly kind.
Of simple elegance th' unconscious charm,
The only amulet to keep from harm;
To guard at once and consecrate the shrine,
Take this dear pledge—it makes and keeps thee
mine.

From Punch.

DOG ANNEXATION.

J. POLK was put to the bar charged with robbing the Mexican minister of a favorite dog, named Texas: the circumstances of the case Don Bernardo Murphy stated to be these:—Some months since, John Polk sold his Excellency the dog, (a very large animal, spotted black and white, that used to run under carriage;) subsequently a fellow named Houston, a countryman of Polk's, who had been in his Excellency's service, absconded with the dog, and he had that day seen it at Greenwich Fair, whither he had gone in company with Chevalier Bunsen. The animal was tied to a van, belonging to the prisoner, and from which he was haranguing and psalm-singing to the company at the fair.

POLICEMAN, X. 21, said—Please your worship, there has been more picking of pockets round that ere psalm-singing wan than in any part of the fair.

MR. ABERDEEN—Silence, Policeman. What has that to do with the complaint?

The Mexican Minister continued, in a very agitated manner, "I instantly recognized my dog, and gave the scoundrel yonder in charge of a policeman."

"Scoundrel!" the prisoner cried, (a very sanctimonious looking fellow, who held the dog in his arms,)—"Am I in a Christian land, to hear myself called by such names? Are we men? Are we brethren? Have we blessings and privileges, or have we not? I come of a country the most enlightened, the most religious, the most freest, honestest, punctuallest, on this airth, I do!"

MR. ABERDEEN, (with a profound bow,)—You are an American, I suppose?

POLK—I thank a gracious mussy, I am! I can appeal to everything that is holy, and, laying my hand on my heart, declare I am an honest man. I scorn the accusation that I stole the complainant's dog. The dog is my dog—mine by the laws of heaven, airth, right, nature, and possession.

DON BERNARDO MURPHY, very much agitated, here cried out—How yours? I can swear to the animal. I bought him of you.

POLK—You did. It's as true as I'm a free-born man.

DON BERNARDO—A man who was an old servant of yours comes into my service and steals the dog.

POLK—A blessedder truth you never told.

DON BERNARDO—And I find the animal now in your possession.

POLK (cuddling the dog)—Yes, my old dog—yes, my old Texas; it did like to come back to its old master, it did!

DON BERNARDO (in a fury)—I ask your worship, is n't this too monstrous?

MR. ABERDEEN—Your Excellency will permit me to observe that we have not yet heard Mr. Polk's defence. In a British court, justice must be shown and no favor.

POLK—I scorn a defence. The dog returned to me by a lor of natur—it's wicked to fly against a lor of natur. If I sold the dog, and by the irresistible attraction of cohesion, and the eternal order of things, he comes back to me—am I to blame?—It's monstrous, heinous, reglar blasphemy to say so.

Mr. Aberdeen appeared deeply struck by the latter observation.

POLK (continued)—I did n't steal the animal—Steal! Is a man of my character to be called a thief? I annexed him—that's all. Besides, what

jurisdiction has this here court? what authority has any court on airth in a question purely American? My bargain with Don Bernardo Murphy took place out of this country—the dog came back to me thousands of miles herefrom.

MR. ABERDEEN—In that case I really must dismiss the complaint. Allow me to state my opinion, Mr. Polk, that the dog is yours; I have no business to inquire into the question of annexation as you call it, or of robbery as his Excellency here (very rudely, I must think,) entitles your bargain. I entreat rather that gentlemen so respectable should live together in harmony; and—and I wish you both a very good morning.

Mr. Polk then left the office, whistling to his dog, and making signs of contempt at Don Bernardo Murphy, who slunk away in a cab. He had not been gone an hour when Policeman X. 21, came into the office and said, "Please your worship, the Yankee annexed your Worship's Canadiaa walking-stick in the passage."

MR. ABERDEEN (sternly)—Mind your own business, fellow, Mr. Polk is perfectly welcome to the stick.

Presently another member of the force, O'Regan by name, entered and swore the incorrigible Polk had stolen his beaver hat.

MR. ABERDEEN (good humoredly)—Well, well, I dare say the hat was n't worth twopence halfpenny: and it's better to lose it than to squabble about it at law.

O'Regan left the court grumbling, and said it was n't so in Temple's time.

BOOKS RECEIVED.

Mr. Dwight's AMERICAN PENNY MAGAZINE makes its regular weekly appearance—always filled with good matter; much of it original, and all showing the marks of editorial care and judgment. This excellent family book will make more than 800 double pages in a year, for One Dollar. *Published at the Express Office, New York.*

From Messrs. Harper & Brothers:

HARPER'S BIBLE, No. 24.

MOUNT SOREL, PART 2.

ZOE. By Miss G. E. Jewsbury. We have not read this, but are informed that it is in a far different spirit from that which guided the pen of her sister.

CHARLES TYRRELL. By G. P. R. James.

WANDERING JEW, No. 11.

ENCYCLOPEDIA OF DOMESTIC ECONOMY, comprising such subjects as are most immediately connected with Housekeeping. To be completed in 12 nos. at 25 cents each, and illustrated with nearly One Thousand Engravings. This will be a treasury of knowledge upon matters of which we all feel the importance.

Messrs. Greeley & McElrath have issued the first part of the *POPULAR LECTURES ON SCIENCE AND ART*, by DR. LARDNER, of which we gave notice in a former No. This Part, price 25 cents, contains: The Plurality of Worlds; The Sun; Eclipses; The Aurora Borealis; Electricity.

The work is handsomely printed, and we are glad to see that the type is of a good size. We shall read every word of it, and recommend it especially to young people. A knowledge, even although superficial, of the principles of Natural Philosophy, is a foundation which is built upon through all after life.—It is a very profitable investment.

From the New Monthly Magazine.

THE LEFT-HAND GLOVE; OR, CIRCUMSTANTIAL TESTIMONY.

On the summit of a hill near Muhlbach, a small town of Rhenish Prussia, there is a chapel dedicated to St. Joseph. Being a place of pilgrimage, this chapel is on festival days visited by many of the inhabitants of the surrounding country; but on other days of the year it seldom happens that the sound of a human footstep disturbs the sacred solitude.

Very early on the morning of the 19th of July, 1818, a peasant proceeding to work, was wending his way along a narrow path at the foot of the hill. His dog was running before him. Suddenly the animal stopped short, and in another moment darted off rapidly in the direction of the chapel. The dog soon returned to his master, howling pitiously, and betraying unequivocal signs of terror. The peasant quickened his pace, and turned directly into the path leading up to the chapel. On coming within sight of the portal of the little edifice, he was horror-struck to behold, stretched on the steps, the lifeless body of a young man.

The terrified peasant hurried to the neighboring village with tidings of what he had seen. The news spread with the swiftness of lightning, and in a very short space of time the magistrate of the district, accompanied by the village doctor and schoolmaster, and followed by a crowd of country people, were ascending the hill in the direction of the chapel.

The body was found precisely on the spot and in the position described by the peasant. It was the corpse of a very handsome young man; part of the clothing, viz., the coat and waistcoat had been taken off, and beneath the shirt there was found a piece of cloth of a bright red color, apparently the fragment of a shawl. This piece of cloth was laid in several folds over the region of the heart. It was fastened by a band of fine lawn or cambric, which was rolled round the body, and the whole was firmly fixed by a mass of congealed blood.

On the careful removal of these bandages, there was discovered a deep wound, which had divided the carotid artery. The deceased wore light colored pantaloons, boots with spurs, and on one of the fingers there was a massive gold signet-ring. The ground round the spot where the body lay exhibited no trace of any struggle; but prints of footsteps, partially obliterated, were perceptible. These marks were traced to a neighboring wood, and in the direction of an eminence which towered above the trees, and whose summit was crowned by the ruins of the old castle of Ottenberg—a place which the neighboring country people believed to be haunted.

Whilst the doctor and others were engaged in examining the body, some of the rustic crowd mustered courage to trace the foot-prints, which apparently led to the ruined castle—their superstitious fears being doubtless lulled by the conviction that ghosts are not prone to wander in the bright sunshine of a July morning. One of the party was soon seen running back to the chapel in breathless haste, announcing that the scene of the crime was discovered. The magistrate proceeded to the ruins of the castle, and what he saw left no room to doubt that the murder had actually been committed there. The floor of the spacious aréa (once the banqueting hall of the castle) was stained with blood. The walls, the table, and the

seats, also presented similar stains. On the table were the remains of a repast which had evidently been partaken of at no very distant date, for there were fragments of bread and fruit, and a broken bottle in which some wine still remained.

On further examination, deep prints of footsteps were perceived leading from the ruins of Ottenberg to the high road of Beking, in a direction quite opposite to that of the chapel. A little further on in the same track, was found a piece of red cloth; and on comparison it was ascertained to belong to the same shawl, a fragment of which had been used to stanch the wound of the victim. At the foot of a tree lay a lady's glove, nearly new, but stained with blood. Nothing more was discovered, and in the evening the body was interred in the village churchyard, after being throughout the day exposed to the public gaze. On the following day, an innkeeper presented himself to the magistrate of the district. He had recognized in the murdered man a traveller who slept in this house on the night of the 15th of July, and who left early on the following morning. He knew neither the name nor the condition of the stranger; nor had he heard from whence he came, or whither he was going. The innkeeper observed that he had a gold watch and chain, a red morocco pocket-book, and a green silk purse; moreover, that he wore two rings, one of which he had recognized on the dead body.

An active inquiry was set on foot; but no circumstance of importance was brought to light, until about six weeks afterwards. The police then ascertained that a gentleman named Von Bergfeldt, who had been residing for some time at Coblenz, had suddenly disappeared. He came from Frankfort, and to all appearance possessed plenty of money. He had made several excursions to various parts of the adjacent country, and his journeys had extended as far as the mountains of the Vosges. An old soldier, who had been his servant, and the proprietor of a house which he had hired, came to Muhlbach; both had a perfect recollection of the watch and the two rings remarked by the innkeeper; the servant positively affirmed that the boots found on the dead body belonged to his master.

Several months elapsed, and public interest, which had been powerfully excited by this mysterious event, was gradually subsiding, when a gentleman of rank, travelling to the waters of Podewil, happened to pass through Muhlbach. Hearing of the murder, he was struck by the name of the victim—Bergfeldt being the name of one of the most ancient and noble families in Silesia. He knew their armorial bearings, and he expressed a wish to see the signet-ring which had been found on the body. The engraved coat-of-arms was identical with that of the Silesian Bergfeldts: viz., quarterly sable and azure, on a Chief Or, a serpent between two bees.

The *ober-procurator* of Muhlbach lost no time in addressing a letter to the authorities of Breslau.

An answer was speedily returned enclosing a letter signed Ferdinand von Bergfeldt, the writer of which described himself as being the second son of the old Baron Franz von Bergfeldt. He stated that his elder brother, had about two years previously, left home to make a tour in various parts of Europe, and that the family had received no intelligence of him for a very considerable time.

“Every circumstance,” pursued the writer of

the letter, "leads to the supposition, that the victim of the recent murder is no other than my unfortunate brother. Our family has the greatest interest in elucidating this mystery, inasmuch as our patrimonial estates are entailed on heirs male. My brother was married, but had separated from his wife, by whom he had a daughter, who died in infancy. I shall set out forthwith for Muhlbach."

Ferdinand von Bergfeldt arrived at Muhlbach in December, he examined the effects of the deceased, and the documents relative to the examination of witnesses. It appeared evident, beyond doubt, that his brother had perished by the hand of a murderer; but, nevertheless, it was requisite he should be provided with an attested certificate of his death, before he could take possession of the inheritance which would devolve on him as next heir, at the decease of his then very aged father.

He engaged the assistance of the advocate Schelnitz, a lawyer of justly reputed intelligence and activity; and with him he proceeded to Coblenz. The mystery of the case, the important interests involved in it, and the rank of the family, all contributed to stimulate the zeal of Schelnitz, and he speedily brought to light certain facts which promised to lead to the detection of the criminal.

Ferdinand and the lawyer visited the house which had been occupied by Edward von Bergfeldt at Coblenz. Seals had been affixed to all the drawers, trunks, &c., and, on a careful examination of the effects, there was found in the pocket of a coat a note written in French. The address had been torn off, but the note was as follows:—

"I grant the interview on condition of its being the last. Your threats can never intimidate me. I defend myself with the arms of virtue and honor. This is my last communication. Secret correspondence must not continue.

"July 13th."

As soon as Ferdinand von Bergfeldt perused this note, he felt convinced that he was on the right track for the discovery of the murderer.

"It has been conjectured," observed he, "that robbery was the motive for taking my brother's life—no such thing! I feel assured that the fatal blow was struck by a female hand—the same hand to which the glove belongs, and the same hand which traced this note. Every one of our family are aware that my brother did not behave well to his wife; and that his conduct caused them to separate shortly after their marriage."

The active inquiry now set on foot brought to the knowledge of the magistrates various circumstances worthy of attention.

A country girl deposed that, whilst she was engaged in cutting wood in the neighborhood of the castle of Ottenberg, on the morning of the 16th of July, she had seen a gentleman in a hunting-dress walking with a lady. She described the lady to have worn a straw bonnet, a bright-colored dress, and to have carried a parasol.

The keeper of the baths of Podewil, near Muhlbach, furnished testimony somewhat more important. He stated that, about noon on the 16th of July, a lady elegantly attired, but pale and evidently suffering from fatigue, came to the door of

the bathing establishment, and wanted some person to tie a bandage round her right hand, which she said she had accidentally cut. The wife of the bath-keeper washed and bandaged the wound. The cut was long, but not very deep, and appeared to have been inflicted with a knife. The lady requested to have a clean white handkerchief, which was furnished to her; she left a ducat in payment, and went away hurriedly. An old man, dressed like a wood-cutter, had been observed waiting for her at some distance, and, the lady having joined him, they went away together. From the evidence of a person living near the baths, it appeared that, being at work behind a hedge, he had heard a short colloquy between the lady and her guide. The former was weeping and appeared greatly distressed. The old man said to her, "In the name of Heaven, madam, be calm! Tears cannot recall the dead to life: from me you have nothing to fear—I will be silent—silent as the grave!"

These witnesses described the lady to have had a light-colored parasol, a straw bonnet trimmed with flowers, and a green silk dress.

Ferdinand von Bergfeldt now entertained no doubt that the investigation would speedily lead to a satisfactory result. In a letter, which he addressed to the magistrate of Muhlbach, he said, "We shall soon unravel the truth. We have the glove, and it will not be long ere we have the hand. It is a right-hand glove, and, on turning it inside out, I have made a discovery which has heretofore escaped observation. In the inside is written a name, part of which is obliterated, the letters *Henr—F—ke*, being all that are legible." But was this the name of the wearer or the maker? With the view of solving this question, the glove was transmitted to an experienced agent, who had orders to spare no exertions for the elucidation of the fact.

At this juncture an unexpected circumstance intervened. A festival day was at hand, and in preparation for it the chapel of St. Joseph was swept and cleaned. The box destined for receiving donations for the poor was opened; within it was found a green-silk purse, containing a considerable sum in gold and silver, together with a slip of paper, on which were written the following words: "Give the dead man Christian burial, and Heaven will reward you!" It will be recollected that the inn-keeper had seen a green-silk purse in the hands of the stranger who had slept a night in his house. He was shown the purse found in the poor-box, and he identified it as the same.

Meanwhile, Ferdinand von Bergfeldt received letters from Silesia, acquainting him with his father's sudden death. He hurried home without delay. He was aware that in the event of his brother Edward's death being proved, it would be necessary that he should go immediately to Berlin to obtain the requisite authority for entering into possession of his inheritance. In this matter he counted on the support of his sister-in-law; as the widow would be entitled to an annuity much more considerable than the sum she had received as alimony since her separation from her husband.

Ferdinand von Bergfeldt was not on friendly terms with the family of his brother's wife. Some overtures for effecting reconciliation between the husband and wife had been obstinately opposed by the father of the lady, General Count Hildenrath. This circumstance had, in no slight degree, wounded the pride of the Bergfeldts.

On the 28th of June, 1819, Ferdinand arrived in Berlin, and he lost no time in visiting General Hildenrath, by whom he was not received in a very cordial manner. Edward's widow, Charlotte von Bergfeldt, was from home. Whilst Ferdinand was relating to the general all that he had learned respecting his brother's death, a carriage stopped at the door, and in a few moments Charlotte entered the drawing-room. At sight of Ferdinand, who advanced to meet her with respectful interest, she turned deadly pale, staggered, and seemed on the point of falling, but as if by a sudden effort recovering her self-possession, she courtesied and withdrew. Ferdinand was vexed at this behavior, which he regarded as an unequivocal sign of animosity, and after a little further conversation with the general he took his leave.

He subsequently saw Charlotte several times, and though she did not seek to avoid him, yet she behaved with coolness and reserve. Though she had just ground of complaint against her husband, yet she rendered the due tribute of regret for his sudden and unfortunate death. About the end of August, Ferdinand received a letter from Schelnitz, which was in substance as follows:

"I have some particulars to communicate, which appear to me to be of the utmost importance, and to which I beg your earnest attention. In the first place I have to inform you, that we have found the *left-hand glove*. The name Heinrich Finacke is legibly written in the inside. It is supposed to be the name of the manufacturer, and we have taken measures for ascertaining this fact. The glove was discovered in the following manner: In the course of his investigations, the police agent, who had possession of the right-hand glove, showed it to a milliner of Muhlbach named Mademoiselle Enkel. A lady named Raumer, who was a customer of the milliner, happened to see the glove, and examined it attentively. This lady knew that I was engaged in investigating the affair of the murder at Ottenberg. Three days afterwards, Mademoiselle Raumer called on me and presented me to the *left-hand glove*. This lady is an intimate friend of the family of the Protestant Pastor Gaeben. She related to me that, one day whilst she was visiting the daughters of that clergyman, a discussion arose on some point of dress, and one of the young ladies having opened a drawer to search for something, accidentally drew out a glove, which fell at the feet of Madame Raumer. On picking it up, she perceived something written in the inside, and she mechanically read the name *Heinrich Finacke*.

"Where did you get this glove, my dear Caroline?" inquired Madame Raumer.

"From the *femme de chambre* of a lady who was here last summer from Berlin," was the reply.

"I lost no time," added Schelnitz, "in writing to the Pastor Gaeben, and he called on me this morning accompanied by his daughter Caroline. They were very uneasy lest the discovery of the glove, a circumstance in itself so trivial, should place them in an unpleasant position. I tried to dispel their apprehensions, and begged the young lady would tell me candidly how the glove came into her possession.

"She informed me that a young widow lady, Madame Weltheim, a resident of Berlin, had some time ago been on a visit to Baron Schonwald, at his castle, near Muhlbach. Caroline, who was a good musician, frequently went to the castle to sing, and accompany the lady on the pianoforte.

When Madame Weltheim was about to leave the castle, Caroline assisted the *femme de chambre* to pack up. In a small box, filled with ribbons, flowers, and other trifles, the glove was found. Being an odd one, the lady's maid threw it on the ground as useless. Caroline, admiring the small size and elegant form of the glove, picked it up and said she would keep it as a memorial of Madame Weltheim. I am fully convinced," pursued Schelnitz, "that all the young lady has stated is strictly true."

"You remember the letter written in French which was found among your brother's effects. Its signature was the letter C. Now I am informed that Madame Weltheim's *femme de chambre* was a French girl, and that her name was Cecile. You will, no doubt, be struck with this coincidence. Cecile is described as tall and slender; Caroline Gaeben is, on the contrary, of short stature. All that I can learn of Madame Weltheim is, that she is a lady of good family, and moves in the best society of Berlin."

It is strange, thought Ferdinand, when he had finished reading the letter, that Schelnitz should attach so much importance to coincidences which seem to me the mere result of chance. He went out to call on Count Hildenrath, with the intention of communicating to him what he had learned. The count was from home, but the countess, who had just arrived from the country, received him with great kindness. She was full of curiosity respecting the murder, and pressed Ferdinand to inform her of all the particulars.

"Your brother was buried near the spot where his body was found, I believe," said the lady.

"Yes, madam, his ashes repose in the little village churchyard, not far from Muhlbach."

"Muhlbach!" exclaimed the countess. "Oh! what would have been poor Charlotte's feelings had she known that. She was not far from Muhlbach at the time."

"How, madam! Was my sister-in-law near Muhlbach?"

"She was passing some time at the castle of Baron Schonwald, which is only a few leagues from Muhlbach. Don't you know Baron Schonwald? He is a very pleasant man, only so exceedingly fond of hunting. And the baroness—she is quite an oddity! In her youth she was one of the maids of honor to the electress! There was no King of Saxony in those days. But everything is changed now; and as I was observing a day or two ago to my friend Madame Schlichtegroll, I don't know what we have gained by all these changes!"

In this way the loquacious old lady gossiped for some time, unheeded by Ferdinand, who was absorbed in profound reflection.

"How!" thought he to himself; "Charlotte so near the scene of the crime, and we not know it! She and her father have been silent on a fact of which they ought to have apprized me the very first moment I was in their company!"

He took leave of the countess, and returned in a very pensive mood to his hotel. He once more read the letter of Schelnitz, and pondered on every line of it. Another initial C. had now come to light. Was it the one they were in quest of? Could the accusatory glove belong to Charlotte! Had she assumed the character of a widow with the false name of Madame Weltheim! These and a thousand other perplexing thoughts and suspicions haunted the mind of Ferdinand throughout the night.

Next morning he again repaired to the hotel of Count Hildenrath. He found the countess and her daughter together in the drawing-room. The conversation naturally turned on the legal inquiries which were going on for the verification of his brother's death. Charlotte at first betrayed no sign of embarrassment or uneasiness.

"I believe, madam," said Ferdinand, "you are acquainted with the family of Baron Schonwald, who reside near Muhlbach?"

"I have some slight acquaintance with them," replied Madame von Bergfeldt.

"Do you happen to know the daughter of the Pastor Gaeben, who lives in the neighborhood of the castle?"

"He has several daughters."

"I mean the second daughter; Caroline, I think, is her name."

"Yes, I know her. She is a charming girl, and a great favorite of mine."

"I have just learned that she is implicated, in a very serious way, in the horrible affair which we are investigating. The police has discovered—"

"What! What has been discovered?" exclaimed Charlotte, her eyes staring wildly, and her cheeks turning pale. "Can it be possible! Poor Caroline! She is innocent—quite innocent! I will go immediately to Muhlbach—I must save her!"

She sank on the sofa, apparently in a state of unconsciousness. The countess rang the bell violently, and, the servants having come to her assistance, Ferdinand hurriedly rushed down stairs, and left the house.

"The mystery is revealed," thought he. "Charlotte undertakes to prove the innocence of Caroline! This is equivalent to admitting that she knows the author of the crime! Discovery is now at hand. I need not stay longer in Berlin."

He was about to order post-horses for the purpose of departing, but in the course of the afternoon, a note was delivered to him. It was from Charlotte, who wished to have a private conversation with him.

Madame von Bergfeldt received her brother-in-law with the most perfect composure, though she had not entirely recovered from the emotion which had so suddenly overcome her in the morning. She was very desirous to know what was the charge against Caroline Gaeben, and what discovery had implicated her.

Ferdinand evaded these questions by observing that the letter he had received from Schelnitz was very vaguely expressed; and that, though he stated that serious suspicions hung over the pastor's daughter, he had not stated the circumstances on which they were grounded. Charlotte informed him that it was her intention immediately to set out for Muhlbach, where she could produce testimony to prove the innocence of her young friend. Her mother was to accompany her; the count, who was suffering from severe illness, being unable to undertake so long a journey. This plan entirely coincided with Ferdinand's wishes. Resorting to a pardonable dissimulation, he pretended that it was his purpose to return home to Silesia immediately. That same night, however, he left Berlin, and took the road to Muhlbach, with the view of reaching that place before the arrival of his sister-in-law.

On reaching his destination, the first thing he did was to call on Schelnitz, to whom he communicated all that had transpired at Berlin.

"I have a few additional particulars to relate to you," observed the lawyer; "I have collected them from a domestic who recently quitted the service of Baron Schonwald. The 16th of July was a Saturday; it was a festival day, and the Schonwald family went to Muhlbach. Madame Weltheim did not go with them, but she went thither in company with a lady (Madame Rosen) and her two daughters. The party reached Muhlbach in the morning, and about eleven o'clock in the forenoon Madame Weltheim left her friends, and did not rejoin them again till evening. Now," observed Schelnitz, "it would be very important to ascertain where she went and how she was employed during this interval of absence. The Schonwalds and the Rosens might possibly furnish information on that point; I therefore advise you to see them. Madame Rosen wishes to dispose of her estate. You may present yourself as a purchaser. By that means you will be sure of a favorable reception. Draw the ladies into conversation, and try to learn from them all that took place on the 16th of July."

Ferdinand followed this advice. He learned from Madame Rosen that, whilst the ladies were breakfasting at Muhlbach, a country girl brought a letter for Madame Weltheim. She stated it to be from a very old friend, a Madame Treskoff, who resided in Muhlbach, and who wished particularly to see her. Madame Weltheim hastily put on her bonnet, and departed, followed by the girl. It was night, and candles were lighted, when she returned. She seemed agitated, and the redness of her eyes denoted that she had been weeping. The ladies anxiously inquired the cause of her trouble, and she replied that her feelings had been deeply moved by finding her friend, Madame Treskoff, in great distress.

Continuing his interrogatories, Ferdinand was further informed, that though Madame Weltheim frequently wore a green silk dress, yet it was not positively remembered whether she wore it on the 16th of July.

"She was much agitated on her return," observed one of the ladies, "and she had *only one glove on*. (These words made Ferdinand almost leap from his chair.) This struck me as very remarkable, as she was always most precise in the details of her dress. I remarked to her that she had only one glove, to which she replied, 'Ah! I was not aware of it. I suppose I must have dropped it at my friend's!'"

Ferdinand had thus learned more than he expected. Taking a hurried leave of Madame Rosen and her daughters, he went immediately to Schelnitz. The latter was of opinion that nothing now remained to be done but to denounce Charlotte von Bergfeldt as the murderess of her husband. He inquired in Muhlbach and its neighborhood whether a lady named Treskoff had lived there in the month of July. Her name was unknown to any one.

"There can be no doubt," said Schelnitz, "that Charlotte von Bergfeldt struck the fatal blow. It is useless to endeavor to sound the motives for a crime which Providence has miraculously disclosed by an unparalleled chain of concurring circumstances. She may have been prompted by jealousy—by hatred of a husband whose conduct it would appear was not free from blame—or by cupidity; for, on the death of Edward von Bergfeldt, his widow, by the terms of the marriage settlement, is to possess a considerable portion of the

revenues derived from the estates. But, whatever may have been the motive for the crime, Charlotte von Bergfeldt is certainly guilty."

The minutes of the evidence for the prosecution were drawn up in due legal form, and laid before the *ober-procurator* of Coblenz. Meanwhile, Madame von Bergfeldt, accompanied by her mother, arrived there. Full of anxiety to know what proceedings had been taken against Caroline Gaeben, she called on Schelnitz, whose name and address she had learned from Ferdinand. Schelnitz referred her for information to the *ober-procurator*, to whom he immediately conducted her.

"Madam," said the magistrate, addressing her, "your brother-in-law has charged Caroline Gaeben with being implicated in the murder of your husband. He assures me that he can produce satisfactory proofs of her guilt; but he has not stated to me what those proofs are. I understand that you have come here for the purpose of removing the suspicions which hang over that young lady."

"I have, sir; but I cannot conceive how suspicious can possibly attach to Mademoiselle Gaeben. She did not know my husband. She never even saw him!"

"How can you be certain of that, Madam? You cannot know whom your husband may have seen during your separation from him. How long is it since you yourself saw him?"

Charlotte felt that she was approaching dangerous ground.

"The will of my parents," said she, "prohibited all communication between me and the Baron von Bergfeldt after our separation; I do not consider it necessary to enter upon any further explanation on that painful subject."

Resolved, if possible, to elicit something decided, the magistrate, fixing his eyes sternly on her, inquired whether she had not visited Muhlbach on the 16th of July in the preceding year.

"Yes, sir," she replied, "I think I was there on that day."

"How did you employ your time during the morning?"

Charlotte was silent, and a livid paleness overspread her countenance.

"Madame Rosen and her daughters," pursued the magistrate, "have declared that you parted from them at an early hour, and that you did not rejoin them until evening."

"I cannot understand," said Charlotte, in a faltering tone of voice, "why those ladies have been examined; nor can I guess to what all these inquiries tend."

"Permit me to observe, madam, that you have not answered the question I just now put to you, and that an answer is necessary for your justification!"

"For my justification! Then it appears I am accused! I now understand the meaning of this captious interrogatory. I will not condescend to enter upon explanation. That would be beneath me. I will remain silent. Henceforth my lips are sealed on this subject. No power on earth shall draw a word from me. Now, sir, do whatever your duty may dictate! You know my determination."

The magistrate found himself obliged to sign an order for the imprisonment of Madame von Bergfeldt. Next day she was confronted with the keeper of the baths at Podewil and his wife. Both unhesitatingly recognized her to be the lady who, on the 16th of July, had presented herself at the

door of their establishment. Her right hand was examined, and across the palm there was a mark which might have been caused by a cut; but the scar was so slight as to render this circumstance a matter of doubt.

An order was forwarded to Berlin for putting under seal all the papers and effects belonging to Madame von Bergfeldt. They were previously examined in the presence of a magistrate. Among the papers nothing of importance was found, but in a jewel casket there was discovered a gold watch, which the accused lady had presented to her husband on his marriage, and a ring which Edward had been in the habit of wearing. How did these objects come into Charlotte's possession? Had her husband returned them to her at the time of their separation? These questions could be answered only by conjecture.

All this mass of evidence having been submitted to the consideration of the judges, the officers of police were directed to seek out three persons whose testimony appeared to be important. These were the old woodcutter, who accompanied the lady when she called at the baths of Podewil, Cecile, the French *femme de chambre*, and the country girl who had conveyed the letter to Madame Bergfeldt (under the name of Madame Welthiem) at Muhlbach. The woodcutter was nowhere to be found. As to Cecile, she had quitted her mistress' service on her return to Berlin, and was now married. In countenance and figure she was totally different from her mistress. No suspicion attached to her, and she could furnish no information calculated to throw light on the subject of inquiry. The girl who brought the letter to Madame von Bergfeldt was traced out, and she stated that, in 1818, she was in the service of a Madame Wunderlich at Muhlbach. She recollected that some time in the month of July a gentleman called on her mistress, who then desired her to take a letter to a lady, whose name she had forgotten. After reading the letter, the lady went with her to Madame Wunderlich's. The girl described the gentleman to have been tall and thin, with dark moustaches. He wore a green hunting-coat, light-colored pantaloons, and boots with spurs. This description corresponded with the appearance and dress of Edward von Bergfeldt.

These examinations being terminated, the case was deemed to be sufficiently established to warrant an order for the trial of the accused before the criminal court of Coblenz.

On the day fixed for the trial, an immense crowd thronged every avenue leading to the court. Madame von Bergfeldt was conducted into the presence of the judges. She was dressed in deep mourning, looked very pale, and, though evidently deeply affected, she was still struggling to repress her emotion.

The witnesses, forty-three in number, were examined. Their testimony confirmed all the particulars already narrated, and though no new facts were disclosed, yet the interest excited by the trial continued to increase. At the close of the examinations the advocate for the accused entered upon her defence. He delivered a long and eloquent address, in the course of which he ingeniously set forth every argument that could turn to the advantage of the prisoner. He dwelt earnestly on the fact of there being no positive proof that the body found on the steps of St. Joseph's Chapel was the body of Edward von Bergfeldt. Referring to the annals of criminal jurisprudence,

he adduced the cases of several persons who had on circumstantial evidence been condemned and executed for murder, and whose presumed victims were subsequently discovered to be living. He concluded by expressing regret that the accused had determined to remain silent under the charge brought against her, and to withhold all explanation respecting the events of the fatal day; but, unaccountable as that determination was, he observed, that it ought not to be regarded as an evidence of guilt.

The advocate had just closed his address, when a messenger hastily entered the court, and presented a billet to the president, which the latter read aloud. It contained the following words:—

"I entreat to be heard immediately. I can prove the innocence of the accused!"

"Let the person be brought into court," said the president.

The utmost curiosity and agitation now prevailed, and several voices were heard to exclaim, "Doubtless it is Edward von Bergfeldt!"

The unexpected witness presently appeared. He was a man of tall stature and of military bearing. As soon as Charlotte beheld him she uttered a piercing shriek. Having, not without some difficulty, made his way through the crowd, the stranger at length stood before the judges.

"My name," said he, "is George von Rothkirch, and I am an officer in the 3d Dragoons. That lady, whose innocence I am enabled to prove, is bound by an oath which compels her to remain silent. I beg permission to address a few words to her, and afterwards I will satisfactorily explain the mysterious event which occupies the attention of this assembly."

The president consulted the court, and the stranger was permitted to speak to the prisoner.

"Madam," said he, "death has broken the bond by which you believed yourself to be bound. Your father is no more. He died invoking blessings on you, and in ignorance of the dreadful position in which you are placed. Permit me now to reveal the truth."

Charlotte replied by a look of gratitude and a flood of tears, and George von Rothkirch, spoke as follows:

"Being in garrison at Coblenz in 1818, I met Edward von Bergfeldt, with whom I had formerly been acquainted. He then appeared ill and low-spirited, weary of life, and dissatisfied with himself. He spoke to me unreservedly of the differences between himself and his wife, acknowledged that he had not behaved well, but wished for reconciliation. I visited the family of Baron Schonwald, at whose house I met a lady, who was introduced to me as Madame Weltheim. I was charmed with her beauty and intelligence, and frequently spoke of her to Edward. He wished to see the lady whom I so highly extolled; but I could not prevail on him to accompany me to Baron Schonwald's. At length I had an opportunity of pointing out Madame Weltheim to him on a public promenade.

"My dear Rothkirch," he exclaimed, "she is my wife!"

"He insisted on my conveying to her a proposal for reconciliation. Madame von Bergfeldt at first refused to listen to it, alleging that her parents would never forgive her if she saw or corresponded with her husband; at length, however, I succeeded in shaking her determination, and she consented to grant him an interview.

"It was arranged that, on a certain day, when she was to go to Muhlbach with some friends, an imaginary person, to whom we gave the name of Madame Treskoff, should send a message requesting to see her. She was then to join me at the residence of a lady in Muhlbach, and I was to conduct her to the castle of Ottenberg, where her husband had promised to be in waiting for her.

"On meeting her husband, Madame Bergfeldt was evidently agitated by painful emotions, which she vainly struggled to repress. Edward, on his part, was exceedingly gay and animated; he had brought with him a wood-cutter, who carried a hamper, furnished with a *déjeûner*. The husband broached the subject of reconciliation, which the wife endeavored to evade on the ground of the objections of her parents. The dialogue became warm, and reproaches were mutually interchanged. Edward complained of the heat, which was indeed excessive, and he frequently had recourse to the wine, of which he drank very freely. I observed that he was becoming greatly excited, and he even went so far as to utter threats of vengeance, if his wife did not accede to his offers of reconciliation. Madame von Bergfeldt wished to depart, but he seized her by the arm and detained her.

"Ah!" he exclaimed, "would you doom me again to the miserable life I have suffered for some years past; sooner will I end my days—" and seizing a knife from off the table, he made a motion as if intending to stab himself.

"Edward," said I, "why terrify your wife by acting this farce?"

"Farce!" resumed he, in a tone of furious anger, "do you suppose I fear death?"

"By a movement more rapid than thought, he plunged the knife into his heart. He fell at my feet deluged in blood, and Charlotte fainted.

"The wood-cutter, who had been sitting at some distance off, now ran to us. Edward was a lifeless corpse. With some difficulty we recovered Madame von Bergfeldt, who, in this terrible crisis, evinced great energy and feeling. It was long before we could prevail on her to abandon the lifeless remains of her husband, for whom she was most anxious to secure a fitting burial. The wood-cutter suggested the idea of placing the body on the steps of the chapel, where, he said, it was sure to be speedily discovered. We removed some of the clothing, being desirous of creating the suspicion of murder rather than of suicide. Charlotte wished to have her husband's watch and ring which he wore; he had a second ring, but we found we could not remove it without mutilating the finger. We bandaged the wound, in order to stop the effusion of blood, and then withdrew. Madame von Bergfeldt cut her hand slightly in her endeavor to snatch the knife from Edward; she was dreadfully agitated by the horrible scene, and reproached herself for having caused the catastrophe by violating her father's injunctions.

"But," said she, "he shall never know what has happened—it would break his heart. Whatever may be the result—even though I should die on the scaffold—so long as my father lives, I will bury the knowledge of this sad event in inviolable silence!"

"She made me and the woodcutter take a solemn oath never to divulge what we had witnessed.

"Shortly after this event, my regiment was removed from Coblenz to a distant garrison. I

heard nothing of Madame von Bergfeldt, and I dared not write to her. A short time ago, I retired from the army, with the intention of proceeding to the United States, where my brother has long resided. Passing through the Rhenish Provinces, on my way to the port at which I proposed to embark, I heard of this trial: the whole truth instantly flashed across my mind, and I at once understood the chain of mysterious circumstances which had fixed suspicion on Charlotte von Bergfeldt. I hastened to Baron Schonwald, who related to me all he knew of the case, and showed me a letter which he had received only a day or two ago, announcing the death of Count Hildenrath. There was not a moment to be lost, and I hurried hither. Death has released me from my oath, and will, I trust, induce Madame von Bergfeldt to break the silence she imposed on herself."

He gave the name and dwelling-place of the woodcutter, who, being found, confirmed the accuracy of his statement. The court then immediately pronounced the acquittal of Charlotte von Bergfeldt.

A gentleman who happened to be present at the extraordinary trial above described, was, in the month of August, 1820, a temporary resident at the Hôtel d'Angleterre at Havre. One day, as he was passing down the staircase of the hotel, he met a lady whom he immediately recognized to be Charlotte von Bergfeldt.

"Who is that lady?" inquired he of one of the waiters, whom he saw in the hall.

"She is a German lady," was the answer; "her name is Madame von Rothkirch; she and her husband arrived here the day before yesterday, and they are to sail to-morrow for New York on board the Quincy Adams."

From the Examiner.

History of the Consulate and the Empire of France under Napoleon. By M. A. THIERS, late Prime Minister of France. Translated by D. FORBES CAMPBELL, Esq., with the sanction and approval of the Author. Vols. 1 and 2. Colburn.

THE extraordinary and unexampled interest which this book has excited in France, is not likely to have more than a faint reflection in England. The fifteen years of Napoleon's absolute rule, his foreign triumphs, his domestic magnificence, are still to Frenchmen the most glorious France can boast of. But we hope there are few Englishmen who think them other than a most disastrous experiment, which too long overshadowed the liberties and happiness of the world.

Whether the time has come to write the history of those years; whether it is yet possible to write it, without fear or favor; whether existing relations to still living and active interests, do not absolutely require that some errors should be extenuated, some faults glossed over, and some crimes palliated: are questions that will not be felt less strongly after Monsieur Thiers' opening volumes are read. Of his great and singular ability, they are a new and convincing proof. His high administrative talents; his wonderful clearness and facility of detail; and that quality of calm, cold, eloquent good sense which makes his oratory in the Chamber of Deputies as unassuming as it is powerful; are prominently impressed on this first and second volumes of the history. But even here, though we get no further than April

1801, we observe painful inconsistencies incident to the subject. The old editor of the *National* seems not a little put to it, among the disputes of the First Consul and his colleagues, to show how a Constitution dictated for glory and convenience, differs from one imposed for direction and control.

But perhaps it is ungrateful to object on that point; for, out of the confusion, M. Thiers rushes in self-relief to this eulogium on our English representative monarchy.

"Representative monarchy, it must be confessed, has, with less trouble and effort, by trusting more to human nature, procured, for two centuries past, an animated but not subversive liberty, for one of the first nations of the world. Simple and natural in its means, the British constitution admits of royalty, aristocracy, and democracy; then, after admitting them, it suffers them to act freely, imposing upon them no other condition but to govern by common consent. It does not limit the king to this or that act; it does not draw him forth by election, to plunge him back afterwards; it does not debar the peers from active functions; it does not deprive the elective assembly of speech; it does not grant universal suffrage, to render it null afterwards by rendering it indirect; it allows royalty and aristocracy to spring from their natural source, hereditary succession; it admits of a king, of hereditary peers, but, on the other hand, it leaves the nation to choose directly, according to its tastes or its passions of the day, an assembly which, empowered to grant or to refuse to royalty the means of governing, thus obliges it to take for directing chiefs of the government those men who have contrived to gain the public confidence. All that Sieyès, the legislator, was in search of, was here accomplished almost infallibly. Royalty, aristocracy, act no more than he wished; they merely moderate too rapid an impulsion: the elective chamber, full of the passions of the country, but checked by two other powers, chooses, in fact, the real leaders of the state, raises them to the government, upholds them in it, or overthrows them, if they have ceased to correspond with its sentiments. Here is a simple, a true constitution, because it is the production of nature and of time, and not, like that of M. Sieyès, the scientific but artificial work of a mind disgusted with monarchy by the reign of the last Bourbons, and filled with dread of a republic by ten years of storms."

As for the "novelty of the ideas," and the "skill of the contrivances" in the constitution finally devised by Bonaparte, it was hardly a matter of novelty or contrivance to cover with a veil so thin, a government essentially despotic and military, a government of undisguised force. M. Thiers cannot disguise from himself that such was the aim and achievement of Napoleon after the fall of the Directory; yet he discusses the Constitution of the 15th of December with every imaginable gravity.

It is a leading purpose of the history, and doubtless with good reason, to elevate the military glory of France. Yet the historian and man of genius cannot help reminding his readers, more than once, that there are more durable things, and more difficult of attainment, than military glory. He describes the oration pronounced before Napoleon on the occasion of Washington's death, and observes how poor it was, notwithstanding the greatness of the people engaged in it, compared with "those funeral scenes at which Louis XIV. was wont to be present."

"What, then, was wanting to render this solemnity truly grand? There was wanting what the greatest of men himself could not infuse into it; there was wanting, in the first place, religion; not that which men affect and strain to possess, but that which is sincere and spontaneous, and without which the dead are always but coldly celebrated; there was wanting the genius of Bossuet, for there are species of greatness which never reappear in nations, and if the Turennes and the Condés have successors, the Bossuets have none; lastly, there was wanting a certain sincerity, for this homage to a hero renowned above all for his disinterestedness was too visibly affected."

Too visibly affected indeed! The ceremony of this Washington oration preceded, by only ten days, Napoleon's lodgment at the Tuileries.

The principal military incidents in the first volume are Massena's distress in Genoa, and the blockade of that ill-fated city (admirably described, but with enormous, though of course very natural *French* sympathies); and the campaign of Marengo. Nothing could have been told more picturesquely than the passage of the Alps. Here the ease and charm of the narrative are very great. But surely the lucky chance of the battle of Marengo is a little overdone. Heliopolis and Hohenlinden are the campaigns of the second volume; and, the first especially, are treated with consummate skill, and, for matters known so well, marvellous freshness. But before we offer any further remark, let us show the variety, sagacity, and power of treatment which M. Thiers exhibits, by a few selected examples.

His anecdotes are brief, striking, and always well told: though we think he rejects Bourrienne's authority too often (had he overlooked, in reference to the battle of Marengo, the Secretary's famous battle of the pins!) Here is a narrow escape of Bonaparte from the famous Chouan chief.

NAPOLÉON AND GEORGES CADOUAL.

"When he was conducted to the Tuileries, the aide-de-camp ordered to introduce him conceived such apprehensions from his look, that he deemed it unsafe to shut the door of the first consul's cabinet, and went every now and then to steal a glance at what was passing. The interview was long. In vain General Bonaparte addressed the words 'native country and glory' to the ears of Georges; in vain he held out even the bait of ambition to the heart of that fierce champion of the civil war; he had no success, and he felt convinced himself that he had failed when he looked at the face of his visitor. Georges, on leaving him, set out for England with M. Hyde de Neuville. Several times, when giving his fellow-traveller an account of this interview, he exclaimed showing his vigorous arms, 'What a blunder I committed in not strangling that fellow!'"

Here a specimen of the military portraits:

KLEBER AND DESAIX.

"Kléber was the handsomest man in the army. His lofty stature, his noble countenance, expressing all the pride of his soul, his valor at once intrepid and cool, his quick and solid intelligence, rendered him a most formidable commander on the field of battle. His mind was brilliant, original, but uncultivated. He read incessantly and exclusively Plutarch and Quintus Curtius; there he sought the food of great souls, the history of the heroes of antiquity. He was capricious, indocile, and a grumbler. It was said of him, that he

liked not either to command or to obey; and this was true. He obeyed under General Bonaparte, but not without murmuring; he sometimes commanded, but in the name of another, under General Jourdan, for example; assuming the command by a sort of inspiration amidst the battle, exercising it like a superior captain, and, after the victory, resuming his character of lieutenant, which he preferred to any other. Kléber was licentious in his manners and language, but upright, disinterested, as men were in those days, for the conquest of the world had not yet corrupted their dispositions.

"Desaix was the reverse in almost every respect. Simple, bashful, nay, somewhat awkward, his face hid by a profusion of hair, he had not the look of a soldier. But, heroic in action, kind to the soldiers, modest with his comrades, generous to the vanquished, he was adored by the army and by the people conquered by our arms. His solid and eminently cultivated mind, his intelligence in war, his application to his duties, and his disinterestedness, made him an accomplished model of all the military virtues; and, while Kléber, indocile, refractory, could not endure any superior authority, Desaix was obedient, as though he had not known how to command."

And in what follows, of his portraits of statesmen, or men so called.

TALLEYRAND AND FOUCHÉ.

"M. de Talleyrand descended from a family of the noblest lineage, destined by his birth for the army, doomed to the priesthood by an accident, which deprived him of the use of one foot, having no liking for this imposed profession, successively bishop, courtier, revolutionist, and emigrant, then afterwards minister for foreign affairs under the Directory, M. de Talleyrand had retained something of all these different states; there was to be found in him a touch of the bishop, of the man of quality, and of the revolutionist. Having no firmly fixed opinion, but only a natural moderation which was opposed to every species of exaggeration; capable of entering at once into the feelings of those whom he wished to please, either from liking or from interest; speaking a unique language peculiar to that society which had Voltaire for instructor; full of smart, poignant repartees, which rendered him as formidable as he was attractive; by turns caressing or disdainful, demonstrative or impenetrable; careless, dignified, lame without loss of gracefulness,—in short, one of the most extraordinary personages, and such a one as a revolution alone can produce,—he was the most seducing of negotiators, but at the same time incapable of directing, as head, the affairs of a great state; for every leader should possess a resolute will, settled views, and application, and he had none of these. His will was confined to pleasing, his views consisted in the opinions of the moment, his application was next to nothing. In a word, he was an accomplished ambassador, but not a directing minister; be it understood, however, that this expression is to be taken in its most elevated acceptance. For the rest, he held no other post under the consular government. The first consul, who allowed no person the right to give an opinion on the affairs of war and of diplomacy, merely employed him to negotiate with the foreign ministers, on basis previously prescribed, and this M. de Talleyrand did with an art that will never be surpassed. He possessed, however, a moral merit,

that of being fond of peace under a master who was fond of war, and of showing that he was so. Endowed with exquisite taste, uniting with it unerring tact, and even a useful indolence, he was able to render real services, by simply opposing to the first consul's exuberance of language, pen, and action, his sobriety, his perfect moderation, and his very propensity to do nothing. But he made little impression on that imperious master, from whom he extorted no respect either by genius or by conviction. Thus he had no more empire than M. Fouché, nay, even less, though quite as much employed, and more agreeable. Then again, M. de Talleyrand said just the contrary to what M. Fouché said. Attached to the ancient régime, minus the persons and the ridiculous prejudices of other times, he recommended the reestablishment of the monarchy as soon as possible, or an equivalent for it, by availing of the glory of the first consul in lieu of blood-royal, adding that, if we wished to have a speedy and a durable peace with Europe, we ought to make haste to resemble other states. And, while his colleague, Fouché, in the name of the revolution advised that we should not go too fast, M. de Talleyrand, in the name of Europe, advised that we should not go so slow. The first consul prized the plain good sense of M. Fouché, relished the graces of M. de Talleyrand, but absolutely believed neither the one nor the other on any subject."

Our last extract is a picture very happily framed.

NAPOLEON CROSSING THE ALPS.

"Artists have delineated him crossing the Alpine heights mounted on a fiery steed. The plain truth is, that he ascended the St. Bernard in that gray surtout which he usually wore, upon a mule, led by a guide belonging to the country, evincing, even in the difficult passes, the abstraction of a mind occupied elsewhere, conversing with the officers scattered on the road, and then, at intervals, questioning the guide who attended him, making him relate the particulars of his life, his pleasures, his pains, like an idle traveller, who has nothing better to do. This guide, who was quite young, gave him a simple recital of the details of his obscure existence, and especially the vexation he felt, because, for want of a little money, he could not marry one of the girls of his valley. The first consul, sometimes listening, sometimes questioning the passengers with whom the mountain was covered, arrived at the Hospice, where the worthy monks gave him a warm reception. No sooner had he alighted from his mule, than he wrote a note which he handed to his guide, desiring him to be sure and deliver it to the quarter-master of the army, who had been left on the other side of the St. Bernard. In the evening, the young man, on returning to St. Pierre, learned with surprise what powerful traveller it was whom he had guided in the morning, and that General Bonaparte had ordered that a house and a piece of ground should be given to him immediately, and that he should be supplied, in short, with the means requisite for marrying and for realizing all the dreams of his modest ambition. This mountaineer died not long since, in his own country, the owner of land given to him by the ruler of the world. This singular act of beneficence, at a moment when his mind was engaged by such mighty interests, is worthy of attention. If there were nothing in it but a mere conqueror's caprice, dispensing at random good or evil, alter-

nately overthrowing empires or rearing a cottage, it may be useful to record such caprices, if only to tempt the masters of the earth to imitation; but such an act reveals something more. The human soul, in those moments when it is filled with ardent desires, is disposed to kindness; it does good by way of meriting that which it is soliciting of Providence."

M. Thiers is careful to avoid, as far as may be, the bandying of national reproaches. He wisely thinks that in matters of national blame, institutions should have the largest share; and so winds his way with the least possible offence, and with the wary eye of a practised statesman, through the intricacies, incapacities, errors, and oversights of cabinets. We like, in this respect, the tone of his history.

But should none, save his own countrymen, in matters of individual glory, have liberal largess of his praise? He strains his sight at Marengo, why should he narrow it at Copenhagen? He characterizes Mr. Pitt as "obstinate but not enlightened;" in another place, as with more passion than understanding; in a third, as "an able and powerful leader but with little enlightened views" (the translator is not careful here) "as a statesman;" in a fourth, as destroyed by Napoleon's successes; and, finally, as "*The greatest statesman England ever had!*" In other words, England never had a statesman of enlightened views. We observe in the same page with the latter notable assertion, a very large *If* and a very doubtful inference. "If he succeeded," says M. Thiers, in an argument as to Bonaparte's relations with England, "if he succeeded in crossing the English channel with an invading army, *England was lost.*"

There is a happy and pleasantly written notice in the second volume, of the Royalists during the Consulate, their childish plots, their foolish gossip, and Josephine's silly encouragement to both. But we must part with M. Thiers for the present.

What his tone is likely to be in his later and most important volumes, we can hardly anticipate from these. But let us hope he will have time to remember, in the midst of the imperial glories, that chiefly his hero fell because of his propensity to forget, till it was too late, that such things as a people existed. He forgot it in the country he governed, and he forgot it in the countries he invaded. The great events of Napoleon's career will have found a worthy historian, if this moral is not wholly lost sight of by a mind so admirably qualified to give to it its proper weight and range.

There is one principle, theory, or dogma, implied rather than distinctly adopted by M. Thiers, against which we would most earnestly warn him in the progress of those future volumes. He seems to think that Napoleon carried out, upon the whole, the intention and purpose of the French Revolution; and that this, suspended but a time by the return of the elder Bourbons, has been resumed by the revolution of '30. Surely there is a confusion of ideas here. The very basis of the revolution of '30 was the reverse of an aggressive policy: it was the right of an independent nation (a right we hold to be indisputable) to change its government, when, how, and as often as it pleases. Mr. Pitt denied that right in 1800, but the Duke of Wellington bowed to it in 1830. Omit the aggressive policy of Napoleon—who, having based his power on victory, could only by victory sustain it—and we will grant that the later revolution was indeed but the supplement of the first. The great

soldier, on receiving the dignity of first consul, made it his duty, as doubtless it was, to repress within bounds the spirit of revolution, still "extravagant and erring;" and to endeavor to consolidate and establish. But he made grievous error in the process. The whole principle of his government was forced and unnatural, or the reimposed yoke of the Bourbons would never have been borne. Society, cramped and crippled by his despotisms, submitted to the relief of even that miserable change; and when, in 1830, it broke loose again, the principle it asserted was not Napoleon's tyranny, but the resistance to every form of tyranny established by the first revolution. It was the great doctrine that no government can be secure which does not provide for giving effect to the general sense of the community it governs: a principle which still waits its complete development in France. For we sincerely believe that if such provisions for representative liberty were made effective there, we should hear no more of the glories of this most mean, false, and futile "aggressive policy." The electoral representation of France is a representation by means of Paris newspapers, as it stands at present. And so it will remain till enlightened French statesmen cease to copy Napoleon's grand mistake, and leave the people out of all their calculations.

Mr. Campbell's translation is very good, but with occasional slips here and there: and is published at a very moderate price, on the plan of the cheap and spirited series of books called the *Foreign Library*.

From the Spectator.

TRENCH'S TRAVELS IN FRANCE AND SPAIN.

THE Reverend Francis Trench, with his wife, his man, and a light open pony-carriage, started for an autumnal tour in the south of France; but circumstances extended it to Spain in point of region, and nearly a year in point of time. As regards mere novelty of country, there is not much in Mr. Trench's early route—Dieppe, Rouen, Paris, the valleys of the Loire, the Garonne, and the Adour, with the Pyrenean watering-places, and the Spanish frontier-towns. The latter part, leading through Auvergne, has more of freshness; for it has been rarely visited by the traveller, and not at all frequented by the tourist. The character of the book, however, is not dependent upon high-roads, but partly arises from the author, and partly from his ponies.

Mr. Trench himself is an Anglican clergyman, we should think with Evangelical views; and his tour was made subordinate to Christian objects. When he arrived at any place where any English were residing, he immediately issued cards for divine service on the Sunday, in his apartments; and this invitation was invariably responded to, and not unfrequently by French Protestants. An object of nearly equal interest was to search out the Reformed churches, and to attend their service: by both which means he was introduced into more society and of a much better class than common travellers. The state of the Romish religion in France was another object: this led him to frequent the Catholic churches, with a view to examine their practice and the views they inculcated, (which he found heathenish beyond his expectations,) and occasionally brought him into courteous controversy with some of their

divines. This pursuit gives novelty of subject and earnestness of character to great part of the work: nor is Mr. Trench devoid of qualifications to travel with advantage. He has seen the Alps, Italy, Vesuvius, and Etna; so that he brings knowledge of other countries to bear upon the Pyrenees and the landscapes of France and Spain. He has also the readiness and willingness to converse with strangers, that generally distinguishes the practitioners of the liberal professions—at least the general body, for barristers, like captains, and dons in the church, stand more upon their dignity, such as it is. Hence he profited from casual encounters with the people, especially as his tracts were often a mode of introduction, either in community or question.

But the pet ponies must not be defrauded of their due merit; for a good deal of the freshness of the book must be attributed to them. They enabled Mr. and Mrs. Trench to do without the diligence, to quit the high-road for the by-ways, to visit places inaccessible to the usual run of travellers, and even to reach towns where neither the books of the hostel nor the memory of man recorded the appearance of an Englishman. The necessity of looking after the stable of the little creatures, and the excitement their appearance produced, also give a feature to the book, from the sensation they produced among that easily excited people.

THE PONIES IN FRANCE.

A stall is an equine luxury almost unknown at French inns: at least I have not yet seen one. This renders great care under any circumstances needful for those who take their own horses about the country. Still more did my little ponies require protection against the monstrous animals often met with at the inn-stables, from whom one kick would have been utter destruction. In vain did landlords, landladies, ostlers, and lookers-on innumerable, say to me, "Soyez tranquille, Monsieur," or "Pas de danger, Monsieur," when I thought a position in any way precarious; and I must say that almost invariably efforts were good humoredly made to meet my wishes and remove all apprehensions. In saying this, I do not speak of this watchfulness as involving any trouble which proved disagreeable to me. On the contrary, I often found that my visits to the stable brought me into amusing and instructive communication with travellers or natives of each separate locality; and besides this, as I have said before, few Englishmen will look upon their horse, especially on a long journey, otherwise than as a friend. I must say also that the ostlers were very gentle towards the ponies; and indeed they were so small and harmless, notwithstanding their unwearied spirit and endurance, that they were quite treated as pets by all who came near them. Not only did gentlemen pay them visits, but mammas came and put their children on their backs: one lady who was an invalid had the little gray absolutely led into her room; and another handsome and sprightly young landlady was so charmed with them on our arrival at her door, that she called out, patting them, and summoning the household to see them, "les amours!—les amours!"

On one occasion Mr. Trench followed a few hours in the rear of Franconi's celebrated troop; and the little chaise with the little ponies connected in public opinion the Anglican divine with

the equestrians ahead, and induced the belief along the road that he was "le directeur de la compagnie." On arriving at Périgueux, he was addressed "Francconi n'est ce pas;" whilst in Spain he had to exhibit his equipage.

THE PONIES AT PAMPELUNA.

My pony-carriage also made, if not an equal, at all events a most unexpected sensation. It was visited by several parties, including ladies and gentlemen, who heard of its being in the inn-yard; and I had four or five special requests addressed to me, that I would drive it out in the town and let the inhabitants see it. Accordingly, one evening I gratified their desire; and, as it passed, people called one another out of their houses, and hurried to the side of the public walks, forming successive lines, to see my unpretending little equipage. Here, as in many other places, I have had some interesting conversation, which commenced by remarks or inquiries relative to the carriage or ponies. In the *salon* of the hotel, a party of four gentlemen referred to me a little discussion which they had had as to the price of such a vehicle. I told them that I had given fifty pounds for it; which they seemed to think, as many others—for the inquiry was a very common one—a very moderate price."

The great merit of "the ponies," however, was in carrying their owner into the country, enabling him to choose his own manner and time of seeing things, and allowing him leisure to examine a prospect or a district, to stop in a town as long as its features or its vicinity offered any attraction, or there was any social or spiritual call in the place: and we think with Mr. Trench, that it was lucky he disregarded the solemn warnings of his friends touching the troubles his "turn-out" would bring upon him.

Besides the advantage of a distinct pursuit, with the means of penetrating into the country and examining it at leisure, the *Diary of Travels in France and Spain* exhibits judgment in the treatment of subjects, and an attractive style. The more common themes—as Paris, the spas, and so forth—are passed over, except so far as they furnish something peculiar to the writer's pursuits; and he runs nothing down in description, unless perhaps occasionally his religious topics. His diction is terse, and has that rapid, pointed, and easy manner, which is not so much scholarly as gentlemanly—smacking of public schools and university training. Of the matter of his miscellaneous passages the following quotations may be taken as fair specimens.

WAGES OF LABOR IN THE SOUTH.

Stopping for a quarter of an hour to-day at a small way-side inn, an intelligent and obliging hostess gave me freely such communication as I sought regarding the condition of the people in the neighborhood. She said, that when laborers were hired, it was always the custom to feed them; and that, in addition, from twelve to fifteen sous were given. She sometimes employed them herself; when they had for breakfast bread or chestnuts; for dinner, soup and such things as omelette, meat, rye-cakes; for supper, the same as at dinner. Generally also wine; but this year it is so extremely dear, that, she said, this was out of the question. Lowering her voice, she made an admission, such as that which the teetallers often enforce, that when wine was given,

the appetite was not so strong; and in a shrewd, confidential manner, she explained that on this principle it was quite as well for her to give some wine.

FRENCH CULTIVATION: COGNAC: ANGOULEME.

Occasionally we passed large tracts presenting the richest and most cultivated appearance. They were not enclosed, but occupied by all kinds of crops dispersed in small parallelograms. Every inch of soil was tilled. The lines between each division were as straight and fine as possible. Not a weed was to be seen. The stones were all carefully picked out and laid in regular heaps. At one part the land sloped towards us from a considerable distance, and I could not help thinking of it as like one vast and flourishing "allotment" garden. Those who take an interest in the agricultural laborers of our own country will at once recognize the term and comparison.

SPANISH FIRE.

"The kitchen-fire in Spain is usually made in the following manner. A square portion of the floor is allotted as hearth. On this are laid logs of wood, six or seven feet in length, with their ends together, like the sticks of a gipsy fire. As they are consumed, these logs are pushed forward till burnt out. Above is the chimney, formed of boarding in the shape of an immense funnel, with the broad part downwards, and reaching within about seven feet of the fire. The funnel conducts to a narrower orifice above. Meat is roasted, and all the cookery is carried on by the mere use of the burning wood on this primitive hearth. The fire is usually of enormous size; and at the inn of Roncesvalles a bench occupied two sides, on which I was not sorry to take an half-hour's seat after my supper, the elevation of the spot having made the air chilly."

ELECTRIC CLOCKS.—The following extract from a letter from Mr. Finlaison, of Loughton Hall, appears in the *Polytechnic Review*:—"Mr. Brain has succeeded to admiration in working electric clocks by the currents of the earth. On the 28th of August he set up a small clock in my drawing-room, the pendulum of which is in the hall, and both instruments in a voltaic circuit, as follows:—On the N. E. side of my house two zinc plates, a foot square, are sunk in a hole, and suspended to a wire: this is passed through the house, to the pendulum first, and then to the clock. On the S. E. side of the house, at a distance of about forty yards, a hole was dug four feet deep, and two sacks of common coke buried in it: among the coke another wire was secured, and passed in at the drawing-room window, and joined to the former wire at the clock. The ball of the pendulum weighs nine pounds, but it was moved energetically, and has ever since continued to do so with the self-same energy. The time is to perfection, and the cost of the motive power was only 7s. 6d. There are but three little wheels to the clock, and neither weights nor spring; so there is nothing to be wound up."

CALMNESS IN COMMOTION.—Robert Hall said of John Wesley, "The most extraordinary thing about him was, that while he set all in motion, he was himself perfectly calm and phlegmatic: he was the quiescence of turbulence."

Oracles from the Poets: a fanciful Diversion for the Drawing Room. By CAROLINE GILMAN. New York and London, 1844. Wiley and Putnam.

THE idea of this volume is excellent, and the execution unexceptionable. It has often surprised us, when listening to the stupid fortune-telling cards introduced to break the tedium of a dull party in a drawing-room where dancing is not patronized, that some ingenious personage should not have taken pity upon the grown-up children who thus try to think themselves amused, and constructed a series of questions and replies that should at least possess the attractions of common sense, if not of wit and poetry. We have at last received from America such an attempt, and it is entirely successful.

Mrs. Gilman has supplied to each of the favorite questions a collection of replies, extracted from the British and American poets, chosen, for the most part, with an eye to their intrinsic beauty as well as their aptitude to the query; and from their number, and the variety of sources from which these replies are taken, the volume must have been the labor of many months.

In this volume fourteen questions are answered, but another is promised with a completion of the current catechism. An instance or two will exhibit the happy choice of the compiler.

To the question, "What is your character?" put to a gentleman, these are some of the answers:—

You are one
Who can play off your smiles and courtesies
To every lady, of her lap-dog tired,
Who wants a plaything. SOUTHEY.

You act upon the prudent plan,
Say little and hear all you can—
Safe policy, but hateful. COWPER.

A right tender heart,
Melting and easy, yielding to impression,
And catching the soft flame from each new
beauty. ROWE.

And there are sixty answers equally apt with these to that single question.

The query, "What gratifies your taste or affections?" leads to some very singular replies. To wit:—

Give all things else their honor due,
But gooseberry pie is best. SOUTHEY.

Oh! sweeter than the marriage feast,
'Tis sweeter far to thee,
To walk together to the kirk
With a goodly company. COLERIDGE.

A wheel-footed studying-chair,
Contrived both for toil and repose,
Wide-elbow'd and wadded with care,
In which you both scribble and doze.
COWPER.

Lighted halls,
Cramm'd full of fools and fiddles.
R. G. SANDS.

The amusement and real interest such a rational fortune-telling as this must excite in the family circle will be at once apparent.

In her preface, Mrs. Gilman states some curious results of her researches into the works of the poets. In Shakespeare she looked in vain for places of residence. In Wordsworth scarcely a flower or musical sound is described. Shelley, London, and Howitt, are eminently the poets of

flowers; while Darwin, with a whole *Botanic Garden* before him, and Mason, in his *English Garden*, scarcely supplied a single fitting extract.

Milton and Coleridge were found very unprolific for her purposes, on account of the abstract and lofty flow of their diction. "Keats and Shelley are the poets of the heavens." "Byron, with few exceptions, does not describe a flower, a musical sound, or place of residence."

The volume is exquisitely printed and delicately bound for drawing-room use; and perhaps it is needless to add a recommendation to the description we have given of it, and which will be sufficient of itself to excite the reader's interest, and insure its introduction into the families of our friends. It is the very book for a present.—*Critic.*

TALENTED WOMEN.

WOMEN gifted like Zoe often present instances of aberration from the standard of female rectitude. It is not that high talents are in their own nature inimical to the delicate and refined virtues, but they require in proportion a stronger and wiser guidance than they often get. The motives that influence the generality of women do not touch women of high powers; they do not feel the obligations of those small moralities, the fear of "being singular," of rendering themselves the subject of "remark," which wholesomely qualify the love of admiration and display, in the generality of female breasts. They have more energy of character than is absorbed by the routine of duties women are generally called upon to perform, and they have no channel in which their superfluous activity can be expended. Women seldom have their powers equalized and balanced by a thorough education, so it is not wonderful that one gifted with more strongly marked strength of character than the generality should have somewhat of the eccentric and irregular in her actions. Her strength resembles the undirected activity of a child—much promised, and nothing accomplished with it. Beside women cannot, like men, correct their false or crude notions by intercourse with the actual world; from their natural position they are prevented taking a broad view of things as they really exist. When a woman steps beyond her own domestic circle, into whatever scene she goes she is the subject of a social fiction; she is treated as a visitor, not as an inhabitant; therefore what a woman calls "a knowledge of the world" is only a fresh source of bewilderment, which, besides being in the highest degree undesirable, is confined to a coarse exaggeration of scenes, which undoubtedly do take place, but which lose their truth by being detached from the course of natural circumstances under which they occur. Women of the class we are describing have often a morbid curiosity for this kind of enlightenment; but it leads them no nearer to their object, viz. something to fill the void in their hearts and intellects.—*From Zoe, a novel.*

VULGAR ELOQUENCE.—An example of popular eloquence, calculated to produce a great effect, however familiar in itself, occurred in a preacher among the Methodists having said, in order to exhibit the contrast between time and eternity—"Suppose a departed sinner had been ten thousand years in punishment, and that, upon hearing a bell toll, he should inquire, 'What is that o'clock?'—the answer could only be—Eternity!"

From the Examiner.

Revelations of Spain in 1845. By an English Resident. Two vols. Colburn.

THIS is a very clever book, of which the best portions are the non-political. In force and liveliness of manner, we have had nothing that so much reminds us of the late Mr. Inglis' *Rambles in the Footsteps of Don Quixote*, as the purely descriptive parts of *Revelations of Spain*.

The book is clearly the result of considerable experience of the things described; and the writer appears to be still resident in Spain. This may account for his speaking with a less startled abhorrence than the casual traveller would display, of the political atrocities and disasters of that unhappy country. But there seems to us also, in that direction of his inquiries, (excepting where he exposes the hollowness of the Carlist pretensions and the false sympathy about them in England,) a certain want of sincerity or of candor. He thinks Espartero an honest and respectable man; and on every occasion sneers at him, or makes more serious objections. He thinks Narvaez a scoundrel; and omits no opportunity of assuring us that his rule has been favorable to English interests. The plain speaking is either too little or too much.

Of the young queen his opinion is most unfavorable. Her defects, moral and physical, are exposed with unrelenting bitterness; and, there is too much reason to believe, with absolute truth. She seems a miniature Ferdinand; but fonder of *bonbons* than of petticoats or embroidery. He at the same time tells us that her life is far from secure; that scrofula and dropsy have marked their victim; and that the best hopes of Spain rest with her charming and graceful little sister, the Infanta Louisa.

This is the pretty young lady whom the far-seeing Louis Philippe marked out for his Duc d'Aumale; and it is clear that the author, who reveals a French propensity among his other revelations, would be the last to object to that union; irreconcilable with any durable pacification of parties, or a safe constitutional settlement, as it would infallibly prove. This is not an instance of long-sightedness. One may be too near as well as too far off, where ambassador's offices are in the way more especially, to see with much exactness.

Apart from politics the author often writes delightfully. That his view is not very deep, we think we can perceive in his insufficient chapters on the clergy. But where manners and customs come in question, the *venta* or *posada*, dances and bull-fights, rogues and beggars, quacks and mountebanks, robbers and innkeepers, or the external aspects of life and scenery, nothing can be better, nothing more animated, more fascinating than the *Revelations*. We read in them of this strange country, as of the picturesque, semi-barbarous times of our own, five hundred years ago. The book is full of life and color. The observation is quick, the drawing easy, the painting harmonious and fresh.

We could have wished to dwell further on these portions of the book. But even our extracts (rich as the volumes are in quotable matter) must be extremely brief.

A MADRID MOB.

"The Porte St. Denis, and the Boulevard St.

Antoine, Guildhall and Kennington Common, are pale by the side of these brown and impassioned faces, these black and wiry locks like the snakes of Tisiphone, these moustaches of Barbary darkness, these ever-moving lines and ropes of facial muscle, strangely set off by the peaked black velvet hat which is universally worn; and the cloak, which, even in his rags, the Manolo wears with the grace of a Roman senator, and the dignity (for he thinks himself no less) of a Castilian *hidalgo*."

A SPANISH REVOLUTION.

"It requires little to decide the Peninsular reformer to rush to the public square and make a new revolution. At times, he is so quick about it that *he forgets to put on his shoes*; a fact surprising to our northern natures, but familiar to all who have witnessed an alboroto in Madrid, Barcelona, or Seville. A dozen *vivas*, the beat of a drum, three steps in advance—it is done!"

THE QUEEN AND HER BONBONS.

"The most striking characteristic of the youthful Majesty of Spain is her relish and constant use of *bonbons* and sweetmeats. Her papers of comfits strew the palace, her bags of sugar-plums visit the council-chamber, her *dulces* line the throne. * * * The degrees of ministerial favor may be estimated by the number of presents of confectionery, and the minister of the interior is *first fiddle* by right of four bags of sugar-plums, till the minister of grace and justice produces five sticks of barley-sugar. When she despatches business with her ministers, (which she does twice a week,) she despatches a prodigious quantity of sweets at the same time; and the confaction of decrees, and discussion of dainties, proceed *pari passu*."

NARVAEZ.

"General Don Ramon Narvaez, the successful hero of the day, looks precisely the daring, energetic, obstinate and iron-nerved soldier of fortune which he is. In habits, manners, and appearance, he is of the purest military breed; blunt and off-handed in his address, overbearing in disposition, slow to take advice, impolitic, violent, and very determined in his proceedings. His dark moustache has the rough campaigner's cut, and his pale, stern, and somewhat cruel countenance, betokens his unbending character. * * * He is sumptuous and showy in his habits, but not luxurious in his tastes, and is always ready in his food and drink to rough it like a campaigner. * * * * Those who remember him an out-cast two years back, expelled from Portugal upon the requisition of Espartero, a wanderer through the provinces of France, with broken boots that let in the wet, a greasy hat and a thin coat, which ill-protected him from the inclemencies of a severe winter, will appreciate fully the fairy-like change in his circumstances."

RECIPE FOR A PRONUNCIAMIENTO.

"Buy over three or four officers and a dozen sergeants of a regiment. Give twenty dollars to each officer, and a four dollar piece to each of the sergeants; give a *peseta* to a blind news-hawker, and a well-invented tale of political rascality of any kind; distribute a score of rusty guns and pistols among as many *mauvais sujets*; appoint a particular hour for an explosion, and the thing is almost as infallibly accomplished as the re-

cent blowing up of the Shakspeare Cliff at Dover."

And yet the writer is indisposed to admit that the early pronunciamientos against Espartero were "bought over" with the gold of France.

ABSURDITIES OF RESIDENT ENGLISH.

"I find 'John Duncan Shaw' metamorphosed into 'Don Juan Duncano Schau—'Salter,' into 'Saltero,' and plain 'Paul Cross,' into 'Don Pablo Mariano Crosa.' But the oddest of all these metamorphoses is that effected in a few years' time in a person who, for political purposes, was desirous to appear as Spanish as possible; and he who went forth masquerading as 'Don Jacinto Rosel,' had some time before been little 'Jack Russell.'"

THE GREATEST LORD IN ENGLAND.

"An amusing sensation was created by the news of Espartero's having been invited to a public banquet by the Lord Mayor of London. Most Spaniards translated the word *Mayor* literally, according to its meaning in Castilian, 'greater,' and took it that the ex-regent had been invited to dine by the *greatest* lord in England."

SPANISH EPITHETS.

"When the beggar goes forth to make his rounds, they say: *Vase por diosear*, 'He goes to God's-sake-ity,' or to beg alms for the sake of God. No other language has an equivalent for this forcible phrase, which might be paralleled in a multitude of instances. When the beggar proceeds from door to door, he is *menudeando*, 'little-and-little-afying,' or collecting his fragments and coppers in a bag; and when he comes home, the neighbors say to each other, (for Spanish women seem to have nothing to do but to gaze out of the window :) *Ahora vase cucharetear*, 'There he goes to spoonify,' (meaning that he is about to convert his scraps into an *olla podrida*.")

Mr. Bulwer is often mentioned in the course of the *Revelations* with admiration and praise.

QUEEN CAROLINE'S WILLIAM AUSTIN.

A COMMISSION has been held before Mr. Commissioner Winslow and a special jury of the country, at the Sheriffs' Court, Red Lion square, to inquire into the state of mind of "William Austin, late of the city of Milan, but now residing at Blackland House, Chelsea, gentleman."—The commission was taken out at the instance of Sir Thomas Wilde and Dr. Lushington, guardians or trustees of the unfortunate gentleman.

Mr. Walpole said, the subject of this inquiry was Mr. William Austin, a gentleman about forty years of age, but of limited means, his property consisting of about 4,000*l.* invested in the funds. He had been brought recently from Milan, where he was residing when first attacked with this infirmity; and it was thought advisable to place him in one of the asylums in that city. He was first afflicted with loss of mind as far back as the year 1830. Mr. Austin in 1841 was an inmate of the Hospice de Sante at Milan. The unfortunate gentleman became completely imbecile, and his imbecility was so absolute as to amount almost to idiocy. The guardians thought it advisable that he should be brought to England, and in February last he left Milan in the care of a keeper, and on

the 6th of the present month arrived in England. After having been seen by Dr. Chowne and Mr. Moore, he was removed to Dr. Sutherland's establishment, Blackland House.

Louis Balbi said he was a keeper at the Hospice de Sante at Milan. Under his care was a person named Austin, who was an inmate of the asylum about three years. He would eat, drink, and sleep, but never spoke. During the three years he never spoke once. When spoken to he never answered, and was incapable of doing anything. He was very much attached to a piece of stick, which never leaves his possession night or day. He never gave any reason for his attachment to the stick. Witness accompanied him from Milan to London.

After further evidence Mr. Austin was brought into Court. In his hand he held a small piece of grape-vine stick, which he kept twirling round, totally unconscious of all that was passing. The commissioner spoke to him three or four times, but he took not the slightest notice. He, however, on the bidding of the keeper, stood or sat down, but beyond that all with him was blank. On the commissioner giving the order for him to withdraw, he followed the keeper. It was a most painful sight.

The jury immediately returned a verdict "that William Austin was of unsound mind, and incapable of managing his affairs, and had been so since the 15th of September, 1841."

He was adopted when a child, by the late Queen Caroline, to whom she bequeathed by her will a portion of her property.

The Snow-Drop: A Gift for a friend: Edited by C. W. EVEREST.

THIS is a modest little volume of original prose and verse, just issued by J. S. Redfield, price 37*1*/₂ cents. It is of the same class with "The Moss-Rose" and "The Hare Bell," by the same editor, which the public have received with decided favor. Among the contributors are Mrs. Sigourney, W. H. Burleigh, Aug. Snodgrass, etc. We copy the opening poem:

THE SNOW-DROP.—BY MRS. L. H. SIGOURNEY.

When infant Spring, with a tremulous ray,
Doth tread in the steps of the Winter gray,
And the prisoned streams on the frosted plains,
Are breaking the links of their icy chains,
Ere yet the Violet hath dared to show
Its timid brow, through the melting snow,
While the Dahlias and Tulips, on couches deep,
In their bulbous night-caps are fast asleep,
Like Beauties fatigued at the midnight rout,
Who shut the sun with their curtains out,—
At the earliest call of the blue-bird sweet,
I put my head through the mist and sleet,—
And haste to bring with my simple cheer
The first glad wish of the new-born year.
But now, from Autumn, a boon I bear,—
Of varied tint, and a perfume rare;
Taste hath trodden the field and bower
The bird to win, and to cull the flower,
And to gather them close in a charmed ring,
And to tie them fast with a silken string;
Friendship doth offer the gift to thee,
Pure and warm may its gerdon be.

New York Tribune.

From a review of Roberts' *Life of Monmouth*, in *The Critic*.

THE BUTCHER-JUDGE.

THE butcheries of the soldier sunk into insignificance compared with those of the lawyer. To the *Bloody Assizes* under the infamous Jeffreys, Mr. Roberts devotes one of the most interesting of his chapters.

The judge is described as "perpetually either drunk or in a rage." Lord Delamere thus pictures him.

He was mighty witty upon the prisoners at the bar; he was very full of his jokes upon people that came to give evidence, not suffering them to declare what they had to say in their own way and method, but would interrupt them, because they behaved themselves with more gravity than he; and, in truth, the people were strangely perplexed when they were to give in their evidence. But I do not insist upon this, nor upon the late hours he kept up and down our city (Chester;) it's said he was every night drinking till two o'clock, or beyond that time, and that he went to his chamber drunk; but this I have only by common fame, for I was not in his company. I bless God I am not a man of his principles or behavior; but in the mornings he appeared with the symptoms of a man that over night had taken a large cup.

At Dorchester he resorted to the trick of tempting the prisoners, by hopes of mercy, to plead guilty.

The thirty persons against whom a true bill had been found, disregarding the judge's threatening, "that in case any did put themselves on trial, and the country found them guilty, they should have but a little time to live," put themselves on their trials. The judge had at the same time insinuated "that it was better to plead guilty, if they expected any favor."

The plan adopted to shorten the business at Dorchester, and to procure a confession, without which not a tenth part could be legally proved guilty, was this:—Two officers were sent into the gaol to call over and take the names of the prisoners. They bore with them the sister promises of pardon and execution. If the prisoners confessed, they were told they might expect mercy; otherwise not. And as many were induced to accept the proffered mercy, these officers were in a condition to appear as witnesses of their confession, (as the law was then administered,) in the case of their retracting.

The first thirty, mistrusting the cruel judge, put themselves upon their trial, and pleaded *not guilty*. This was on Saturday. The same evening Jeffreys signed a warrant to hang thirteen on the Monday following; which was punctually performed. The rest followed very soon afterwards, except one Saunders, who was acquitted for want of evidence. The pleading *guilty* by the other prisoners put an end to further trial.

The judge performed his office in a manner that we hope never to see rivalled or imitated. What a sight did the court-house of Dorchester present, when two hundred and ninety-two persons received sentence of death at one and the same time.

The brutal bearing of this monster is exhibited in the following anecdotes:—

Mr. Smith, the constable of Chardstock, who had been compelled by a party of the duke's men to surrender some money belonging to the militia, was hanged upon the same evidence as Mr.

Bragge; and, by particular directions from the judge, suffered the first of the party. This prisoner had informed the court that little credit ought to be given to the evidence. Jeffreys thundered at him, saying, "Thou villain! methinks I see thee already with a halter about thy neck—thou impudent rebel! to challenge these evidences that are for the king." Mr. John Marder had friends to speak of his readiness to forward the messengers from Lyme who gave information of the landing. One of them, an injudicious friend, spoke to his being "a good Protestant." "Oh, then," cried Jeffreys, "I'll hold a wager with you he is a Presbyterian: I can smell them forty miles." Alderman Holliday, the father of Richard Holliday, appeared on behalf of his son, claiming the benefit of the proclamation, as he had surrendered within four days, and offering to be bound for his future good behavior. The judge told him he knew many aldermen who were villains, and that he hoped to beat some fur out of their gowns before he had done with them. When John Bennett, of Lyme, was placed at the bar, some person observed that he received alms of the parish; to which the judge, in a facetious manner, replied, "Do not trouble yourselves; I will ease the parish of that burden."

It is melancholy to reflect that these cruelties were stimulated and applauded by the High Church clergy, who were delighted thus to exterminate, as they hoped, the hated Dissenters. Here is an instance:—

Wiseman, an apprentice to a barber at Weymouth, was only fourteen years of age. The people one morning perceived a copy of the Declaration stuck up; not being able to read it, they bethought themselves of this youth, who had the gift, now so common, but then so rare. The whipping commenced at Dorchester, where the gaoler, pitying the boy's early years, performed his office with as little severity as he could. A clergyman named Blanchard informed the merciful gaoler "that he would do his business for him with the lord chief justice for shamming his sentence, in not whipping the boy half enough." The man, exasperated at this interference, said, "You talk of the cruelties of the Popish priests, but commend me to a Church of England priest for cruelty; they are like the country justices, who won't believe a man is burnt in the hand unless they can see a hole through it." It is uncertain whether this clergyman really did inform; some one sent to Jeffreys, who had the poor boy whipped again the following morning to such a degree that his life was despaired of.

At Exeter thirteen were executed. Thence, still thirsting for human blood, the judge proceeded to Taunton, where no less than 526 persons were waiting their trials. Of these, no less than one hundred and forty-four were executed!!

The reader who has felt interested in the presentation of the colors to the Duke of Monmouth by the Taunton maids, may be desirous of learning how they fared at such a time as this, when the air was tainted with the smell of the quarters of the leaders of the recent pageant, and of their own relatives. One of the Miss Blakes, the schoolmistress, was committed to Dorchester gaol, where she died of the small-pox. One of the young maids (some of whom were only from eight to ten years of age) surrendered herself in court, begging mercy from the judge, who, when she

was produced before him, looked on her with a very fierce countenance, and raving, commanded the gaoler to take her. This struck such terror into the poor girl, that pulling her hood over her face, she fell a-weeping, and the gaoler removing her immediately out of the court, she died, not many hours after, through fear.

At Wells, *ninety-seven* were sent to the gibbet. And this is the scene the monster left behind him.

Jeffreys' whole progress might be traced by the carnage he left behind him. Every tower and steeple were set round with the heads of traitors. Wherever a road divided a gibbet served for an index; and there was scarcely a hamlet, however obscure, to which one limb at least was not sent, that those who survived might never lose sight of their departed friends, nor the remembrance of their crime or punishments. The following description of the beautiful west country disfigured by Jeffreys is very striking: "He made all the west an *Aceldama*; some places quite depopulated, and nothing to be seen in 'em but forsaken walls, unlucky gibbets, and ghostly carcases. The trees were loaden almost as thick with quarters as leaves; the houses and steeples covered as close with heads as at other times frequently in that country with crows or ravens. Nothing could be liker hell than all those parts; nothing so like the devil as he. Cauldrons hissing, carcases boiling, pitch and tar sparkling and glowing, blood and limbs boiling, and tearing and mangling; and he the great director of all, and, in a word, discharging his place who sent him, the best deserving to be the king's late chief justice there, and chancellor after, of any man that breathed since Cain or Judas."

Lord Lowther writes that the stench was so great that the ways were not to be travelled whilst the horror of so many quarters of men, and the offensive stench of them, lasted; of which Ken, the bishop of Bath and Wells, wrote a most pathetic letter to his Majesty.

Besides these butcheries, 850 prisoners were transported to the plantations—in reality, sold as slaves to the planters, in a climate where field labor is certain death to Europeans; so that they are to be added to the number of victims. One of these was the son of a clergyman near Lyme, the Rev. J. Pinney.

The Taunton school-girls, who had worked the banner for Monmouth, were given as *Christmas-boxes* to the maids of honor to the queen; of whom their liberty was afterwards purchased for 7,000*l.*

It is estimated that Jeffreys cleared no less than 34,000*l.* by this assize, in bribes accepted for the escape or pardon of wealthy prisoners. From Mr. Prideaux, of Ford Abbey, who was undoubtedly innocent, he extorted the sum of 15,000*l.*

The total number killed during this rebellion is estimated by Mr. Roberts at 1,810, of whom 392 were executed by Jeffreys after its suppression.

ANECDOTE OF DUNNING.—On Mr. Dunning, the celebrated lawyer, being asked how he contrived to get through all his business, he replied, "I divide my business into three parts: the first part I do myself; the second part I get done for me; and the third is never done at all."

From Punch.

MRS. CAUDLE'S CURTAIN LECTURES.

CAUDLE HAS BEEN MADE A MASON.—MRS. CAUDLE INDIGNANT AND CURIOUS.

"Now, Mr. Caudle—Mr. Caudle, I say: oh! you can't be asleep already, I know—now, what I mean to say is this; there's no use, none at all, in our having any disturbance about the matter; but, at last my mind's made up, Mr. Caudle; I shall leave you. Either I know all you've been doing to-night, or to-morrow morning I quit the house. No, no; there's an end of the marriage-state, I think—an end of all confidence between man and wife—if a husband's to have secrets and keep 'em all to himself. Pretty secrets they must be, when his own wife can't know 'em. Not fit for any decent person to know, I'm sure, if that's the case. Now, Caudle, don't let us quarrel; there's a good soul, tell me what's it all about! A pack of nonsense, I dare say; still—not that I care much about it—still, I *should* like to know. There's a dear. Eh? Oh, don't tell me there's nothing in it; I know better. I'm not a fool, Mr. Caudle; I know there's a good deal in it. Now, Caudle; just tell me a little bit of it. I'm sure I'd tell you anything. You know I would. Well!

"Caudle, you're enough to vex a saint! Now, don't you think you're going to sleep; because you're not. Do you suppose I'd ever suffered you to go and be made a mason, if I did n't suppose I was to know the secret, too! Not that it's anything to know, I dare say; and that's why I'm determined to know it.

"But I know what it is; oh yes, there can be no doubt. The secret is, to ill-use poor women; to tyrannize over 'em; to make 'em your slaves; especially your wives. It must be something of the sort, or you would n't be ashamed to have it known. What's right and proper never need be done in secret. It's an insult to a woman for a man to be a free-mason, and let his wife know nothing of it. But, poor soul! she's sure to know it somehow—for nice husbands they all make. Yes, yes; a part of the secret is to think better of all the world than their own wives and families. I'm sure men have quite enough to care for—that is, if they act properly—to care for them they have at home. They can't have much care to spare for the world besides.

"And I suppose they call you *Brother Caudle*! A pretty brother, indeed! Going and dressing yourself up in an apron like a turnpike man—for that's what you look like. And I should like to know what the apron's for! There must be something in it not very respectable, I'm sure. Well, I only wish I was queen for a day or two. I'd put an end to free-masonry, and all such trumpery, I know.

"Now, come, Caudle; don't let's quarrel. Eh! You're not in pain, dear! What's it all about! What are you lying laughing there at! But I'm a fool to trouble my head about you.

"And you're not going to let me know the secret, eh! You mean to say—you're not! Now Caudle you know it's a hard matter to put me in a passion—not that I care about the secret itself; no, I would n't give a button to know it, for it's all nonsense I'm sure. It is n't the secret I care about: it's the slight, Mr. Caudle; it's the studied insult that a man pays to his wife, when he thinks of going through the world keeping

something to himself which he won't let her know. Man and wife one, indeed! I should like to know how that can be when a man's a mason—when he keeps a secret that sets him and his wife apart? Ha, you men make the laws, and so you take good care to have all the best of 'em to yourselves: otherwise a woman ought to be allowed a divorce when a man becomes a mason. When he's got a sort of corner-cupboard in his heart—a secret place in his mind—that his poor wife is n't allowed to rummage!

"Caudle, you shan't close your eyes for a week—no, you shan't—unless you tell me some of it. Come, there's a good creature; there's a love. I'm sure, Caudle, I would n't refuse you anything—and you know it, or ought to know it by this time. I only wish I had a secret! To whom should I think of confiding it, but to my dear husband! I should be miserable to keep it to myself, and you know it. Now, Caudle!"

"Was there ever such a man! A man, indeed! A brute!—yes, Mr. Caudle, an unfeeling, brutal creature, when you might oblige me, and you won't. I'm sure I don't object to your being a mason; not at all, Caudle; I dare say it's a very good thing; I dare say it is—it's only your making a secret of it that vexes me. But you'll tell me—you'll tell your own Margaret! You won't! You're a wretch, Mr. Caudle."

"But I know why: oh, yes, I can tell. The fact is, you're ashamed to let me know what a fool they've been making of you. That's it. You, at your time of life—the father of a family. I should be ashamed of myself, Caudle."

"And I suppose you'll be going to what you call your Lodge every night, now. Lodge, indeed! Pretty place it must be, where they don't admit women. Nice goings on, I dare say. Then you call one another brethren. Brethren! I'm sure you'd relations enough, you did n't want any more."

"But I know what all this masonry's about. It's only an excuse to get away from your wives and families, that you may feast and drink together, that's all. That's the secret. And to abuse women—as if they were inferior animals, and not to be trusted. That's the secret; and nothing else."

"Now, Caudle, don't let us quarrel. Yes, I know you're in pain. Still, Caudle, my love; Caudle! Dearest, I say! Caudle! Caud—"

"I recollect nothing more," says Caudle, "for here, thank Providence! I fell asleep."

MR. CAUDLE HAS BEEN TO GREENWICH FAIR.

HEM!—So, Mr. Caudle: I hope you enjoyed yourself at Greenwich. How do I know you've been at Greenwich! I know it very well, sir: know all about it: know more than you think I know. I thought there was something in the wind. Yes, I was sure of it, when you went out of the house, to-day. I knew it by the looks of you, though I did n't say anything. Upon my word! And you call yourself a respectable man, and the father of a family! Going to a fair amongst all sorts of people—at your time of life. Yes; and never think of taking your wife with you. Oh no! you can go and enjoy yourself out, with I don't know who: go out, and make yourself very pleasant, I dare say. Don't tell me; I hear what a nice companion Mr. Caudle is: what a good-tempered person. Ha! I only wish peo-

ple could see you at home, that's all. But so it is with men. They can keep all of their good temper for out-of-doors—their wives never see any of it. Oh dear! I'm sure I don't know who'd be a poor woman!

"Now, Caudle, I'm not in an ill temper; not at all. I know I used to be a fool when we were first married: I used to worry and fret myself to death when you went out: but I've got over that. I would n't put myself out of the way now for the best man that ever trod. For what thanks does a poor woman get? None at all. No: it's those who don't care for their families, who are the best thought of. I only wish I could bring myself not to care for mine."

"And why could n't you say, like a man, you were going to Greenwich Fair when you went out! It's no use you're saying that, Mr. Caudle: don't tell me that you did n't think of going; you'd made your mind up to it, and you know it. Pretty games you've had, no doubt! I should like to have been behind you, that's all. A man at your time of life!"

"And I of course, I never want to go out. Oh no! I may stay at home with the cat. You could n't think of taking your wife and children, like any other decent man, to a fair. Oh no; you never care to be seen with us. I'm sure, many people don't know you're married: how can they! Your wife's never seen with you. Oh no; anybody but those belonging to you!"

"Greenwich Fair, indeed! Yes—and of course you went up and down the hill, running and racing with nobody knows who. Don't tell me; I know what you are when you're out. You don't suppose, Mr. Caudle, I've forgotten that pink bonnet, do you? No: I won't hold my tongue, and I'm not a foolish woman. It's no matter, sir, if the pink bonnet was fifty years ago—it's all the same for that. No: and if I live for fifty years to come, I never will leave off talking of it. You ought to be ashamed of yourself, Mr. Caudle. Ha! few wives would have been what I've been to you. I only wish my time was to come over again, that's all; I would n't be the fool I have been."

"Going to a fair! and I suppose you had your fortune told by the gipsies? You need n't have wasted your money. I'm sure I can tell you your fortune if you go on as you do. Yes, the gaol will be your fortune, Mr. Caudle. And it would be no matter—none at all—if your wife and children did n't suffer with you."

"And then you must go riding upon donkeys—you did n't go riding upon donkeys! Yes; it's very well for you to say so; but I dare say you did. I tell you, Caudle, I know what you are when you're out. I would n't trust any of you—you, especially, Caudle."

"Then you must go in the thick of the fair, and have the girls scratching your coat with rattles! You could n't help it, if they did scratch your coat! Don't tell me; people don't scratch coats unless they're encouraged to do it. And you must go in a swing, too. You did n't go in a swing! And I'm a foolish woman to think so, am I? Well, if you did n't, it was no fault of yours; you wished to go, I've no doubt."

"And then you must go into the shows! There—you don't deny that. You did go into a show. What of it, Mr. Caudle! A good deal of it, sir. Nice crowding and squeezing in those shows, I know. Pretty places! And you a mar-

ried man and the father of a family. No, I won't hold my tongue. It's very well for you to threaten to get up. You're to go to Greenwich Fair, and race up and down the hill, and play at kiss in the ring. Pah! it's disgusting, Mr. Caudle. Oh, I dare say you *did* play at it; if you did n't, you'd have liked, and that's just as bad;—and you can go into swings, and shows, and roundabouts. If I was you, I should hide my head under the clothes, and be ashamed of myself.

"And what is most selfish—most mean of you, Caudle—you can go and enjoy yourself, and never so much as bring home for the poor children a gingerbread-nut. Don't tell me that your pocket was picked of a pound of nuts. Nice company you must have been in to have your pocket picked.

"But I dare say I shall hear all about it to-morrow. I've no doubt, sir, you were dancing at the Crown-and-Anchor. I should like to have seen you. No: I'm not making myself ridiculous. It's you that's making yourself ridiculous; and everybody that knows you says so. Everybody knows what I have to put up with from you.

"Going to a fair, indeed! At your time—"

"Here," says Caudle, "I dozed off, hearing confusedly the words—hill—gipsies—rattles—roundabout—swings—pink bonnet—nuts."

From the Spectator.

PUNISHMENT AND CORRECTIVE DISCIPLINE.

THE necessity of dealing with convicts *en masse* is a great obstacle to their reformation. Man is a social animal—if company is within his reach he will keep it: man is a partisan animal—he will tolerate, defend, adopt, the views and habits of those with whom he keeps company. If you could separate a convict from all old associations—throw him among people entirely new to him, industrious, and tolerably regular in their conduct—he might adopt their fashions. But so long as he is known to and within reach of the criminal class, his reformation is next to impossible.

Captain Maconochie, some years at the head of the doubly-penal settlement on Norfolk Island, makes an observation that shows how far corrective influences may in a manner refine and elevate the character of convicts, leaving their morals little if anything amended. The view he presents is a curious counterpart to Burke's assertion that the moral delinquencies of French aristocracy, by losing all their grossness, lost half their evil. The convicts of our day, like the noblesse of the ancient régime, have been raised in the scale of humanity without being lifted out of their class.

"The degree of education among the younger English prisoners is higher than among the old ones. When they read or write at all, they do both better than the others. Their minds are also generally more active and educable; they covet a better class of books, and more readily acquire general though superficial information from them. It would appear as though the spirit of advancing intelligence in the age has touched even where it has not directly seized on particular individuals. I have never known a voluntary adult school so generally, and at the same time for the most part so profitably attended, as ours was at Longridge, till the formation of the establishment at Cascade, and the distribution of the men holding tickets of leave into farms, unavoidably broke it up. • •

On the other hand, I am sorry to add, that these same young English prisoners, who are thus distinguished among us for superior education and educability, are not less remarkable for indifference to their religious duties and careless reception of religious instruction. In both particulars, it is curious to say that they not unfrequently even give offence to the older hands. Whatever the cause, the older prisoners, without being always the better men for it, are peculiarly accessible to religious exhortation and impression, and show much respect to religious addresses. They thus come readily to church; they listen with extreme attention to any sermon in the least suited to them; and they are frequently even deeply moved by one bearing on their individual circumstances. • •

But, as a class, the young English prisoners exhibit here appearances almost the reverse of these. They come unwillingly to church; they not unfrequently misconduct themselves there. I have had occasion to sentence many to sit for different periods on the front-benches, immediately in my own view: and several even have been brought before me by their better-minded companions for arguing that religion was a hoax, supported by the better classes in order to control the lower."

But both skeptics and devotees are equally unreclaimed. They want only opportunity to resume their old practices. The one set take to intellectual pursuits, as an amusement: the other to religious, because while indulging in a devotional feeling they soothe themselves with the flattering hope that they have become better men. But in both, the real source of crime—the habitual prostration of the will, the more or less reluctant submission to habit—has not been reached. They lack vigor for self denial and steady industry: they have no power to originate a new line of conduct for themselves: they will do as they are directed while prisoners, and as others do when liberated. They will follow the example of their associates; and these, sifted and classified as men are now-a-days by the police, must be criminals. To reclaim a man, it is not enough that you render him intelligent and convince him of the folly of crime, or awaken his sense of religion and make him feel vaguely the evil of crime: his will requires to be braced; and that, it would almost appear, cannot be effected while he is undergoing punishment. The following remark of Captain Maconochie bears on this point, and is perhaps still more striking than the one we have already quoted—

"In general, the men here die quietly and composedly; resigning themselves with little apparent reluctance to their fate, and receiving and applying, even the worst of them, to their own cases the consolations of religion, with little apparent doubt or hesitation. There are exceptions—men who die obdurate and impenitent, and men who show great uneasiness about their future prospects: but the reverse is the rule; and it is, think, to be lamented. A more painful death, in the case of very wicked men, would be salutary to survivors, and probably more beneficial to themselves. The circumstance proceeds, I think, from two causes: first, the ties of a prisoner to life are not strong, and his habits of enterprise reconcile him readily to any change; and secondly, the moral guilt of their several offences is little felt by the body at large. They have for such a length of time looked to them as their only sources of indulgence and subsistence, that they have almost ceased

to consider them as involving moral guilt at all. The degree in which I can trace this even in the minds of my best men is wonderful; and it proceeds, in a great degree, from the system of measuring sentences by time instead of conduct. Conduct has thus no prominent value attached to it in their every-day life, and misconduct no directly injurious effect; while other circumstances also conspire. *Men long kept without personal property have little sympathy with the moral reasoning which would protect property; and where submissiveness is the only virtue directly rewarded, the others speedily lose value by comparison.*"

Self-defence requires that those who are inaccessible to other motives be deterred from crime by the prospect of punishment. Humanity requires, that instead of killing or coercing our fellow-beings like wild beasts when they are guilty, we should attempt to teach them better. Men like to save themselves trouble: the attempt has therefore been made to punish and teach delinquents at the same time and by the same process. But punishment only deters from crime: it awakens all the angry feelings of a thwarted will. Prolonged punishment renders this state of mind chronic, or superinduces hopelessness and entire prostration. These considerations would seem to suggest that the best punishments are those which are sharp but brief in their operation—which terrify without rendering the mind habitually savage or feeble. The process of reform, it would seem, must be begun after the punishment is over. But to this an insurmountable hindrance is interposed by the modern habit of viewing all who have once been convicted as a degraded caste, which precludes the return of the criminal into unconvicted society, and thrusts him back to associate exclusively with convicts like himself.

We are still in the rudiments of penal legislation and corrective discipline. To abolish death-punishment—if life-long bondage which kills the soul, or a life spent alternately in prisons and the pursuit of crime, are the only substitutes—would be little advance in the path of humanity.

PUNCH'S NOY'S MAXIMS.

23. *Nothing shall be void which may by possibility be good.*—This maxim is proved by taking the negative of the proposition. Thus, if JONES writes a tragedy, it cannot by any possibility be good, and it is therefore void accordingly; but if JONES incurs a debt, the debt may by possibility be good; and at all events it is not void, for the liability will hang over him.

24. *Ex nudo pacto non oritur actio.*—An action cannot arise from a naked agreement.—A naked agreement is an agreement not clothed with a consideration; and certainly it seems very inconsiderate to allow an agreement to go forward to the world in the state alluded to. Among some of the jurists it is thought that the reason why no action arises from a naked agreement is, that such an agreement being naked, must have been already stripped of everything; and as there is nothing to be got from it, the lawyers will have nothing to do with it.

25. *The law favors a thing which is of necessity.*—This is the doctrine of "needs must when a certain old gentleman drives;" and the law favors anything which he happens to be concerned in. That the law favors necessity, is not, however, wholly true; for if a man has stolen a penny-loaf

from necessity, the law has no favor to show to it. If in a storm another man throws overboard my goods, he is protected, because the law sees a necessity, and favors it accordingly; though I might see no necessity whatever for such a precipitate proceeding. The idea of law favoring necessity, is at variance with the maxim that "necessity has no law," which is very likely to be the truth, for necessity not being able to pay for law, is not very likely to get any.

26. *The law favors a thing which is for the good of the commonwealth.*—In accordance with this maxim, a man in trade may not have his tools distrained upon, for he uses them for the good of the commonwealth; and a bailiff cannot come up and take my pen out of my hand, for it is the tool I am working with; nor could he seize my brains, for they are what I have in use; though he might levy a distress on my mind, by greatly distressing it.

27. *Communis error facit jus.* Common error becomes right.—This is a very odd maxim, for it means literally that rare correctness will be the result of constant blundering; and it follows that a man who is generally wrong, will be in the end particularly right. Thus, in the Irish courts, if there is a row, and every man strikes the wrong person, there can be no doubt that the right person will get what he deserves; and thus the *communis error*, or general mistake, *facit jus*—that is to say, is the cause of justice being done.

28. *The law favors things which are in the custody of the law.*—The sort of favor shown by the law to such as are in its custody, is of a very peculiar character. Cutting the hair in the very last style of fashion—the last that any one would voluntarily adopt—and attending to the health by prescribing constant exercise on the wheel, together with a diet of the most moderate nature, are among the favors which the law shows to those who are in its custody.

29. *The husband and wife are one person.*—Though man and wife are one in law, they are often two in fact, for there is anything but unity between them. They cannot sue each other—at least after marriage—though before that event the gentleman brings his suit, but when once wedded they stand no longer in the relation of suitors. A wife can never answer any action without her husband, for it is wisely thought that if a woman were allowed to answer alone, or in other words, have all the talk to herself, there would be no end to it. If a married woman is guilty of slander, the husband and wife must be sued for it, so that a man saddled with a scurrilous helpmate ought to put a bridle on her tongue as speedily as possible.

30. *All that a woman has appertains to her husband.*—Among the other things appertaining to a woman are sometimes debts and liabilities, which her husband takes, whether he will or no; but when the wife pays the debt of nature, the other debts are discharged, as far as the husband is concerned, who thus obtains a release in a double sense.

31. *The will of the wife is subject to the will of the husband.*—This is a maxim that our married readers will find it difficult to understand; for it is a settled point, which has been decided over and over again after much argument, that a wife has a will of her own, which the will of a husband must often be subject to.

32. *The law favors works of charity, right, and truth, and abhors fraud, covin, and uncertainties,*

which obscure the truth; contrarieties, delays, unnecessary circumstances, and such like.—“The law,” if we are to judge by this maxim, must have a very high opinion of itself; and it is only to be regretted that society at large does not consider the law such a paragon of perfection as it makes itself out to be. The way in which the law favors works of charity, is by squabbling over the funds left for charitable purposes until they are pretty considerably diminished. If the law really loves right and truth, it is strange that it should be so constantly at variance with those it professes to have an affection for. The differences existing between law and right are, however, very unlike lovers’ quarrels, inasmuch as the former, when they once take place, are seldom made up again. On the whole, the maxim now under discussion appears to smack of pleasantry; for it must surely be a joke to say that the law abhors “uncertainties which obscure the truth.” Perhaps, however, it is an excess of magnanimity of the law, which induces it to patronize those things which it holds in the greatest detestation.

36. *Every act shall be taken most strictly against him who made it.*—This is a very good maxim, but it is not faithfully carried out; for if it were, the framers of the Poor Law Act would be occasionally subjected to its provisions. The individual who made a brazen bull for the purpose of torturing others, and was himself the first victim to his new invention, had his act taken most strictly against himself; and if acts of parliament were to be applied strictly to those who made them, it is probable that there would be considerable improvement in the quality of legislation. If I give A. B. a gold snuff-box, saying, “A. C., take this,” it is a good gift, though I call him by a wrong name; but if I call him wrong names, and he, giving me a box on the ears, says, “B. D., take that,” the gift is not so good as it might be.

37. *He who cannot have the effect of the thing, shall have the thing itself. Ut res magis valeat quam pereat.* It is better a thing should have effect than be void.—This maxim is somewhat ambiguous, but it means simply that where there is no meaning in a sentence, the law will make one, rather than refrain from interfering. Formerly, however, the better mode of reading the maxim would have been by saying, “he who cannot have the effects of the thing shall have the thing itself;”—for until arrest was abolished—and even still in some cases—if a broker cannot have the effects he will have the person, and if he returns *nulla bona*—which means literally nothing to bone—he could formerly bone the body.

ENIGMA.

I’m reckoned only fifty—yet for centuries have been
In every place, in every clime, among the living seen.
Mute, though incessantly in talk, I give to silence sound,
And single ’t is my fate to be, whilst fast in wedlock bound.
The learned place me at their head, although unknown to fame,
And eloquence itself delights to sound abroad my name.

Though plunged in guilt, the tenant of a prison’s gloomy cell,
Yet twice invoked, my potent aid concludes the wizzard’s spell:

I ride upon the whirlwind—point the lightning through the storm,
And mine the power, with but a word, another world to form.

I too, alone can kindle fame, and what, indeed, is odd,
The veriest miser can prevent from making gold his God.

I usher in the morning light, yet shun the face of day;
A stranger to the voice of mirth, yet join in every play.

The fabled liquid I, with which poor Tantalus was curs’d,
For in the proffered goblet seen, I mock the wretch’s thirst.

The rich secure me for their wealth, the cunning for their wiles!
And rest of me, ah! changed how soon were beauty’s sweetest smiles.

I lurk within the brilliant glance that flashes from her eye—
Rest on her ruby lip—and in her laughing dimples lie—

I breathe the first soft sound of love in the maiden’s willing ear,
And mingle in the rising blush which tells that love is dear.

I lead the laugh, I swell the glee amid the festal hall,
But a truant from the banquet, and a laggard in the ball.

First in the martial lists I rode, with mail, and lance, and shield;
And foremost of the line I charge upon the battle field;

And yet though ranked among the bold, I scarcely join the fight,
When, foul disgrace to knighthood’s race, I turn at once to flight.

From greatness thus removed, I make companionship with evil;
And, in your ear a word, maintain alliance with the devil.

I THINK OF THEE.

I THINK of thee in the night,
When all beside is still,
And the moon comes out with her pale sad light
To sit on the distant hill.

When the stars are all like dreams,
And the breezes all like sighs,
And there comes a voice from the far-off stream
Like thy spirit’s low replies.

I think of thee by day,
Mid the cold and busy crowd,
When the laughter of the young and gay
Is far too glad and loud.

I hear thy low sad tone,
And thy sweet young smile I see,
My heart were all alone
But for its thoughts of thee.

T. K. Hervey.

From the Quarterly Review.

Diaries and Correspondence of James Harris, First Earl of Malmesbury, containing an Account of his Missions to the Courts of Madrid, Frederick the Great, Catherine II., and the Hague; and of his special Missions to Berlin, Brunswick, and the French Republic. Edited by his Grandson, the Third Earl. Vols. III. and IV. London. 1844.

TOWARDS the conclusion of our recent notice of the two first volumes of this series, we said—"we suppose that a further publication is intended, which perhaps has been postponed from considerations of delicacy towards persons still living." We find, however, that we were mistaken in supposing that there was any delicacy in the case—the postponement seems to have been but another instance of the practice which has of late grown up of bringing out in *livraisons* works which might as well, for aught we see, have been brought out at once. We may hereafter have occasion to make some observations on the effect of this system, but we notice it on this occasion only because it led us into expectations which have been disappointed, and has obliged us to divide into two articles a subject which we should rather, on account of some principles which it involves, have discussed in one.

If these latter volumes of Lord Malmesbury's diaries and correspondence were to be published in our day, they must naturally have excited considerable surprise in the public mind, and have raised—in addition to the suggestion which we made as to the respect due to private feelings—the more important question as to the right of a public minister or his representative to publish, at his private pleasure and for his private objects, documents or information obtained in his public character and in the execution of his official duties. This abstract question might have been raised in the case of even the two first volumes, where there are many things which ought not, we think, to have been published as part of the official or even private correspondence of a British minister; but as they related to days comparatively remote, and to interests for the most part obsolete, and as we presumed (erroneously it seems) that a discreet pause was made for the purpose of precluding any complaints either public or private, of too near an approach to our own times, we forbore raising a question which might seem invidious, and which the good sense and delicacy of the noble editor himself appeared to avoid; but, as the appetite of the public for these revelations, and the profit-prompted liberality of the possessors of such documents, seem rapidly increasing, we feel it our duty to offer some observations on a subject of, as it seems to us, some novelty and considerable importance.

We must begin by stating that these volumes contain matters so various as to be at first sight hardly reducible to any common rule as to the right or propriety of their publication. We have, 1. The ordinary official despatches and communications between the minister and his own court, and that to which he was accredited. 2. The more secret and confidential correspondence, which under the form and style of private letters are essentially official, and affect in the highest degree the public interests. 3. Memoranda, minutes of conferences, or conversations, and intelligence, collected in the ministerial character, and for the

purposes of the mission. 4. Extracts of Diaries which Lord Malmesbury seems to have kept with great assiduity all through his life, and of which, during the periods of his public employment, all the most essential portions relate to his ministerial duties, and are as it were a kind of log-book of his official and in some degree of his personal proceedings:—the fourth volume is almost wholly composed of extracts from the Diary from 1801 to 1808, when Lord Malmesbury was residing in London in the centre of an extensive political acquaintance, and keeping very copious notes of the political news and occurrences of the day.

Of these classes there can be little doubt, we think, that the three first may be considered as belonging to the same category, and as subject to whatever custom or rule of law may exist as to the antagonist rights of the crown, and one of its official agents, over the documents connected with the agency. The question on the Diaries is rather more complicated, from the difficulty of distinguishing how far papers of such a mixed character can be classed as public or private. But the difficulty is more superficial than real: on the one hand, no one can pretend that Lord Malmesbury's representative had not a *legal* right over his *private* diaries; those, for instance, kept when he was out of office; but on the other it may, we think, be doubted whether such a right extends to a journal like, for instance, that kept during his mission to Brunswick, which is really a history of the mission—containing scarcely one word or fact that had not a direct relation to it, and which but for the mission could have had no existence.

Now, putting aside for the moment all question of discretion and delicacy, and regarding only the *strictness of law*, we hold that it is clearly established that a public minister can have, with regard to his official papers, no private and independent right of publication.

Judge Story, in his "Commentaries on Equity Jurisprudence," has collected all the cases which constitute the law on this subject, and classed and condensed them in his usual masterly style. He states, on all the authorities, that "private letters, even as literary compositions, belong to the writer and not to the receiver, who at most has a special property in them which does not give him a right to publish them," (§ 944;) and again, that "by sending a letter the writer gives to the person to whom it is addressed a property in it for the purposes of reading, and, in some cases, of keeping it; but the gift is so restrained that, beyond the purposes for which the letter is sent, the property remains in the sender," (§ 945.) These decisions were made on the principle involved in this and all such like cases, namely, the *copyright* in and the pecuniary value of such papers. But the argument goes still further, and protects letters, not merely as *property*, but as the sacred depositories of *private confidence*. "It would, indeed," says Dr. Story, "be a sad reproach to English and American jurisprudence if courts of equity could not interpose in cases where the very nature of the letter imports—as matters of business, or friendship, or advice, or family or private confidence—the *implied* or necessary intention and *duty* of privacy and secrecy," (§ 947;) and thence the cases lead to a still closer analogy to our point. "*Courts of equity will restrain a party from making a disclosure of secrets communicated to him in the course of a confidential employment,*" (§ 952.)

And he further shows that these rules apply not merely to letters received, but equally so to letters written by a person—in short, “they have been applied in all cases where the publication would be a violation of trust or confidence, founded in contract or implied from circumstances,” (§ 949.) And, if this doctrine be true in private cases, it is infinitely stronger in that of a sworn servant of the state, who is not merely what the law would call an agent, but is invested with a still more confidential character, and a much higher, and much deeper responsibility. This is common sense, common honesty, common equity, and common law.

A case occurred a few years ago, in which we had occasion to consider this question incidentally, and our opinion then was in perfect accordance with these principles. This was in our review of “*A Narrative of a Residence at the Court of London, by Richard Rush, Esq.*,” envoy from the United States. Mr. Rush in this work chose to publish, without any authority from his government, and on his private responsibility, many of his diplomatic communications with our ministers, and gave some reasons—very bad ones as we thought and showed—for this deviation from the ordinary course of diplomacy. For our present purpose we need only quote our general *résumé* of the question. The first part of our argument had applied to the mere act of publishing what had never been intended for publication, and then we proceeded to say with regard to the publication by Mr. Rush—

“But Mr. Rush is in a still graver error as to the general principle. He seems to think that, if such documents may be published, he has a right to publish them. No such thing. The state has such a right, but not the servant of the state, without the express permission of the head of the government. In all a minister’s negotiations, whether verbal or documentary, he can acquire no personal right—no right to publish or otherwise employ the papers he may have collected, or the information he may have obtained, for any purpose of his own. The whole belongs to the state, and he has no more right to make any use of them than a lawyer would have to turn something which he has found amongst his client’s title-deeds to his own advantage.”—(Q. R., xlix., p. 325.)

To this general doctrine we have never heard any objection: we believe it to be indisputable, and we will therefore venture to repeat our mature judgment—one not, as we have shown, formed on or for the present occasion—that the noble editor had no right whatsoever to publish the diplomatic papers of his grandfather. We have no doubt that such a publication might have been stopped by an injunction; and as the case now stands, we suspect that the law of copyright would not protect a publication where there was no right to publish.

But this applies only to the absolute right—which is, we admit, susceptible of various modifications in practice. In the first place the consent of the government for the time being, as representative of the sovereign or the state, would hardly be denied on a fit occasion, and would remove all difficulty. Of the two earliest publications by private persons of diplomatic papers that we possess—“*The Cabala*” and Diggs’ “*Complete Ambassador*”—it is observable that both, and particularly the latter, referred to transactions quite obsolete, and were published during the license of the

commonwealth, but that when the “*Cabala*” was republished after the restoration with some additional matter, it was with the express sanction of the secretary of state. The second volume of Sir William Temple’s works, published by Swift, which contained his diplomatic letters, was especially dedicated to King William—which the first volume was not—and had no doubt his majesty’s countenance and sanction. But we have now before us a case of recent and decisive authority—Sir Robert Adair’s publication, May, 1844, of “*An Historical Memoir of his Mission to Vienna*.” This memoir is based on, and is accompanied by, a selection from the dispatches written and received by him during that period. Sir Robert Adair, taking the true legal and statesman-like view of the case, obtained from Lord Palmerston, then the secretary of state, “*an official permission—not withdrawn by Lord Aberdeen—to publish such parts of his dispatches as might not be prejudicial to the public service;*” and he also, he tells us, obtained “*Prince Metternich’s consent;*” and he announces on his title-page that these dispatches are “*published by permission of the proper authorities.*” All this is right and proper, and establishes, we think, the true principles of the case.

But though we suppose that in strictness no state-papers can be printed without the consent of the crown, yet in practice any formality of sanction has been reasonably considered as unnecessary in cases which, by long lapse of time and entire change of circumstances, can no longer affect either private feelings or public interests, and have passed into the fair and undisputed domain of history. It might be difficult to fix the precise boundary of this domain, in which every year makes a degree of change; but it is creditable to the discretion of the eminent men who have served in public stations for the last century—of the hereditary possessors of their official papers—and of the literary men who have had access to those papers—that till within very late years little or nothing has been published to which any serious objection could be made. When Lord Kenyon and Dr. Phillpotts published, in 1837, the letters between the king and Lord Chief Justice Kenyon on the subject of the Coronation Oath, Lord Chancellor Eldon—with all his political and religious predilections for the views that publication was intended to serve—could not help expressing “*considerable doubts*” as to the propriety of the publication, (Twiss’ “*Life*,” vol. i., p. 360)—not from any disapprobation of the sentiments, nor doubting that they did honor to both parties, but evidently because it seemed to make public a privileged communication too near our times to be altogether considered, as in all other respects they certainly are, historical documents. Lord Eldon’s own biographer, who states this doubt, has gone much farther, for he has printed not only private letters of recent date, but a number of the most secret and confidential notes from King George III. to his chancellor on the most delicate subjects. In our review of Mr. Twiss’ work (Q. R., vol. lxxiv., p. 71) we said that, taking for granted that Mr. Twiss had obtained permission from the parties or their representatives for the publication of these private communications, there were still some for which it was too early even to ask such permission—a sufficient intimation of the judgment which we now more broadly state—that without such permission, those documents were, according to

all admitted principles, no more the property of the chancellor's grandson, in respect to *publication*, than Lord Malmesbury's dispatches were of his grandson. It seems clear that the present earl has not thought of obtaining any such permission or sanction, and for this as well as other reasons we cannot but think that his publication infringes on those *ill-defined*, but *well understood*, rules of discretion and delicacy, by the nice observance of which the publication by private hands of official documents can alone be justified.

We are satisfied that the noble editor had not the least intention of infringing these rules, and will be surprised at finding that he can, by any ill-natured critic, be supposed to have done so. We assure him we are not towards him ill-natured critics;—we are satisfied that he was as far as we ourselves should be from publishing anything which he could have imagined to be injurious to the public service or reasonably displeasing to individuals. But in our judgment he has happened to do both; and it is lest the involuntary error of a justly respected nobleman should in these all-publishing days create a dangerous precedent, that we have thus ventured to express our opinion that *strictly speaking*, the official and confidential—that is, the greater and more important—divisions of these papers were not *his to publish*, and that the customary and conventional rights which a sufficient lapse of time confers on the possessor of such documents have not yet accrued to him.

We are sorry to be obliged to pronounce this judgment, which is much against our own private interest and predilections. We have been very much amused by these two latter volumes, and chiefly, we fear, with those parts the publication of which we have thus presumed to criticise. We wish we could, consistently with our duty to the public, encourage this mode of anticipating history: it has great charms. How much more delightful to us must be the sketches of George III. and George IV.—Queen Charlotte and Queen Caroline—Pitt and Fox—Canning and Windham—to say nothing of the minor portraits—all fresh, as it were, from the hand of a painter, *their* contemporary, and in some degree *ours*—than they will be in another generation, when they might be exhibited without offence, and received with indifference! Nor can it be denied that historic truth may gain something by what we have hitherto considered as premature publication. If there be misunderstanding or misrepresentation of facts or of motives, there may probably be those living who will feel an interest in correcting the error and in doing justice to themselves or their party; and when the mention is favorable, there will be many to relish the praise of a well-remembered parent or friend, with a keenness of pleasure that cannot be felt by a more distant progeny. It may be also said that no such publication is ever made without *some* reserve and delicacy—that even when nothing is added to praise, something is often subtracted from censure, and that traits likely to be offensive to individuals may be easily, and generally are tenderly softened or omitted: and this, we dare say, may be said of the Malmesbury publication. But then this process is likely to destroy the truth and unity of the work: after being strained through such a cullender an author may be no more like himself than a *purée* to a potato. Unless we have the *whole* evidence we cannot be satisfied of his veracity, nor appreciate his distri-

bution of praise or blame. It is like asking us to give implicit credit to a witness without allowing us the test of a personal examination.

Upon the whole, however, of these considerations, we fall back to our original position that such publications are of very doubtful propriety, and that in the present instance it has been somewhat premature as regards individuals, and somewhat incautious as affects national interests; and we solicit the attention of the public and the government to the inconveniences which may arise if this practice of dealing with official documents as private property should become—as from the taste of the times, and the activity of the literary trade, we think probable—an ordinary speculation with the sons and grandsons of public servants. Take three or four instances. The Armed Neutrality twice died away; but is another revival impossible, and would the maritime interests of this country be much strengthened by an appeal to Lord Malmesbury's Russian correspondence? Is the union of France and Spain against England so entirely out of the question that some British negotiator may not be told on the authority of Lord Malmesbury, or *Lord St. Vincent*, (!) that Gibraltar is worthless, or at best but a counter on the great card-table of Europe? Will it tend much to exalt our character for honesty and good faith, to have it said that a British minister of the highest rank prided himself on having *bribed* the menial servant of a friendly sovereign to betray the humble duty of opening or closing the door of his master's closet? Or will European confidence in our national pride and integrity be in any degree confirmed by the fact that pending the Lisle negotiations, we received, not only without indignation, but with complacency, projects of pecuniary corruption, which, if it disgraced our adversaries to propose, it did us no great honor to listen to? In four large volumes, pretty nearly divided between twaddle and gossip, such passages as we have referred to may be overlooked by ordinary readers; but we submit it to graver judgments, and even to public opinion, whether—be they truly represented, or, as we rather hope, discolored and exaggerated—these arcana are fit to be divulged in the style and for the motives with which they are now presented to the world.

Turning, however, from these speculations, which, though they come too late in this case, may be applicable to others, we proceed to our examination of the contents of these volumes, premising, once for all, that our space will allow us to give a very inadequate summary of so great a variety of transactions, and that we shall chiefly endeavor to bring before our readers topics on which Lord Malmesbury either throws a new light, or gives, in doubtful points, a preponderating evidence.

We left Lord Malmesbury at the close of the last volume separated in politics from Mr. Fox, and united with the Duke of Portland and his section of the whigs in the support of Mr. Pitt and the prosecution of the war with France. An early opportunity was taken, we will not say of rewarding his conversion, but of employing his known abilities and still greater reputation, in the public service. For any diplomatic duty he had certainly at that moment, in public opinion, no competitor; and the policy he was called upon to forward was in full accordance with his own previous opinions.

Towards the close of 1793, the King of Prussia

—under a strange combination of political embarrassment, private intrigue, and fanatical delusion—exhibited a strong disposition to break off his defensive alliance with England, and to withdraw from the contest against France—in which he had been, originally, the most zealous and prominent actor. Such a design, and especially the motives that prompted it, were so contrary to good faith, and so full of peril not only to Prussia herself but to all Europe, that Mr. Pitt and Lord Grenville proposed to Lord Malmesbury a special mission to endeavor to counteract this pusillanimous, and indeed, as regarded us, fraudulent policy, and to induce the King of Prussia to adhere to what was at once his duty to himself, and his engagement to his allies. Lord Malmesbury had, before his departure, an audience of George III. in the closet—"the first time since the *Regency Bill*"—on which, it will be recollected, Lord Malmesbury had not behaved with quite so much gratitude and duty as might have been expected. His majesty, however, was very gracious, and gave his lordship some advice on the subject of his mission, which, if only as an additional corrective of the false notions that were so long and so industriously propagated as to the infirmity of his majesty's intellect and judgment, is worth extracting.

"He began by saying something complimentary on my accepting the Prussian Mission, then went on by saying, 'A few clear words are better perhaps than long instructions. I believe that the King of Prussia is an honest man at the bottom, although a weak one. You must first represent to him, that if he allows his *moral* character the same latitude in his explanation of the force of treaties, as he has allowed it in other still more sacred ties' (referring to his marriage,) 'all good faith is at an end, and no engagement can be binding. You must then state to him how much his *honor* is engaged in joining in this business, in not giving up a cause in which he had begun so nobly. Then you should apply to his *interest*, that the event of the war must either fail or succeed; that if he withdrew himself from the number of coalesced powers, in either case he would suffer from leaving them. In the first case (the failure of the war) he perhaps would be the first to feel the consequence of suffering this *Tartarian horde* to overrun Europe. In the second, if we succeed, he certainly might be sure that not having contributed his share to the success, would put him, in respect to the other powers, in a situation of want of consideration and consequence, and that he would not be consulted or referred to in the general system of Europe, when that became a matter of discussion. That if you fail on referring him to these three great points—his *integrity*, his *honor*, and his *interest*—it will be certain nothing can be done; and although I have the greatest confidence in your skill and abilities, yet I shall rest assured in that case that no skill or any ability would be equal to success.'"—vol. iii., p. 7.

"And this," says Lord Malmesbury, "his majesty delivered with great perspicuity and correctness;" and then he went on to an explanation without which the first article of these oral instructions, as to the King of Prussia's moral conduct, would appear very strange—"The King of Prussia," he said, "was an *illuminé*;" and, as Lord Malmesbury afterwards found, persuaded himself—under the influences of that mysterious sect—that he might reconcile with strict morality the having a wife and three mistresses, and with

sound policy the forming an intimate alliance between his own despotism and the Jacobin democracy.

In one of the early letters from Berlin, Lord Malmesbury writes to Lord Grenville what surely ought not to have been yet—if ever—published:—

"My dear lord—The inside of this court is really a subject fit only for a private letter: unfortunately it is so closely connected with its public conduct, and influences it so much, that I wish to give you every information relative to it in my power.

"The female in actual possession of favor is of no higher degree than a servant-maid. She is known by the name of Mickie, or Mary Doz; and her principal merit is youth and a warm constitution. She has acquired a certain degree of ascendancy, and is supported by some of the most inferior class of favorites; but, as she is considered as holding her office only during pleasure, she is not courted, though far from neglected, by the persons of a higher rank.

"The two candidates for a more substantial degree of favor are Madlle. Vienk and Madlle. Bethman. The first (I really believe, extremely against her will and her principles) is forced forward by a party who want to acquire consequence; and I am told she has the good wishes of Luichesini, who thinks he shall be able to lead her. Madlle. Bethman plays a deeper game; she acts from, and for, herself; she professes to love the king, but that her principles prevent her giving way to it; she is all sentiment and passion; her aim is to be what his first mistress was, and to turn to her account all the licentious latitude it is said the *illuminés* allow themselves. Madlle. Bethman is cousin to the wealthy banker of that name at Frankfort, and, from what I have learnt there, is perfectly qualified to act the part she has undertaken."—vol. iii., p. 44.

The noble editor is rather at a loss to explain what the tenets of this religious or irreligious freemasonry of *Illuminés* were, and we cannot much help him. All that we know is, that it was a deep secret—and a very safe one withal—for we strongly suspect they did not know it themselves. Their principal rites seem to have been muddling, smoking, raising ghosts, and dealing with the devil—which devil was of a scale of intellect little above that of his votaries. But the influence of this folly became considerable in the dreamy twilight of German metaphysics, and had, at an early period—even in the time of the philosopher Frederick—made its way into the palace of Berlin, where the twin-sisters—infidelity and superstition—held rival, and yet congenial, courts. Wraxall tells us that the *quondam* hero Prince Ferdinand of Brunswick abandoned himself to the doctrines and reveries of the *Illuminés* till they reduced his once powerful mind to a state of imbecility. "It will hardly be believed," says Wraxall, "that prior to 1773 he was so subjugated by them as frequently to pass many hours of the nights in churchyards, engaged in evoking and endeavoring to raise apparitions." Old Frederick was forced to dismiss the poor visionary general from his public employments; but was not, it seems, able to check the growth of the mischief in his own family. We ourselves have heard, from indisputable authority, that the king whom Lord Malmesbury visited, (in addition to the moral or rather immoral *illumination* which we have mentioned,) was so preternaturally enlightened as to confound the

garden of Charlottenburgh with the garden of Gethsemane, and would reverentially take off his hat when he fancied that he met our Saviour in his walks.

But throughout this negotiation with Lord Malmesbury the Prussian monarch, however visionary—mad he might be in the garden, was in a very matter-of-fact state of mind in his cabinet; and the whole affair appears to have been on his part a greedy and unprincipled scheme to obtain the largest possible number of English guineas for services in which England had an interest—strong, no doubt, as part of the general cause against France,—but exceedingly inferior and remote compared with that of Prussia herself. The Prussian cabinet insisted on having their whole army of 100,000 subsidized! And when England was so liberal, or as we think extravagant, as to propose a sum of 2,000,000*l.* for the annual subsidy of that power, to be paid, 2-5th or 800,000*l.* by England, 1-5th by Austria, 1-5th by Holland, and the other 1-5th to be charged to Prussia herself, Prussia refused to contribute this quota, and insisted that her army should be fed and foraged into the bargain. And when this monstrous pretension was rejected, another still more monstrous was produced, as a conciliatory expedient forsooth—that Prussia would bear her quota, provided the subsidy was raised to 2,500,000*l.*—only a more impudent mode of reasserting that she would pay nothing at all. In the mean while Austria, most naturally, we think, declined to take any part of the expense of the Prussian army on her shoulders, and great distrust and acrimony arose between the courts of Vienna and Berlin, for which Prussia and her minister Lucchesini (probably sold to the French) were most to blame.

The negotiation was in this nearly hopeless state, when, as appears by the correspondence, the Prussian minister, Haugwitz, proposed to transfer it to the Hague. The editor states, in a note from the Malmesbury Papers, that this was an *artful suggestion of Lord Malmesbury* to get the negotiation out of the influence of Lucchesini and the French. We believe this is a mistake. In his private diary, Lord Malmesbury says that Haugwitz proposed and he accepted the change: and we cannot discover what possible motive Lord Malmesbury could have had for such a move. Haugwitz's is obvious—it relieved the King of Prussia from the presence of Lord Malmesbury, and the personal embarrassment of having to bear the brunt of the most infamous *escroquerie* that was ever attempted—it removed Lord Malmesbury from the capital, where the appearance of the court and the army contradicted the professions of extreme penury, on which the whole Prussian case rested—it removed him also from the auxiliary influence of the cabinet of Vienna—and finally, it threw him into Holland, where the pressure of the immediate danger and the necessity of the Prussian protection would be most severely felt. It was Lord Malmesbury's fortune, on this occasion, as it seems to have been all through life, to be baffled and bamboozled, or, to use the more modern, and, we suppose, politer term, *mystified*, and then, like a very able diplomatist, as he no doubt was, he *suggests*, though he does not venture to affirm, that it was all a subtle device of his own "cleverness." And truth obliges us to say—though it be said of the great Earl of Malmesbury—that a more *goosy* dispatch never met our eyes than that in which he announces with great

joy this change of place to Lord Grenville, together with a new project, by which Austria was to be left altogether out of the question; and we were to have the great advantage of reducing our subsidy from 800,000*l.* to only 750,000*l.*—a prodigious saving of *one sixteenth*, but accompanied by this slight drawback, that the force to be supplied for it was diminished in a rather larger proportion—from 100,000 to 60,000 men, or about *seven sixteenths*.

But even this would have been better than what was really obtained, for Lord Malmesbury signed, on the 19th April, a treaty, by which Prussia was to place 62,400 men at the disposal of England and Holland, at the price of 50,000*l.* a month, with 1*l.* 12s. per man per month for bread and forage—in all 150,000*l.* a-month; besides 300,000*l.* for putting them in motion, and 100,000*l.* more at the end of the year for sending back again: so that, instead of getting 100,000 men for 800,000*l.* per annum, as at first proposed, we had eventually to pay near 1,200,000*l.* for 62,400, for six months nominally, but not for one day in reality. The intention was to employ these troops on the Dutch frontier in connexion with our own army then in Flanders under the Duke of York; but it soon became clear that Lord Malmesbury had been again deceived, for the Prussians seem never to have had the remotest idea of executing any part of the treaty, except pocketing the money. The editor very naturally wishes to palliate this discomfiture of his grandfather; and—Lord Malmesbury having been invited to bring to England for the consideration of the ministers the opinion of the Duke of York and of the Dutch government, as to the best mode of employing the subsidiary army—the editor states,

"It appears that this *ill-judged* recall contributed much to the success with which the French party, taking advantage of treachery and national prejudices, contrived through Lucchesini to stultify the Treaty."—p. 93.

We cannot see how this recall was *ill-judged*, or what Lord Malmesbury's quitting the Hague for a visit to London of three weeks—after the treaty had been signed—could have had to do with French intrigues at Berlin or Lucchesini's negotiations at Vienna. When Lord Malmesbury returned to the Hague—he had been in London only from the 6th to the 24th of May—he was met by complaints from the Prussians that the money, without which their army *could* not move, had not yet come; and Malmesbury, in his Diary under date of the 2d of June, complains in very bitter terms against the English ministers that the first instalment under this prodigious treaty had not yet arrived, as if such sums as hundreds of thousands of pounds in a particular coin could be collected at a few day's notice. It turned out that the first instalment of 300,000*l.* had been already remitted from the British treasury on the 27th of May. For the few days that the remittance was on the road nothing could exceed the complaints of the Prussian ministers at the delay. The Prussian army could not and would not move a mile without the money, and Lord Malmesbury was very well inclined to join in all their prognostics of mischief from this supposed delay. In the midst of all these complaints the money arrived;—the complaints ceased—but not a Prussian marched. The monthly subsidies were to commence on a most appropriate and auspicious day—the *first of April*; and they were regularly paid in Prussian coin procured for the purpose; yet we find Lord

Malmesbury confessing that for these "*immense sums*," as he justly calls them, the Prussians had not moved a step;—not did they ever; but exaggerating the effects of a trifling skirmish which they had with the French near Keyserlautern, which even the exemplary modesty of the French military writers hardly notices, and complaining beyond all credibility and truth of their own loss, they at last got up a kind of mutiny in the army against a compliance with the treaty, and having received 1,105,000*l.* up to September, out of the gullibility of Lord Malmesbury and the too prodigal confidence of the British ministry, the whole bubble burst;—and then Lord Malmesbury writes home, with the most wonderful self-complacency, that he is not at all ashamed of the failure of his treaty, because it

"must be considered as an alliance with the *Algerines*, whom it is no disgrace to pay, nor any impeachment of good sense to be cheated by."—vol. iii., p. 126.

O lame, and impotent, and disgraceful conclusion! Instead of regarding Lord Malmesbury's temporary recall as injudicious, or the delay in paying the swindled subsidy as blamable, every one who reads *even* these papers will rather wonder at the blind confidence that the ministry reposed in him.

And here we have to observe, what we have already hinted at, the danger to historical truth of this sort of revelations—where we are not sure that the *whole* story is told. Mr. Pitt and Lord Grenville are seriously censured in *selections* from Lord Malmesbury's dispatches, and in a *note* by the editor: but in such a case we should have liked to see the *whole* dispatch, and the document on which the note is founded;—and above all, as regards the high praise given to Lord Malmesbury's diplomacy, would it not have been candid to have afforded us (what we have taken some pains to collect from other sources) an account of the sums actually paid to the Prussians under this boasted treaty, of which they on their side never performed—nor, we are satisfied, ever meant to perform—one iota? We confidently trust that with the change of our continental relations, the system of subsidies has vanished forever; but if any future minister should be tempted to deal in that vicarious species of warfare, we doubt whether he could have a better dissuasive than the study of the full history of Lord Malmesbury's treaty of 1794, and its profligate and disgraceful consequences. Of all the manifold errors committed in the revolutionary war, the most injurious to ourselves and even to our allies was the unhappy system of subsidies. We are surprised that Lord Malmesbury did not see this even at the time, for we find that at the close of this unlucky mission he gives Lord Grenville an alarming picture of the state of the public mind in Germany at that period, which ought to have opened his own eyes to the folly and mischief of the very efforts he was making.

"The nobility, the gentry, and large capitalists * * * attribute the evils of war and its duration, not to the enemy, who is endeavoring so strenuously to destroy them, but to the *very powers* who are endeavoring to rescue them from destruction * * * and it is impossible to awaken them to a sense of their danger.

"To every attempt of this kind which I have made, I receive for answer, '*England finds its account in the war, and only wants to engage us to continue from views of ambition and conquest.*'

"It is useless to argue against such miserable

reasoning, as it would be childish to resent it; but it is impossible not to be deeply affected when we see an immense country like this, *abounding at this moment with wealth, and possessing within itself alone means sufficient to resist and repel all the efforts of France*, poisoned with doctrines and prejudices which falsify all its faculties, and make those very powers which ought to ensure its safety act as instruments to forward its destruction.—pp. 142, 143."

What was more likely to accredit this imputation of selfish and dishonest motives than to see us squandering such enormous sums on countries themselves "*abounding with wealth and possessing within themselves alone means sufficient to resist and repel all the efforts of France?*" And what was more likely to palsy the feelings and exertions of such a country than the blind, demoralizing, and to their eyes most suspicious system of hiring them to do their own business, and bribing them to the protection of their own property and honor? Subsidies, alas, could not remedy, but, on the contrary, tended rather to increase and develop the real weakness of the continental powers, which was, as Lord Malmesbury was at length convinced—not want of the legitimate means of war, but—in their armies party, corruption, and disaffection—in the courts jealousies, animosities, and greedy speculations, and in that of Prussia treachery—in the people mysticism, infidelity and jacobinism—these were the causes that helped, if they did not altogether produce, the early successes of the French on the Rhine, and eventually, by a signal course of retributive justice, brought them, twice over, to Berlin and Vienna.

We now arrive at that portion of these volumes about the propriety of the publication of which we entertain on every account the most serious doubts—a very copious and unreserved diary kept by Lord Malmesbury during his mission to the court of Brunswick at the close of 1794, to demand the Princess Caroline in marriage for the Prince of Wales, and to conduct her to England. We confess that no publication that we have ever seen (and we have recently seen some of very doubtful discretion) has surprised us more than this. The protection of the law against unauthorized publication is not, as we have seen, limited to *letters*—it applies to *all cases where the publication would amount to a violation of trust and confidence*, or where it should be made for the purpose of indulging a gross and diseased public curiosity by the circulation of *private anecdotes, or family secrets, or personal concerns* (*ubi supra*, § 948.) Now there is not a fact—hardly a word—in this diary that does not relate to *private anecdotes, family secrets, and personal concerns*—all arising out of and belonging to the mission—nothing that was not done or said by or to Lord Malmesbury in his *official character*. In this character he received the most important and delicate confidences, both personal and political; and we cannot conceive how he or his representative could acquire any right to divulge—much less to print and publish to the whole world—informations given to him under a seal as sacred, we think, as that of *confession*. If ever there was a case in which the crown had a paramount interest in documents written by its public servants, it is especially such a one as this, where the sovereign is interested not only by her royal rights, but as the head of the family whose domestic affairs are here divulged, and as connected with the persons principally concerned by the highest

obligations of duty and the closest ties of blood. And in addition to the general question of *right*, one cannot help being struck, on the first view of this case, by manifest breaches of delicacy and good taste. The parties to that unfortunate alliance have left a numerous and illustrious kindred (to say nothing of private friends and servants) still living, whose feelings cannot but be painfully affected by some of Lord Malmesbury's revelations—which seem indeed to compromise his lordship's own character, for many of the memoranda are such as a gentleman, if obliged by his duty to make them, ought to have destroyed before his death, or at least taken effectual measures for their subsequent destruction.

This cannot be denied, and must be regretted; but on the other hand it would be unjust not to suggest, in excuse for the noble editor, that revelations of an infinitely more deplorable character had been five-and-twenty years ago paraded and produced in the most flagrant publicity by the parties themselves—they are registered in our archives, they are engraven on the tablets of our history. Lord Malmesbury's anecdotes are but the light clouds that presaged that dark storm, and the editor probably thought that the pain that they can excite in any mind that recollects the proceedings of 1790, must be of a very mitigated degree. But whatever may be thought of the act of publication, the facts are now *history*, and we must deal with them accordingly.

It was at the conclusion of the subsidiary mission to Prussia that Lord Malmesbury was commissioned to take Brunswick in his way home, and to conclude another treaty still more deplorable in its consequences. Before we enter on that business, we must introduce our readers to the Duke and Duchess of Brunswick. His highness, in disgust at the untoward result of his unfortunate campaigns of 1792-3, had resigned the command of the Prussian army, and was living at home a mortified and alarmed spectator of the great military and political game then playing, in which, though he no longer held a hand, his all was at stake. It was a secondary object of Lord Malmesbury's mission to prevail on the duke to take some measures for re-assuming the command of the Prussian army, or, if that could not be accomplished, to take the command of the Dutch army, and to act in concert with the Duke of York. The Duke of Brunswick had not, we believe, the option of doing the first, and he would not do the latter; and Lord Malmesbury, while admitting his talents and courage, pronounces him, from his wavering, suspicious, intriguing temper, utterly unfit for any great station, and incapable of any great service. This may have been, and was, we think, his general character; but we believe that the duke did not deserve his lordship's reproaches, in the particular case which produced them. He was a marshal in the Prussian army; situated as his duchy was, he had no support but Prussia; and though his strong inclination was to active exertions against France, he said that he could not safely take command of any army but a Prussian one, or at least one to which a large Prussian force should be attached. It was very well for Lord Malmesbury, who had a safe retreat in England, to make light of the duke's difficulties; but the result justified, we think, all that prince's apprehensions; and we feel not contempt, but sympathy, for the perplexity of a brave soldier and benevolent sovereign—resisting the impulses of

his own personal gallantry and political opinions, under the humiliating certainty of the ruin that a false step would entail on his family and his people. We are, however, inclined to believe that he was deficient in decision and moral courage, and of this defect the following anecdote, with regard to his too celebrated manifesto, is a slight but sufficient indication.

"Dec. 10th, 1794.—He [the Duke of Brunswick] was less *thinking* this day than usual" [poor man, he had abundant cause to be *thoughtful*]; "he was conversable with the ladies at dinner—said that his famous Manifesto was drawn up by a *Brabançon* of the name of Himon* (now here;) that it was approved by Count Schullenburg and Spielman, and forced upon him to sign; that he had not even a *veto* on this occasion."—p. 169.

The fact is true; but to have signed what he disapproved, and afterwards to throw the blame on other parties, showed but a feeble character; and Lord Malmesbury states that the duchess herself was convinced that he wanted firmness for the crisis.

"Dec. 1st.—The duchess told me she was sure he [the duke] felt himself unequal to it [the command of the army]—that he was grown nervous, and had lost a great deal of his former energy.—She said, when he returned from Holland in 1787, he was so shaken, and his nerves so worn out, that he did not recover for a long time. She confirmed what I long since knew, that the duke wants decision of character, and resolution."—p. 161.

The duchess was probably desired by the duke himself to express this opinion, for the purpose of damping Lord Malmesbury's solicitations; but even that would have been the resource of a feeble mind. He, however, was a good prince—an honest man—a benevolent sovereign—and so sincere in his hostility to French influences that Bonaparte in his 16th Bulletin, 1806, charged the whole resistance of Prussia to his advice; and he died, in every way a victim to his patriotism, on the 10th of November, of wounds received in the

* This is a mistake for the Marquis de Limon—another of the too numerous and inexcusable errors of the press which disgrace this publication. We made the same observation on the former series, and produced a few instances, which we find given in a fly-leaf to this livraison as "*errata*" to the former volumes—two only being added to our list, though there might have been two score. But the blunders of the present publication are infinitely worse, particularly in all proper names, which are so mutilated as to be, in many cases, quite unintelligible; and prove that the printed sheets cannot have been seen by any one at all acquainted with the persons or occurrences referred to—*Cragga*, for *Craig*; *Armin*, for *Arnim*; *W. Eden*, for *Morton Eden*; *W. Boothby*, for *Brook Boothby*; *Gensau*, for *Gneisenau*; *Kalkreuther*, and *Kalkreuthen*, for *Kalkreuth*; *St. Armand*, for *St. Amand*; *Fleury*, for *Fleurus*; *Colegrave*, for *Cologne*; *montebaner*, for *Montabauer*; *Fühl*, and *Pfühl*, and *Tuhl*, for the same person; *Benden*, for *Bender*; *Pigot Monbailard*, for *Pigault-Maubailacq*; *Maco*, perhaps for *Maret*; *Boncarrier*, probably for *Bonne Carrere*; *Sausun*, for *Lauzun*; *Grenville*, for *Granville*; *Moussen*, for *Mousseaux*; *Cabarras passim*, for *Cabarus*; *Fabre Eglon*, for *Fabre d'Eglantine*; *Ladies Moira* and *Hutchinson* for *Lords*; *Asperno passim*, for *Asperne*; *Dantzic* for *Dunkirk*; *Melville*, for *Moleville*; and fifty others. Most of these seem, when explained, to be small matters, easily set right; but we are not quite sure that we have always guessed the right name; and unless one is tolerably well acquainted with the personal history of everybody that Lord Malmesbury has happened to have mentioned, there is no certainty as to who or what may be meant.

fatal battle of Jena, when the dukedom of Brunswick and the kingdom of Prussia fell together.

The duchess was the elder sister of King George III.; and after the death of her husband and the ruin of her house, returned, in July, 1807, to England, where she died on the 23d of March, 1813, in her seventy-sixth year. She will be longest familiar to English eyes by her graceful figure as a girl of fifteen in the poorly painted but very interesting picture by Knapton, at Hampton Court, of the family of Frederick, Prince of Wales. She seems to have been a most good-humored, unaffected, gossiping lady; and, whatever good example she may have given her daughter in moral conduct, appears not to have afforded her, either by precept or example, much instruction in manners, discretion, dignity, or even in the more ordinary and superficial properties of feminine deportment. We shall see that Lord Malmesbury soon found himself invested with the strange duty of instructing the young lady, not only on points of behavior and of moral and religious conduct, but even on certain arcana of her personal toilet—upon which never before, we suppose, had an ambassador, or even a male, been called upon to advise: and it appears to us that in this new and unexpected trial of his good temper and good sense, Lord Malmesbury conducted himself with consummate tact and ability. He played the part of—as she herself good-humoredly called it—“*Mentor*” to the young princess admirably; but would forfeit all the merit, if we could believe that he ever meant that it should be thus blazoned forth.

But it was not for neglect and bad taste in her daughter's education that the good-humored but narrow-minded duchess was alone blamable—she had given her wrong impressions on some most important subjects. She had, it seems, before her marriage, (as sisters-in-law are sometimes apt to do,) taken a foolish dislike to Queen Charlotte, and had impressed her daughter with the same unreasonable and, as far as the grounds are stated, ridiculous prejudices; and the same may be said of a similar antipathy against the Duke and Duchess of York. The real but unavowed cause of this dislike was, we believe, a fact—not publicly known, but which we have heard from indisputable authority, and with which the old duchess was probably then acquainted—that the Duke of York was unfavorable to this match, auguring, from his knowledge of the parties, very ill of it from the beginning; and it is probable that he may have communicated to the queen, his mother, something of his early impression. But, however that may be, her majesty's conduct to her daughter-in-law was, like every other circumstance of her life, admirable; and, strange vicissitude, both the mother and the daughter were destined within a few years to rely in their deep distresses on the tenderness and justice of her against whom they had nourished such unfounded prejudices.

We shall now allow Lord Malmesbury to introduce the princess to our readers, and to tell the rest of this strange story in the familiar style of his own unpremeditated—and we must presume un mutilated—diary.

“*Nov. 28th, 1794.*—The Princess Caroline much embarrassed on my first being presented to her—pretty face—not expressive of softness—her figure not graceful—fine eyes—good hand—tolerable teeth, but going—fair hair and light eyebrows,

good bust—short, with what the French call ‘*des épaules impertinentes.*’ *Vastly happy with her future expectations.*”—p. 153.

“*Dec. 3rd.*—Day fixed for my audiences. Major Hislop and a messenger arrive at eleven from the Prince of Wales. He brings the prince's picture, and a letter from him to me, urging me *vehemently* to set out with the Princess Caroline *immediately*.—Duke answers very well—rather embarrassed.—Duchess overcome, in tears.—Princess Caroline, much affected, but replies distinctly and well.”—pp. 161, 162.

“*Dec. 4th.*—Very much puzzled how to decide about going [to England] duchess presses it—duke cautious to a ridiculous degree in assisting me. Princess Caroline in a hurry. Prince of Wales [eager] wishes in flat contradiction to my instructions.”—p. 163.

“*Dec. 5th.*—After dinner the duke held a very long and very sensible discourse with me about the Princess Caroline. He entered fully into her future situation—was perfectly aware of the character of the prince, and of the inconveniences that would result, almost with equal ill effect, either from his liking the princess too much or too little. He said of his daughter, ‘*Elle n'est pas bête, mais elle n'a pas de jugement—elle a été élevée sévèrement, et il le falloit.*’ The duke desired me to advise her never to show any jealousy of the prince; and, if he had any *goûts*, not to notice them. He said he had written her all this in *German*, but that enforced by me, it would come with double effect.”—p. 164.

The duke's laxity as to the *goûts* of his future son-in-law, and his *severity* towards his daughter, are not surprising when we find the scenes in the midst of which the princess lived. Very brilliant and prominent in the duchess's court and society, Lord Malmesbury found—

“*Nov. 22nd, 1794.*—Madlle. de Hertzfeldt—old Berlin acquaintance—*now duke's mistress*—much altered, but still clever and agreeable—her apartment elegantly furnished—and she herself with all the *appareil* of her situation—she was at first rather ashamed to see me, but soon got over it.”—pp. 155, 156.

And from this lady he received accounts of the princess' character, not very favorable, though apparently sincere and well meant; but she seems not to have thought—nor indeed does Lord Malmesbury—of the injurious effect that her own example, and that of a general laxity of manners, must have had on the princess—but in which it is impossible not to see the seeds and the hotbed of future imprudence.

“*Dec. 5th, 1794.*—Dinner at Court—ball and ombre. Madlle. Hertzfeldt repeats to me what the duke had before said—stated the necessity of being very *strict* with the Princess Caroline—that she was not clever, or ill-disposed, but of a temper easily wrought on, and had *no tact*.”—p. 165.

“*Dec. 10th.*—Concert at Court—Madlle. Hertzfeldt takes me aside, and says nearly these words: ‘*Je vous conjure, faites que le prince fasse mener, au commencement, une vie retirée à la princesse. Elle a toujours été très gênée et très observée, et il le falloit ainsi. Si elle se trouve tout à coup dans le monde sans restriction aucune, elle ne marchera pas à pas égaux. Elle n'a pas le cœur dépravé—elle n'a jamais rien fait de mauvais, mais la parole en elle devance toujours la pensée; elle se livre à ceux à qui elle parle sans réserve, et de là il s'ensuit (même dans cette petite Cour) qu'on lui prête des*

sens et des intentions qui ne lui ont jamais appartenu—que ne sera-t-il pas en Angleterre—où elle sera entourée de femmes adroites et intrigantes (à ce qu'on dit) auxquelles elle se livrera à corps perdu (si le prince permet qu'elle mène la vie dissipée de Londres,) et qui placeront dans sa bouche tel propos qu'elles voudront, puisqu'elle parlera elle-même sans savoir ce qu'elle dit? De plus elle a beaucoup de vanité, et quoique pas sans esprit, avec peu de fond—la tête lui tournera si on la caresse et la flatte trop—si le prince la gêne; et il est tout aussi essentiel qu'elle le craigne que qu'elle l'aime. Il faut absolument qu'il la tienne serrée, qu'il se fasse respecter, sans quoi elle s'égarera. Je sais (continua-t-elle) que vous ne me compromettrez pas, je vous parle comme à mon vieux ami. Je suis attachée cœur et âme au Duc. Je me suis dévouée à lui, je me suis perdue pour lui. C'est le bien de sa famille que je veux. Il sera le plus malheureux des hommes si cette fille ne réussit pas mieux que son aînée. Je vous répète, elle n'a jamais rien fait de mauvais, mais elle est sans jugement et on l'a jugée à l'avenant. Je crains (dit Madlle. Hertzfeldt) la Reine. La duchesse ici, qui passe sa vie à penser tout haut, ou à ne jamais penser du tout, n'aime pas la Reine, et elle en a trop parlé à sa fille. Cependant son bonheur dépend d'être bien avec elle, et pour Dieu répétez-lui toujours cette maxime que vous avez déjà plus d'une fois recommandée. Elle vous écoute. Elle trouve que vous parlez raison d'une manière gaie, et vous ferez bien plus d'impression sur elle que son père, qu'elle craint trop, ou sa mère, qu'elle ne craint pas du tout."—pp. 169, 170.

"Dec. 28th.—Madlle. Hertzfeldt again talks to me as before about the Princess Caroline—'Il faut la gouverner par la peur, par la terreur même. Elle s'émancipera si on n'y prend pas garde—mais si on la veille soigneusement et sévèrement elle se conduira bien.' The King of England, in a letter to the duchess, says, 'Qu'il espère que sa nièce n'aura pas trop de vivacité, et qu'elle mènera une vie sédentaire et retirée.' These words shock Princess Caroline, to whom the duchess very foolishly reads the letter."—p. 189.

Madlle. de Hertzfeldt seems to have been a sensible woman, though in a very awkward position; and these were ominous confidences; and although Lord Malmesbury was at first disposed to hope that they might be exaggerated, it is plain that he every day became less and less sanguine as to the result of the alliance:—

"Dec. 10th, 1794. Masquerade—I walked with the Princess Caroline, and had a very long conversation with her. I endeavored not to mix up much serious matter at such a place, but whenever I found her inclined to give way too much to the temper of the entertainment, and to get over cheerful and too mixing, I endeavored to bring her back by becoming serious and respectful.

"She entered of her own accord, into the kind of life she was to lead in England, and was very inquisitive about it. I said it would depend very much on her; that I could have no share in settling it, but that my wish was, that in private she might enjoy every ease and comfort belonging to domestic happiness, but that when she appeared abroad, she should always appear as Princess of Wales, surrounded by all that 'appareil and etiquette' due to her elevated situation. She asked me what were the queen's drawing-room days! I said, Thursday and Sunday after church, which

the king and queen never missed; and I added that I hoped most ardently she would follow their example, and never, on any account, miss divine service on that day. 'Does the prince go to church?' she asked me. I replied, she would make him go; it was one of many advantages he would derive from changing his situation. 'But if he does not like it?' 'Why, then your Royal Highness must go without him, and tell him that the fulfilling regularly and exactly this duty can alone enable you to perform exactly and regularly those you owe him—this cannot but please him, and will, in the end, induce him also to go to church.' The princess said mine was a very serious remark for a masquerade. I begged her pardon, and said it was, in fact, a more cheerful one than the most dissipated one I could have made, since it contained nothing *triste* in itself, and would infallibly lead to everything that was pleasant. She caught my idea with great quickness, and the last part of our conversation was very satisfactory, as I felt I had done what I wished, and set her mind on thinking of the *drawbacks* of her situation, as well as of its 'agréments,' and impressed it with the idea that, in the order of society, those of a very high rank have a price to pay for it, and that the life of a Princess of Wales is not to be one of all pleasure, dissipation, and enjoyment; that the great and conspicuous advantages belonging to it must necessarily be purchased by considerable sacrifices, and can only be preserved and kept up by a continual repetition of these sacrifices."—pp. 170, 171.

"Dec. 16th.—At dinner next Princess Caroline; she says it is wished here that her brother William should marry the Princess Sophia of Gloucester; I advise her not to meddle in it. She talks about the Duke of Clarence, whom she prefers to the Duke of York, and it struck me to-day for the first time that he originally put her into the prince's head, and that with a view to plague the Duke and Duchess of York, whom he hates, and whom the prince no longer likes; well knowing that the Princess Caroline and Duchess of York dislike each other, and that this match would be particularly unpleasant to her and the duke. I praise the Duke of York to her, and speak with great applause of the behavior of the duchess, who by her discretion and conduct has conciliated to herself the good-will of the whole nation. I did this to pique her, and to make her anxious to do the same.—She has no *fond*, no fixed character, a light and flighty mind, but meaning well and well-disposed; and my eternal theme to her is, to think before she speaks, to recollect herself. She says she wishes to be loved by the people; this, I assure her, can only be obtained by making herself respected and rare—that the sentiment of being loved by the people is a mistaken one—that sentiment can only be given to a few, to a narrow circle of those we see every day—that a nation at large can only respect and honor a great princess, and it is, in fact, these feelings, that are falsely denominated the love of a nation; they are not to be procured, as the good-will of individuals is, by pleasant openness and free communication, but by a strict attention to appearances—by never going below the high rank in which a princess is placed, either in language or manners—by mixing dignity with affability, which, without it, becomes familiarity, and levels all distinction."—pp. 179, 180.

These extracts do infinite credit to Lord Malmes-

bury's good sense and good taste: but his advice was sadly counteracted. There was at court a sister of the duke's, the Princess Augusta, who bore a title that sounds as farcical as her conduct and character seem to have been—she was the Abbess of *Gandersheim*. Lord Malmesbury had formerly known her—an advantage he would now have willingly forgotten, for she not only honored him with recollections of a supposed attachment in their younger days, but (if we understand his lordship rightly) she was not unwilling, in spite of her age and ecclesiastical dignity, to have renewed it. This lady of *Gandersheim* seems to have thought it necessary to school her niece against the immoral propensities of all mankind—nay, against the possible designs of the ambassador himself—in a style which the princess, if she had been well brought up, would hardly have listened to even from an aunt, and still less repeated to the object of such strange suspicions.

“*Dec. 18th, 1794.*—At supper Princess Caroline tells me of a kind of admonitory conversation the *abbesse* had held to her—it went to exhort her to trust not *in men*, that they were not to be depended on, and that the prince would certainly deceive her, &c., and all the nonsense of an envious and *desiring* old maid. The princess was made uneasy by this, particularly as her aunt added that she was sure she would not be happy.”—p. 181.

“*Dec. 21st.*—She talked of her aunt the *abbess*—said she had endeavored to inspire her with a diffidence and mistrust of *me*—had represented me as *un homme dangereux*. I tried to get rid of this sort of conversation, but the princess stuck by it, and I was forced to say that I believed her aunt had forgotten that twenty years had elapsed since she had seen me, or heard of me; and that, besides, such an insinuation was a tacit accusation of my being very *foolishly* unprincipled. She said she meant well, that she perhaps thought too partially of me herself, and was afraid for her. It was in vain to attempt to turn the subject—she went on during the whole supper—was in high spirits, and laughed unmercifully at her aunt, and her supposed partiality for me.”—p. 183, 184. But we find that these and similar communications brought very strange prospects into the poor princess' view:—

“*Dec. 28th, 1794.*—Princess Caroline shows me the anonymous letter about Lady —, evidently written by some disappointed milliner or angry maid-servant, and deserving no attention; I am surprised the duke afforded it any. Aimed at Lady —; its object to frighten the princess with the idea that she would *lead her into AN AFFAIR OF GALLANTRY*, and be ready to be *convenient* on such an occasion. This did *not* frighten the princess, although it did the duke and duchess; and on my perceiving this, I told her Lady — would be more cautious than to risk such an audacious measure; and that, besides, it was *death* to presume to approach a Princess of Wales, and no man would be daring enough to think of it. *She asked me whether I was in earnest.* I said such was our law; that any body who presumed to *love* her was guilty of *high treason*, and punished with *death*: if she was weak enough to listen to him—so also would she. *This startled her.*”—p. 189. These were strange conversations—so strange that Lord Malmesbury confesses with a serious kind of pleasantry that he himself was treated with so much personal kindness by the princess, that the case of “*the Duke of Suffolk and Queen Margaret*” came across his thoughts.

The treaty of marriage was soon concluded, but Lord Malmesbury was in great doubt how to convey his precious charge to England. It had been at first arranged that they were to go through Holland, and they departed from Brunswick with that hope on the 29th of December; but the irruption of the French into Holland frustrated that intention, and forced Lord Malmesbury, after having advanced two stages beyond Benthaim, to retrograde to Osnabruck and Hanover; and it was not till the 5th of April that they arrived in London.

The duchess, at Lord Malmesbury's pressing instances, was to accompany her daughter to the sea-side, and to deliver her into the hands of the ladies appointed to attend her. In consequence of this unexpected and vexatious delay, the duchess was exceedingly anxious to get back to her own capital, only a few leagues off, and to leave her daughter—(who being now Princess of Wales, could not well reappear at Brunswick)—in the sole guardianship of Lord Malmesbury; but he, with great propriety and firmness, resisted the proposition, and forced the duchess, to her great dissatisfaction, to remain with her daughter.

We shall extract some of the many remarkable particulars that occurred during the journey:—

“*Jan. 9, 1795.*—Leave Benthaim at seven—Delden at twelve; about four leagues further on, meet letters from Lord St. Helen's [then our minister in Holland,] saying the French had passed the Waal—that they were near Baren, and that there had been fighting all day: he recommends our turning back. I mentioned this to the princesses, and I must in justice say that the Princess Caroline bore this disappointment with more good temper, good humor, and patience, than could be expected, particularly as she felt it very much.

* * * A heavy cannonade was heard all night at no great distance. The princess in the morning seemed sorry not to go on towards the fleet. I mentioned this cannonade. ‘*Cela ne fait rien,*’ says she, ‘*je n’ai pas peur des canons.*’—‘*Mais, Madame, le danger d’être pris.*’ ‘*Vous ne m’y exposerez pas,*’ said she. I told her the story of the Queen of France (St. Louis' wife) during the siege of Damiette, and *Le Sieur de Joinville*—I said, ‘*Qu’elle valoit mieux que celle-là que les François seroient pires que les Sarrazins, et que moi j’ai pensé comme le Chevalier.*’* The story pleased. ‘*J’aurois fait et désiré comme elle,*’ said she.”—vol. iii., pp. 194, 195.

Jan. 2.—I persuade the Princess Caroline to be munificent towards some poor *Emigrés* dying of hunger, and through want—she disposed to be, but not knowing *how* to set about it. I tell her, liberality and generosity is an enjoyment, not a severe virtue. She gives a louis for some lottery tickets—I give ten, and say the princess ordered me—she surprised; I said I was sure she did not mean to give for the ticket its *precise* value, and that I forestalled her intention. Next day a French *émigré*, with a pretty child, draws near the table—the Princess Caroline *immediately*, of her own

* After the capture of St. Louis, his queen, Margaret, who was besieged in Damiette, being on the point of lying-in, was in a constant panic, and imagining every possible outrage from the barbarians, she extorted an oath (not from Joinville, as Lord Malmesbury states—Joinville only tells the story—but) from “*un Chevalier viel et ancien de l’age de quatre-vingtz ans et plus*” who guarded her bed, to grant her one request—that if the Saracens should take the place he would save her from insult by putting her to death. “*I was thinking of it,*” replied the *viel Chevalier*.

accord, puts ten louis in a paper, and gives it to the child; the duchess observes it, and inquires of me (I was dining between them) what it was. I tell her a *demand on her purse*. She embarrassed—'Je n'ai que mes beaux doubles louis de Brunswick.' I answer, 'Qu'ils deviendront plus beaux entre les mains de cet enfant que dans sa poche.' She is ashamed, and gives three of them. In the evening, Princess Caroline, to whom these sort of virtues were never preached, on my praising the coin of the money at Brunswick, offers me very seriously eight or ten double louis, saying, 'Cela ne me fait rien—je ne m'en soucie pas—je vous prie de les prendre.' I mention these facts to show her character; it could not distinguish between *giving* as a benevolence, and flinging away the money like a child. She thought that the act of getting rid of the money, and not seeming to care about it, constituted the merit. I took an opportunity at supper of defining to her what real benevolence was, and I recommended it to her as a quality that would, if rightly employed, make her more admirers, and give her more true satisfaction, than any that human nature could possess. The idea was, I was sorry to see, new to her, but she felt the truth of it; and she certainly is not fond of money, which both her parents are.

"Jan. 4.—Princess Caroline very *gauche* at cards—speaks without thinking—gets too easy—calls the ladies (she never saw) 'Mon cœur, ma chère, ma petite.' I notice this, and reprove it strongly. The princess, for the first time, disposed to take it amiss; I do not pretend to observe it. Duchess wants to return to Brunswick, and leave us to go on by ourselves; this I oppose, and suppose it impossible. 'If I am taken,' says she, 'I am sure the king will be angry.'—'He will be very sorry,' I reply; 'but your Royal Highness must not leave your daughter till she is in the hands of her-attendants.' She argues, but I will not give way, and she does."—vol. iii., pp. 192, 193.

"Jan. 18.—Princess Caroline very *missish* at supper. I much fear these habits are irrevocably rooted in her—she is naturally curious, and a gossip—she is quick and observing, and she has a silly pride of finding out everything—she thinks herself particularly acute in discovering *likings*, and this leads her at times to the most improper remarks and conversation.—I am determined to take an opportunity of correcting her, *coûte qu'il coûte*."—vol. iii., p. 200.

"Jan. 10, 1795.—On summing up Princess Caroline's character to-day, it came out to my mind to be, that she has quick parts, without a sound or distinguishing understanding; that she has a ready conception, but no judgment; caught by the first impression, led by the first impulse; turned away by appearances or *enjouement*; loving to talk, and prone to confide and make *missish* friendships that last twenty-four hours. Some natural, but no acquired morality, and no strong innate notions of its value and necessity; warm feelings and nothing to counterbalance them; great good humor and much good nature—no appearance of caprice—rather quick and *vive*, but not a grain of rancor. From her habits, from the life she was allowed and even compelled to live, forced to dissemble; fond of gossiping, and this strengthened greatly by the example of her good mother, who is all curiosity and inquisitiveness, and who has no notion of not gratifying this desire at any price. In short, the princess in the hands of a steady and sensible man would probably turn

out well, but where it is likely she will find faults perfectly analogous to her own, she will fail. She has no governing powers, although her mind is *physically* strong. She has her father's courage, but it is to her (as to him) of no avail. *He* wants mental decision; *she* character and *tact*."—vol. iii., pp. 196, 197.

"Jan. 23.—I have a long and serious conversation with the princess about her conduct at Hanover, about the prince, about herself and her character. She much disposed to listen to me, and to take nothing wrong. I tell her, and I tell her truly, that the impression she gives at Hanover will be that on which she will be received by the king and queen in England. I recommend great attention and reserve. That the habit of *proper, princely* behavior was natural to her; that it would come of itself; that acquired by this (in that respect) fortunate delay in our journey, it would belong to her, and be familiar to her on her coming to England, where it would be of infinite advantage. She expresses uneasiness about the prince; talked of his being *unlike*, quite opposite to the king and queen in his *ideas and habits*; [I replied] that he had contracted them from the *vueide* in his situation; that she was made to fill this up; she would domesticate him—give him a relish for all the private and home virtues; that he would then be happier than ever; that the nation expected this at her hands; that *I knew* she was capable of doing, and that she would do it.—She hesitated.—I said, that I had seen enough of her to be quite sure her mind and understanding were equal to any exertions; that therefore, if she did not do *quite* right, and come up to *everything* that was expected from her, she would have no excuse. I added, I was so sure of this, that it would be the *first* thing I should tell the *king and queen*, and that therefore she must be prepared; that they would know her as well, and judge her as favorably, and at the same time as *severely* as I did. I saw this had the effect I meant; it put a curb on her desire of amusement; a drawback on her situation, and made her feel that it was not to be all one of roses. She ended on retiring by saying, she hoped the prince would let her see me, since she never could expect any one would give her such good and such free advice as myself; and, added she, 'I confess I could not bear it from any one but you.'"—vol. iii., pp. 203, 204.

This protracted interval of domesticity with the princess brought to Lord Malmesbury's notice another defect of a strange and unexpected kind, which must have reached a very unusual height before he would have perceived it or felt himself justified in interfering even by the most distant allusion:—

"Feb. 18.—Argument with the princess about her toilette. She piques herself on dressing quick; I disapprove this. She maintains her point; I however desire Madame Busche to explain to her that *the prince is very delicate*, and that he expects a long and very careful *toilette de propreté*, of which she has no idea. On the contrary, *she neglects* it sadly, and is *offensive from this neglect*. Madame Busche executes her commission well, and the princess comes out the next day well washed *all over*."—vol. iii., pp. 207, 208.

This extraordinary paragraph explains a main incident in the catastrophe, at which we shall arrive presently, and which, but for the word "*offensive*" in the foregoing extract, would appear, we believe, to every reader perfectly unaccountable.

But it seems that this, in every sense of the word, wholesome lesson made, as Lord Malmesbury laments that most of his lessons did, only a momentary impression, for in about three weeks he found himself obliged to resume a subject which nothing but the last necessity could have induced him to approach:—

“March 6.—I had conversations with the Princess Caroline, on the *toilette*, on *cleanliness*, and on *delicacy* of speaking. On these points I endeavored, as far as was possible for a *man*, to inculcate the necessity of great and nice attention to every part of dress, as well as to what was hid as to what was seen. (I knew she wore coarse petticoats, coarse shifts, and thread stockings, and these never well washed, or changed often enough.) I observed that a long *toilette* was necessary, and gave her no credit for boasting that hers was a ‘short’ one. What I could not say myself on this point I got said through women; through Madame Busche, and afterwards through Mrs. Harcourt. It is remarkable how amazingly on this point her education has been neglected, and how much her mother, although an Englishwoman, was inattentive to it.”—vol. iii., pp. 211, 212.

At last, on the 28th of March, they embarked on board the *Jupiter*, Commodore Payne, and, accompanied by a small squadron, arrived in the Thames on the 4th of April, after a smooth and beautiful passage (delusive omen!)—they reached St. James’ Palace about two o’clock—and in *five minutes* the first step in a long series of scandal and misery was suddenly and irretrievably made:—

“April 5.—I immediately notified the arrival to the King and Prince of Wales; the last came immediately. I, according to the established etiquette, introduced (no one else being in the room) the Princess Caroline to him. She very properly, in consequence of my saying to her it was the right mode of proceeding, attempted to kneel to him. He raised her, (gracefully enough,) and embraced her, said barely one word, turned round, retired to a distant part of the apartment, and calling me to him, said, ‘Harris, I am not well; pray get me a glass of brandy.’ I said, ‘Sir, had you not better have a glass of water!’—upon which he, much out of humor, said, with an oath, ‘No: I will go directly to the queen;’ and away he went. The princess, left during this short moment alone, was in a state of astonishment; and, on my joining her, said, “*Mon Dieu! est-ce que le Prince est toujours comme cela? Je le trouve très gros, et nullement aussi beau que son portrait.*” I said his royal highness was naturally a good deal affected and flurried at this first interview, but she certainly would find him different at dinner. She was disposed to farther criticisms on this occasion, which would have embarrassed me very much to answer, if luckily the king had not ordered me to attend him.”—vol. iii., p. 218.

Of this extraordinary scene, supposing as we are bound to do, that Lord Malmesbury has accurately stated the facts, and that there has been no suppression, we can imagine no explanation but that to which we have already alluded. During the delay that had occurred on the journey, the prince had shown all the impatience and *empressement* that could be flattering to the princess—the only letter of his given in the correspondence is written in a style of perfect delicacy and good sense.

“*Carlton House, Nov. 23, 1794.*”

“My dear Lord—I have sent Major Hislop back again to Brunswick, which I judged to be an advisable measure on many accounts, as more particularly, I think, he may prove, from his knowledge of the country, a very useful *avant courier* to you and your fair charge in your journey to the water’s side. I have charged him with letters for the duke, duchess, and princess, which I will beg of you to present to their different destinations, with every proper expression on my part, and to which no one can give so agreeable a *tour-nure* as yourself. I have likewise desired Major Hislop to give you an ample and thorough account of the steps I have taken towards the expediting everything on this side of the water, as well as with my brother the Duke of York, to whom I have written also by Hislop; and as to what is now necessary to forward the completing everything at Brunswick, I must leave that to you, hoping that you will make every exertion possible to *put the princess in possession of her own home* as near the 20th of the ensuing month as possible,” &c., &c.—vol. iii., pp. 221, 222.

And so on.—We see too that he hastened to the princess on her arrival with becoming eagerness, and received her at the first moment with propriety and grace. What was there to change so suddenly all these good feelings at the first embrace?

From that mysterious moment the affair seems to have been desperate. Lord Malmesbury proceeds,—

“The drawing-room was just over. His majesty’s conversation turned wholly on Prussian and French politics, and the only question about the princess was, ‘Is she good-humored?’ I said, and very truly, that in very trying moments, I had never seen her otherwise. The king said, ‘I am glad of it;’ and it was manifest, from his silence, he had seen the queen *since* she had seen the prince, and that the prince had made a very unfavorable report of the princess to her. At dinner, at which all those who attended the princess from Greenwich assisted, and the honors of which were done by Lord Stopford as Vice-Chamberlain, I was far from satisfied with the princess’ behavior; it was sippant, rattling, affecting raillery and wit, and throwing out coarse vulgar hints about Lady —, who was present, and though mute, *le diable n’en perdait rien*. The prince was evidently disgusted, and this *unfortunate dinner* fixed his dislike, which, when left to herself, the princess had not the talent to remove; but, by still observing the same giddy manners and attempts at cleverness and coarse sarcasm, increased it till it became positive hatred.*

“From this time, though I dined frequently during the first three weeks after the marriage at Carlton House, nothing material occurred, but the sum of what I saw there led me to draw the inferences I have just expressed. After one of these dinners, where the Prince of Orange was present, and at which the princess had behaved very lightly, and even improperly, the prince took me into his closet, and asked me how I liked this sort of manners; I could not conceal my disapprobation of

* We perceive that with a well-meant duplicity, Lord Malmesbury gave his friends a more favorable report of the matter than the facts warranted. He writes on the 10th of April to Mr. Crawford—“*The marriage was celebrated on Wednesday, and if they go on as well as they have begun, all will do well.*”—iii., 234. Alas! they did go on as they had begun, and all went ill.

them, and took this opportunity of repeating to him the substance of what the Duke of Brunswick had so often said to me, that it was expedient *de la tenir serrée*; that she had been brought up very strictly, and if she was not strictly kept, would, from high spirits and little thought, certainly emancipate too much. To this the prince said, 'I see it but too plainly; but why, Harris, did not you tell me so before, or write it to me from Brunswick?'—vol. iii., p. 219.

Lord Malmesbury replied—and the editor elsewhere repeats—that he was sent to *contract* the marriage and not to *advise* upon it, and that if he had advised upon it, it would only have been to the king; but that in fact there was nothing in what the Duke of Brunswick had said to affect either the princess' moral character or conduct. These reasons were perhaps a sufficient answer to the prince's expostulation—particularly as we must admit the extraordinary difficulty of Lord Malmesbury's situation. He had become acquainted with the less favorable details about the princess after the treaty of marriage was concluded; and in fact from the first day of his appearance there was no power of retrocession. But we must add, in further justice to Lord Malmesbury, that we are satisfied he could have told the prince nothing as to "moral character or conduct" that he did not already know, for we are assured that before the match was at all advanced, the prince was apprised by a near relative and friend of many circumstances that were likely to render the alliance an unsatisfactory, if not an unhappy one. So that he had no one to blame but himself. We are sorry to be obliged to add, that it seems as if his chief object in marrying was to get his debts paid; and acting on so low a principle, he was very likely to take, on very slight and inadequate grounds, a personal disgust. The disgust certainly existed—but we see that before any such feeling could have been excited, the inexcusable indecency of placing in the first attendance on the princess the very last lady in England who ought to have been brought to her notice, had been already committed—an outrage in every way so offensive as to be in the eyes of the world—certainly not a justification, but—a plea *ad hominem* for the species of retaliation to which, by a strange inconsistency, the prince was afterwards as sensitive as if he had been the most decorous and devoted husband in the world.

Here we close this most curious and painful episode—which, as we could not omit to notice it, we have stated not more fully than the case required, and, we trust, with candor, decency, and truth.

The most, perhaps we might say the only, historical fact of general interest and importance, that Lord Malmesbury's correspondence brings to light, is Mr. Pitt's constant, active, and eager desire for peace with France. No one on the continent, and but few in England beyond a narrow ministerial circle, had any idea of the extent of Mr. Pitt's pacific disposition. It is indeed very well known, and must, we think, be admitted to be an imputation on his sagacity, that at the dawn and even after some of the earlier excesses of the Revolution, he saw in it no European, and above all no British danger. On the contrary, he seems to have believed that it would for a time weaken the influence of France; and full of his great and patriotic design of repairing the loss of our American colonies and recruiting the finances of Eng-

land, he was unwilling to contemplate the possibility of another war; and accordingly it was in the spring of 1792, when we should have thought that no one could have doubted the volcanic nature of the French Revolution, and that it was about to inundate Europe with its lava or cover it with its ashes, that Mr. Pitt proposed in the speech from the throne a reduction in the Army and Navy far lower than had ever before been ventured upon. The warning voice and energetic councils of Mr. Burke—that great political prophet—failed for a considerable period to arouse Mr. Pitt from his pacific theories to a sense of the rapidly approaching danger. On the first day (in the autumn of 1791) that Mr. Burke ever dined with Mr. Pitt, it was in a *partie quarrée* at Downing-street, the others being Lord Grenville and the then speaker, Mr. Addington. Mr. Burke endeavored to alarm Mr. Pitt on the aggressive nature of French principles and the *propagandism* of Revolution. Mr. Pitt made rather light of the danger, and said in colloquial phrase, that "this country and constitution were safe *to the day of judgment*." "Yes," said Mr. Burke quickly,—“but 't is the day of no judgment that I am afraid of. This anecdote the writer took down many years ago from the mouth of one of the party. We are tempted to add another of the same kind from the same authority. At a subsequent and more formal dinner, when the whole coalition—the Duke of Portland, Lord Spencer, Lord Fitzwilliam, Mr. Burke, &c.—dined with Mr. Pitt, the conversation had turned, in a desponding strain, on the ruin of the French monarchy: and when the party rose to go to coffee, Mr. Burke, as his parting advice, addressed them in a loud voice—

“ — illic fas regna resurgere Trojæ—
Durat—et vosmet rebus servate secundis.”

When war was at last forced upon Mr. Pitt, he met it with a high and indignant spirit, and pursued it with all the energy and resources of his great mind—so earnestly indeed, that public opinion, both at home and abroad, did injustice to the sincerity of his various pacific declarations and overtures; but every line of Lord Malmesbury's most secret and confidential correspondence with him prove the *quo semel imbuta recens servabit odorem*—that all his predilections were for peace, peace, peace—and that he was always willing to pay for it a greater price than men of a less conscientious and commanding spirit would have ventured to think of.

It was in this feeling that, in 1795, some unavailing overtures were made through Mr. Wickham, to Barthelemi, the minister of the French government in Switzerland. And again, in the autumn of 1796, the successes of the Archduke Charles over Jourdain induced Mr. Pitt to believe it a favorable moment to attempt to put an end to the war, and Lord Malmesbury was selected for this mission—in which he obtained the consent of Mr. Pitt and Lord Grenville to his being accompanied, as a private friend, by Mr. George Ellis (our early colleague in this Review.)

Lord Granville Leveson, now Earl Granville, seems to have begun his diplomatic career in this mission, and Mr. Canning appears for the first time in office as under-secretary to Lord Grenville. These young gentlemen and the present Lord Carlisle, then Lord Morpeth, and one or two others, formed a kind of coterie in the Pitt party, and were all, as we shall see, much in the society

and confidence of Lord Malmesbury. This mission was, we think, hopeless from the beginning, and indeed was commenced under circumstances not calculated to command either respect or success, and which justified, as Lord Malmesbury himself good-humoredly admitted, an indignant sarcasm of Mr. Burke's—who, when some one observed that Lord Malmesbury's journey to Paris (which was impeded by the badness of the roads) had been a slow one, replied—"No wonder—he went the whole way on his knees." If, however, the advances on the part of England seemed more eager than dignified, her conduct in the negotiation gave ample proof of her sincerity and disinterestedness. She made no pretensions of her own, but solely stipulated—as she was bound by her treaties to do—for the restoration to the emperor of Germany of his Belgic provinces, for which she offered to compensate France by an adequate cession of her own colonial conquests. Lord Malmesbury's instructions might, to use his own expression, be compressed in one phrase—"Render unto Caesar the things which are Caesar's." This the directory met by an assertion that those provinces had become an integral part of the republic, and could not by their constitution be ceded; and they would listen to no expedients on that point. The truth is, that the directory were distracted with their own internal struggles, and afraid to venture on a peace, and had moreover strong hopes from the expedition then preparing under Hoche for Ireland; and were thus, on every account, resolved that the negotiation should have no other effect than to display their republican arrogance. The French public, both on the road and in Paris, did not seem to partake of this feeling, and showed the mission, as occasion offered, something of civility, and even cordiality. But the insolent deportment of the directory was increased both by the death of the empress of Russia—whose successor was supposed to be favorable to France—and by the rapid and surprising successes of Bonaparte over the Austrians in Italy, which peculiarly embarrassed a negotiation for the *status quo*. After a few weeks of idle and insulting fencing, the directory, on the 20th of December, ordered Lord Malmesbury, in the most insolent manner, to quit Paris "dans deux fois vingt-quatre heures," and the territories of the republic "de suite."

We do not find that these papers throw any more light on the essentials of this negotiation than we already have in the ordinary historical works, but there are a few incidental circumstances that may be worth notice. Lord Malmesbury found the wearing of the *national cockade* so universal in the streets, and so unpleasantly enforced by the populace, that it was impossible to appear in them without it. The government did not insist on it, but were so powerless when opposed to the temper of the people, that they could, in case of insult, have afforded no redress. Lord Malmesbury repudiates the idea of his or his suite wearing it when in any official character, but states to Lord Grenville that he trusts they do right in wearing it, in compliance with a general usage, when they walk out in the morning (vol. iii., p. 270.) To this appeal Mr. Canning tells him privately that "he will receive no answer at all from home, and that Lord Grenville and Mr. Pitt seem to be of opinion that he must do as he might think best, or find necessary." A shabby reply; for if the French government was not strong enough to pro-

tect an ambassador from insult, it was hardly in a condition to be treated with. But we are surprised that Lord Malmesbury did not state the most important element for the judgment of our ministers in such a case, namely, what the practice was with other foreign missions—of which there were a dozen in Paris; and those of Prussia, Spain, Naples, and Denmark were important enough to have afforded a precedent either of refusal or compliance on such a point of etiquette.

Again; we must observe that in the conclusion of his last notes with the French minister, Lord Malmesbury seems beyond all measure over-civil. For instance, Citizen Delacroix writes:—

"Monsieur,—Le Directoire Exécutif me charge expressément de vous requérir de me remettre officiellement dans les vingt-quatre heures votre *ultimatum*, signé de vous.

"Agrétez, &c. CH. DELACROIX."

The Editor should have given this concluding compliment, 'Agrétez, &c.' at full length, since he so gives the conclusion of Lord Malmesbury's reply. We find, however, in Debrett's State Papers for 1796, that the translated form was:—

"Accept, sir, the assurance of my high consideration."—Vol. v., p. 198.

Lord Malmesbury's reply to this cold form was, what it ought not to have been, a shade more civil:—

"Le Lord Malmesbury prie le Ministre des Relations Extérieures d'agréer les assurances de sa haute considération."—p. 364.

And to this the rejoinder was the order to quit Paris in *deux fois vingt-quatre heures*—signed *tout court* and without any compliment—"Charles Delacroix." To which gross impertinence Lord Malmesbury hastens with all humility to say that he will quit Paris next day, and

"Il prie le Ministre des Relations Extérieures d'agréer les assurances de sa haute considération."—p. 365.

As Citizen Delacroix ended his note so unceremoniously, Lord Malmesbury should have tempered his own civility with a little dignity, by saying, that "not wishing to derogate from the ordinary usages of diplomatic courtesy (or something of that sort,) he requests Citizen Delacroix to accept the assurances of his high consideration." There are, we admit, *beaucoup de puérilités dans la diplomatie*; but the maintenance of national dignity, even in trifles, is not of that class; and Lord Malmesbury's failure on this point was peculiarly unlucky, as he was especially instructed to be, and professes to have been, very nice on points of etiquette, and justifies some sarcastic observations which his old friend, Mr. Fox, made in parliament on his too well bred "assurances of high consideration."

One of Lord Malmesbury's entries in his diary is "Nov. 8.—Bonaparte said to be son of le Général Marbeuf, by a Corsican woman—well brought up by him at l'Ecole Militaire—clever, desperate Jacobin, even terrorist."—p. 304. to which the editor subjoins this note:—

"It is almost needless to state that this rumor (current at the time) was perfectly untrue. Madame Bonaparte's supposed partiality for General Marbeuf existed long after the birth of Napoleon. It is equally superfluous to add, that he never was a 'Terroriste.'"—p. 304.

. We see, no reason why Napoleon Bonaparte—

the second of eight children, and bearing a striking likeness to his elder and younger brothers—should be singled out as the son of the Comte de Marbœuf; but all the statements, and of course the reasoning, of the noble editor's note are completely erroneous. M. de Marbœuf went to Corsica in command of the French army as early as 1765—four years before Napoleon's birth; and we know that it was to the patronage of M. de Marbœuf, the friend of the whole family, that Napoleon was indebted for his education at the Ecole Militaire. As to his "never having been a Terrorist!" why, he never was anything else! But even in the more peculiar sense of the word, it would have been by no means "superfluous" if the noble editor could have shown him not to have been one of *La Queue de Robespierre*. He and his brother Lucien were protégés of the younger Robespierre in his Terrorist pro-consulate in the south; and after the 9th Thermidor the first measure of the reaction was to arrest and imprison both the brothers (as Lucien himself tells us,) for having belonged to Robespierre's faction—or, to use the common language of the time, as *Terrorists*; and Lord Malmesbury writing in Paris, two years only after the events, and while living in the best-informed circles, is better authority, even if there were no other (and there is abundance) than his grandson's wholly unsupported assertion.*

We have seen that the impediment to the negotiation of 1796 was the restitution to be made to Austria; but by the preliminary treaties of Leoben and Montebello, (18th April and 24th May, 1797,) *Cæsar* made his own bad terms; and England had now no other continental engagements than the interests of her faithful, but (in this matter) unimportant ally, Portugal; and a desire to make some arrangement as to the private property of the House of Orange. Mr. Pitt, in his unwearied desire for peace, again thought this a favorable moment to renew the negotiation with France, where there seemed both in the government and in the legislative councils a growing spirit of moderation, or even, as it afterwards appeared, of counter-revolution. The editor says:—

"Lord Grenville was decidedly opposed to this step, and long argued it with Pitt; but the latter remained firm, repeatedly declaring that it was his duty, as an English minister and a Christian, to use every effort to stop so bloody and wasting a war. He sent Lord Malmesbury to Lisle with the assurance that 'he (Pitt) would stifle every feeling of pride to the utmost to produce the desired result;' and Lord Malmesbury himself went

* We insist upon this point for the sake of historical truth, which might be compromised by the uncontradicted assertion of so respectable a publication as this; and with the same object we will take this opportunity of clearing up a doubt with respect to Bonaparte's age. We stated, in Q. R., vol. xii., p. 239, and again in vol. xvi., p. 495, on what seemed to us the best possible authority—namely, a certificate of birth produced by Bonaparte himself at his marriage with Josephine, and deposited and then and still existing in the proper office at Paris—that he was born on the 5th of February, 1768. Why or how he was led to produce this false statement has never been explained: as the Constitution of that day required that public functionaries should have attained certain ages, Bonaparte was probably willing to advance by a year and a half the period of his eligibility:—but from whatever motive, he assuredly produced a false certificate, for we have since collected many testimonies of dates prior to his celebrity and therefore of indisputable authority, which fix his birth to the 15th of August, 1769—the common date. See also the note, *Quart. Rev.*, vol. lvii., p. 366.

upon his mission, anxious to close his public life by an act which would spare so much misery, and restore so much happiness to mankind.

"On the brink of success, it will be seen by what unforeseen events he failed, for Europe was destined to eighteen more years of battles."—p. 369.

Lord Malmesbury was no doubt personally gratified at being again selected for this mission—but as Delacroix, his late discourteous antagonist, was still minister, he with great propriety and candor suggested that his nomination might not be considered as conciliatory. His surmise was just, for the first French answer stated that—

"Le Directoire consent à ce que la Négociation soit ouverte avec le Lord Malmesbury; cependant un autre choix lui eût paru d'un plus heureux augure pour la prompte conclusion de la paix."—p. 373.

Mr. Pitt, however, persisted, and was right on every account—the very circumstance of Delacroix's being still in office was a sufficient reason for Lord Malmesbury's re-appointment. But his lordship escaped the "*practical epigram*," as Mr. Canning called it, (iii. 437,) of being met by Delacroix, by the selection of Lisle as the scene of the negotiation, and the nomination of Citizens Letourneur, Pléville le Peley, and Maret, as plenipotentiaries on the part of France. The choice of these gentlemen seemed also a pledge for the sincerity of their government, as they were all anti-jacobinical. Letourneur had just left the Directory by lot—an unlucky chance (if chance it was) which eventually produced the predominance of Barras and Rewbell, and the revolution of the 18th Fructidor. Pléville was a seaman of moderate politics as well as capacity. Maret, the afterwards celebrated Duke of Bassano, had, in addition to manners and feelings of the old school, principles by no means revolutionary, and the additional recommendation of having in a short mission to London, in 1793, obtained some degree of favorable notice from Mr. Pitt. As Maret played so large a part in this negotiation, and so much a more important one in after-life, we shall extract the account which he gave of himself when on a subsequent occasion Lord Malmesbury artfully suggested that, if the negotiation succeeded, the embassy to England might repair his fortune, which he confessed to be much deranged.

"Aug. 30.—Maret assented, and intimated that if he was asked for it would forward his nomination. He then told all the story of his two journeys to England, in 1792 and 1793; his connexion with Le Brun.* He said Mr. Pitt had received him very well, and that the failure of his negotiation could be attributed to the then French government, who were bent on that war; that the great and decisive cause of the war was 'quelques vingtaines d'individus marquans et en place qui avoient joué à la baisse dans les fonds, et de là ils avoient porté la Nation à nous déclarer la guerre. Ainsi,' said he, "nous devons tous nos malheurs à un principe d'agiotage." He said, on his return to France, he was informed of this, and was considered as in possession of so dangerous a se-

* "Maret's first mission related to the domestic concerns of the Duke of Orleans. He had an interview with Mr. Pitt, and gave a favorable account of it to the convention, who sent him over again in January, 1793, with a conciliatory mission, which was rendered nugatory by the murder of Louis XVI. Le Brun was French minister for foreign affairs in 1792-93."—*ib.*

cret, that they wanted first to send him to Portugal, which he refused; then to Naples, which he was forced to accept; and that he had every reason to believe that his arrest and confinement were settled and concerted at Paris before he left. He said he spent thirty months in prison, partly at Mantua, (where if he had staid, he must have died,) and partly in the Tyrol; that the academicians in Mantua, out of regard to the memory and character of his father, interested themselves about him, and that he believed he owed his change of prison to them; that, after all, his long confinement saved his life, as he certainly should have been guillotined had he remained in France, under the government of Robespierre."—pp. 502-3.

Lord Malmesbury was again attended by Mr. George Ellis, still as a private friend, by Mr. Wellesley, now Lord Cowley, as official secretary, and by Lord Granville Leveson and Lord Morpeth as attached to the mission. The first symptoms were, however, not auspicious. He was met at the outset by three almost *sine quâ non* demands. 1. The renunciation of the style and title of *King of France*. 2. The restitution of the Toulon ships, which, having been taken only in deposit for the *lawful government* of France, we were bound—now that we admitted the republic to be a *lawful government*—to restore specifically as far as they existed, and in value, if we had destroyed them; and finally, that we should admit as a basis that we were to restore *all* our conquests from France, or any of her allies, and especially from Holland. The first of these demands perplexed our ministers very much—but *they* (rather, we presume, than Lord Malmesbury) had brought it on themselves by presenting the French with a *projet* of a treaty, which incautiously and unnecessarily began by setting forth our sovereign's *full style* and title. We say incautiously and unnecessary—because when the point was hit, Lord Grenville offered to substitute either "*King of Great Britain*," or "*Britannick Majesty*," and therefore it would have been sufficient to have used at first the inoffensive terms which were proposed when it was too late, and when the French were entitled to insist on the renunciation of a claim so imprudently, but so prominently made. But neither this nor the other two points need detain us. The negotiation never made one serious practical step during the whole four months of discussion, but was, under the formal veil of interchanging notes and *projets*, really awaiting the issue of the great contest between the Jacobins and *Modérés* in Paris; and it was, we suppose, as an episode in this conflict and as a *pierre d'attente* for the moderate party that Maret, who belonged to it, opened a secret and separate communication with Lord Malmesbury, of which, as connected with the general negotiation, we see neither motive nor object.

On the 14th of July an Englishman of the name of Cunningham, who had been long settled at Lisle, called on Mr. Wellesley, the official secretary of the mission, as on business of the utmost importance; and he produced a note from a M. Pein—an intimate friend of his, and a near relation of *Maret's*, suggesting the expediency of opening a secret and confidential channel between Lord Malmesbury and "the person who had alone the conduct of the business on the other side—viz., *Maret*—whose opinions on *all* political subjects were very different from those of his col-

leagues"—being the intimate friend of the *new* director Barthelemi, who was seriously desirous of the restoration of peace. This strange overture was readily, but not without some suspicion, accepted—Mr. Ellis (Mr. Wellesley being about to return to England) was appointed to communicate with M. Pein, and through them Maret conveyed information and advice to Lord Malmesbury, apparently in the style of one who in a game of whist should by secret signs let his adversaries know the state of his own and his partner's hand. Lord Malmesbury at first doubted the authenticity of these communications, but, in order to ascertain it, he stipulated that at the conference certain signs should be made which should evidence Maret's confederacy with Pein.

"The sign agreed upon was Maret's taking his handkerchief out of one pocket, passing it before his face, and returning it into the other."—vol. iii., p. 450.

It has been frequently alleged that M. Thiers wrote his "*History*" "under the inspiration," as the French phrase it, of M. de Talleyrand. This his friends have denied, but the way in which he mentions this secret negotiation satisfies us that he derived his information from either Talleyrand, Maret, or both, for he gives a color and character to the transaction *entirely false*, but such, we think, as these informants would deem it prudent to adopt. "*According*"—says M. Thiers, with wonderful ignorance, or still more wonderful effrontery,

"*According to the practice of English diplomacy*, all was arranged for carrying on two separate negotiations, one official and ostensible, the other secret and real. Mr. Ellis had been given [*fut donné*] to Lord Malmesbury to conduct under him the secret negotiation, and to correspond directly with Mr. Pitt. This habitual custom [*usage*] of English diplomacy is rendered necessary by their representative government."—Thiers, *Hist. de la Rév. Fr.*, vi., 18.

We really cannot imagine how a writer of M. Thiers' cleverness could imagine an "*usage*" so notoriously untrue, or think of accounting for it by reasons so grossly absurd—it is our representative government which renders any such practice utterly impossible—but this preamble was necessary to introduce the rest of the fable; and the mention of *Mr. Ellis*, whose name we very much doubt whether any man in France ever heard of but Maret and Co.,—confirms our suspicion that the Duke of Bassano communicated this misrepresentation to M. Thiers with a view to break the effect of the disclosure which he suspected might be hereafter made, and which now appears. M. Thiers then proceeds to misstate and discolor the facts to suit this apologetical version.

"Lord Malmesbury soon saw that the ostensible negotiation would come to nothing, and he took measures [*chercha*] to bring about a more intimate intercourse. M. Maret"—

We beg our readers to observe that M. Thiers always employs the deferential form of *Monsieur* Maret and *Monsieur* de Talleyrand, though they were at this time *Citizens* Maret and Talleyrand, and nothing else till they became *Duke of Bassano* and *Prince of Benevent*. M. Thiers' adoption of the *Monsieur*—so out of keeping with time and place—indicates pretty plainly, that he was writing in communication with these great personages, whom he did not venture to call plain *Maret* and *Talleyrand*.

"M. Maret, more used to diplomatic habits than his colleagues, lent himself [*s'y prêta*] to Lord Malmesbury's proposition—but it was necessary to negotiate with Le Tourneur and Pléville, [the rough colleagues,] to bring about meetings at the play. The young people of the two embassies were the first to associate, and the communications became more friendly. There had been nothing of this kind last year"—

though it is the usual and necessary consequence of the English representative government, and though the same Mr. Ellis had been there in exactly the same position—

"because the negotiation was not sincere, but this year it was necessary to arrive at effectual and amicable communications. Lord Malmesbury, then, sounded [*fit sonder*] M. Maret to engage in a private [*particulière*] negotiation. Before he consented, M. Maret wrote to the French ministry for permission. They readily agreed, and he immediately entered into private communications [*pour-parlers*] with the two English negotiators."—*Ib.*, p. 20.

What follows is still more remarkable. M. Thiers says that when the 18th Fructidor came to render the negotiation almost hopeless—

"Lord Malmesbury was so sincere in his wish to continue the treaty that he engaged M. Maret to try to find out at Paris whether there were not some means of influencing the directory, and he even offered several millions [of francs] to buy the voice of one of the directors. M. Maret refused to undertake any negotiation of the kind, and left Lille. Lord Malmesbury and Mr. Ellis went off immediately, and did not return."—*Ib.*, 72.

Now the facts of this story are scandalously perverted. The truth was this:—

"In the beginning of the negotiation, a person named Potter came to Lord Malmesbury, stating that he was sent by Barras to say, that if the English government would pay that director 500,000*l.*, he would ensure the peace. Lord Malmesbury, believing the offer to be unauthorized by Barras, or only a trap laid for him by the directory, paid no attention to it."—*Harris Papers*, vol. iii., p. 492.

It does not appear that Lord Malmesbury informed Maret of this overture, which took place before their confidential intercourse had commenced; but subsequently, on the 19th August, a Mr. Melville, of Boston in America, renewed the proposal on the part of Barras to the same amount. "But of course," said Lord Malmesbury, "his offer was rejected. I would not see him, and he conveyed it through Ellis, saying that he knew intimately Peregeaux" [the great Paris banker.] This offer and its rejection Ellis communicated to Maret through Pein, who professed to know nothing about it, and only advised him to refer to Peregeaux for Melville's character."—*Ib.*, p. 493.

Can any reader doubt that M. Thiers' version of the affair was furnished to him by the parties to these transactions? Can he doubt—after seeing the indisputable evidence so accidentally and unexpectedly supplied by this publication—that their version is false in dates, facts, motives, and everything, and that the whole was, as we have said, a precautionary *échappatoire* against future exposure?—and if that exposure had not been so unpremeditated and accidental, the false version would have answered its purpose.

It would be hard to say whether in this extraordinary underplot Maret was endeavoring to de-

ceive his French colleagues or his English confederates, or both—but it is very remarkable that this overture was made on the 14th of July, and on the 15th citizen Talleyrand was announced in Paris Minister for Foreign Affairs! It is strange that neither Lord Malmesbury nor any of his correspondents seem to have noticed this remarkable approximation, not to say *coincidence*—particularly as Maret afterwards told Lord Malmesbury that on the day that Lord Malmesbury's nomination was known at Paris, he and Talleyrand and Barthelemi had met at dinner at Barras', where the probable fate of the future negotiation was discussed. Nor must it be forgotten, that all these more than suspicious practices were nearly contemporaneous with that flagrant attempt at speculation and corruption exhibited by Talleyrand and his anonymous friends, "Messrs. X and Y, and a Lady," to the American commissioners in Paris in October of the same year, and in which the celebrated burthen of Talleyrand's eternal song—*Il faut de l'argent*—*il faut beaucoup d'argent*—first aroused the indignation of mankind. We suspect that Monsieur Maret may have known something of Monsieur X or Monsieur Y, or peradventure "the Lady." The whole story will be found in *Debret's State Papers*, vol. vii., p. 183; but M. Thiers' *History* makes no mention of this the most remarkable feature of the diplomacy of the revolution and of its greatest diplomatist. We ourselves have little doubt that Talleyrand and Maret, and perhaps Barthelemi, were at this moment confederates; indeed, M. Thiers himself states that Maret was acting under the special sanction of the minister at Paris, and there can be, we think, little doubt that *l'argent*—*beaucoup d'argent*, was the real motive of the secret negotiation with Lord Malmesbury.

The curiosity, and we may even add the historical importance of this affair will, we trust, excuse the length at which we have developed it:—we wonder indeed the noble editor himself, who often quotes Thiers, did not think it worth while to explain the important discrepancies between his story and Lord Malmesbury's testimony; and the more particularly, as Thiers asserts that Lord Malmesbury offered, and the French had accepted, an indemnity of 500,000*l.* for the Toulon ships—an assertion utterly at variance with all his lordship's statements.

The following extract from one of Mr. Canning's letters tends naturally to increase our suspicions that, besides the great political intrigue going on at Paris, there was much pecuniary jobbing in operation:—

"I shall therefore tell you without scruple, first, that what I mentioned in my former letter of Barthelemi's speculations in the funds, has been confirmed to me since, in a manner that very much persuades me of the truth of that circumstance.

"Secondly. That we have what we think here good reason to believe that Maret has a commission separate from his colleagues, (I know not whether from Dutch or French authority,) to treat for the surrender of the Cape for a sum of money. Thirdly, that the inclosed is a copy of a letter from Paris to Bobus Smith,* written the day after

* "This letter I do not find among the Harris Papers, although a subsequent one from Talleyrand to Bobus Smith is extant."—Ed. It is odd that the editor should not in his note have stated that *Bobus*—Mr. Canning's familiar *Etionism* for *Bob*—was Mr. Robert Smith, the elder brother of Mr. Sydney, and father of Mr. Vernon Smith. It is also to be regretted that he does not explain how Mr. Canning obtained possession of all this corres-

Talleyrand's nomination, and the first part of the contents of which, but not the letter itself, Bobus has since communicated to me. Talleyrand, you may not know, perhaps, has been always a great friend of Bobus', and of mine, since I went to Mr. Pitt some years ago, at Smith's desire, to endeavor to obtain a remission of his sentence of exile."—vol. iii., p. 439.

Though we have not the details of Talleyrand's letter, it appears from a further dispatch of Mr. Canning's that it was something incredible:—

"I was not quizzing you, but telling a most sober truth, when I gave you the copy of Talleyrand's letter to Smith. As a proof of its authenticity, I enclose to you the copy of another, which has been since received, but of which no communication has been made to me. It is written, as you see, in English, and (which you cannot see, but must believe as I do) in T.'s hand. You will see the remarkable coincidence of this letter with everything that you have been told."—vol. iii., p. 453.

Mr. Canning, however, states in a subsequent letter more positively:—

"29th Aug.—I have heard nothing more from Talleyrand by the former channel. Letters of his continually pass through our hands, which prove him to be stock-jobbing here to an enormous amount."—vol. ii., p. 520.

On the mention of M. de Talleyrand's name, the editor says:—

"The universal reputation of Talleyrand renders any notice of him unnecessary in a work of this kind. It is sufficient to remember that, during a life of eighty-five years, he served the old French Monarchy,—the Directory, Consulate, Empire, Restoration, and Orleans Dynasty. He must be regarded as the most able political pilot on record."—vol. iii., p. 418.

We must here take the liberty of dissenting very strongly from the noble editor, both in fact and in opinion. M. de Talleyrand never served the old French Monarchy at all, but helped powerfully to destroy it;—he served, indeed, the Directory, and in due course betrayed, and helped to overthrow it;—he served the Consulate, at the epoch and in the department in which the indelible horror of the *d'Enghien* murder was perpetrated—and he servilely followed Bonaparte through all the other steps of despotism by which his country was enslaved;—he served the Empire as he had served the Directory—that is, he got all he could out of it, and then joined to betray and overturn it;—he served the Restoration, which he was grown too rich, old, and indolent to betray, but which, in spite of his share in the *pilotage*, was dashed to pieces;—and he served the Orleans Dynasty only in the easy routine and luxury of the London embassy. As to his *pilotage*, we must admit that he followed the very ancient and prudent authority of that patriarch of pilots, Palinurus—

— superat quoniam *Fortuna*, sequamur;
Quoque vocat vertamus iter!

And certainly no pilot was ever more dexterous at managing to save himself by his own little craft, when all the great vessels in which he successively served were utterly wrecked. The noble editor seems too apt to fall into these thoughtless *engouemens*. We, on the contrary, see in M. de Talleyrand an apostate from his family, his order, his

pondence, and how Bobus (then we believe a young bar-rister) came to be engaged in these delicate affairs.

party, his religion, and, in short, from everything but himself—one whose corruption, profligacy, and treachery disgraced high birth, exalted station, and great talents—who was a prominent figure in an age of wonders, without attaching his name to anything great, glorious, or good—and whose fame is already reduced to our recollections of "X, Y, and the Lady," and of some dozen *bons-mots*—the cold, keen product of a subtle intellect, an *insouciant* temper, and a callous and misanthropical heart.

In the midst of these affairs the Portuguese minister in Paris signed, contrary to his express instructions, a treaty of peace with the republic—quite inconsistent with the engagements of Portugal with England; but it had not, as M. Thiers says, the effect of giving Maret any advantages over Lord Malmesbury, or indeed in any way affecting the Lisle negotiations; and nothing can be more untrue than his assertion, that at this period all matters had been brought to a clear understanding and arrangement. "England," says Thiers, "would not give up Trinidad; but the Dutch were to keep the Cape under an express condition that France should never obtain it. Ceylon was to be ceded to England, but under the guise of an alternative possession—a Dutch garrison alternating with an English one; with an understanding that the alternation was only to be a fiction. The 12,000,000 of francs for the Toulon ships was accepted by France, and it was agreed the title of King of France, without being formally abdicated, should be disused." On these points, says M. Thiers, Maret and Malmesbury had agreed, when the 18th Fructidor came to overset all. Now we know, from Lord Malmesbury's notes and confidential letters, that not one of all these points was settled—nay, that he could not get the French negotiators to approach any of the minor subjects *en attendant* the discussion of the Dutch questions:—perhaps Maret may have had instructions to agree to these terms, but if he had he certainly never produced them, and the whole of M. Thiers' statement is, therefore, erroneous, and introduced for no other reason that we can see but to glorify Maret. It is perfectly clear that the French mission had no other orders or purpose than to waste time. The Directory, in the personal and mortal struggle in which they were now engaged with the councils, paid evidently little attention to the details of the negotiation, and were only endeavoring to tide over all such inferior matters, till, at last, on the 18th Fructidor, the explosion took place which confirmed the power of Barras and the ultra-republicans, and scattered all the *Modérés*, except Talleyrand, into exile. The French mission at Lisle was immediately recalled, and replaced by Treilhard and Bonnier, who were ordered to insist on having Lord Malmesbury's *pleins pouvoirs* to concede any and all our conquests, produced to them; and on his refusal to comply with so strange a demand, he was insolently dismissed, with the insulting addition that, as he had no instructions, he had better himself go and look for them.

"Il [Lord M.] aura à déclarer ses pleins pouvoirs suffisants, [that is to say, sufficient for the unconditional restitution of all the king's conquests,] et à les exhiber d'abord; et en cas qu'il ne les a pas, d'aller en Angleterre les vingt-quatre heures les chercher lui-même."—vol. iii., p. 581.

Thus, if his embassy did not begin with "a practical epigram," it ended with one; and it was surely too strong a proof of Mr. Pitt's obstinate

desire for peace that, even after this affront, both he and Lord Malmesbury still thought that the negotiation should be continued, and Lord Malmesbury on his arrival in London found there two emissaries—one from Talleyrand, and the other from Barras—both offering “any terms we choose for money.” Barras’ present terms are not given, but we have seen that they were lately stated at 500,000*l.* Talleyrand’s, as produced by one O’Drusse, who is—we know not whether jocularly—designated as the *Grand Vicaire of the Bishop of Autun*, were more moderate—only 200,000*l.*, for consenting to leave us one of the Dutch settlements—probably Ceylon (iii., 580.) It is with pain and shame that we copy the following extract:—

“Friday, Sept. 22, 1797.—At his request, at half past eleven with Pitt; the Note altered as we wished. He said *I was quite right* as to judging it was *right to continue the negotiation*; his informant [Barras’ emissary] said it was necessary to the plan of the Directory; he [Pitt] had informed him of our intentions; he [the informant] was actually gone to Paris to prepare the way for proper instructions being sent to Lisle. I said I trusted he [Pitt] had been very explicit both as to the terms and the price; that *no cure no pay* should be stipulated—not a penny to be given till after the ratifications, and every article valued and paid for *ad valorem*; that I should never return to Lisle for any other purpose but to *sign a treaty*; and that before I left England we should see an *arrêt* of the Directory, fixing the terms and instructions given by them to Treilhard and Bonnier in consequence. This Pitt said was actually done, and agreed with me that nothing short of it was worth attending to. * * * Pitt sanguine, *more sanguine* than I am. I see doubts and dangers in all this *secret intelligence*. I admit the *desire* of getting the money, but I question the *power* of delivering the thing purchased. *Barras confessedly the only one in the secret*: he and his expect to persuade Rewbell, and to prevail on him to take his share of the bribe. *Thence* my apprehensions; and it clearly appears that the two informants act separately. It is to be remarked that Huskisson is in the whole secret; but it is enjoined that he is not to say so to Pitt, or Pitt to him. I dislike Huskisson, both as to his principles and the turn of his understanding; he wants to make money by this peace, and dares not apply to me to act with him; the whole secret was known in the city the day it was told Pitt, and acted on by the stock-jobbers; *stock-jobbing is at the bottom of the whole, I fear.*”—vol. iii., pp. 582–4.

We hope and believe that this imputation against Mr. Huskisson was merely Lord Malmesbury’s hasty impression against a man whom he confesses that he did not like, and of whose proceedings in this matter he admits that Mr. Pitt was aware, which seems to us a sufficient voucher that the proceedings were disinterested and honorable; but the rest of the story certainly agrees with the known characters of Talleyrand and Barras; and while we regret that Mr. Pitt should have for a moment listened to such propositions, even for the great and “Christian” object of ending the war, we cannot suppose that he gave in to it without some strong reason to believe in the authenticity of the offers. On this point of the character and policy of Mr. Pitt, as contrasted with that of Lord Grenville, we shall conclude with the words of the Editor:—

“Mr. Pitt has always been held up to the present generation as fond of war: but the Harris Papers could furnish the most continued and certain evidence of the contrary, and that he often suffered all the agony of a pious man who is forced to fight a duel. The cold and haughty temper of Lord Grenville was less sensitive; our overtures were to him synonymous with degradation, and he could not now brook the delays of the Directory.

“Lord Malmesbury entirely agreed with Pitt, and at this time saw a fair chance of obtaining an honorable peace.”—vol. iii., p. 516.

It is the mischief of these unilateral, truncated revelations, that they lead to conclusions often the very reverse of that which, if we had both sides of the *continuous* story, we should probably arrive at. For instance, would it not seem from the passages—*à bâtons rompus*—which we have quoted, that Mr. Huskisson was a knave and Mr. Pitt a dupe? There is nearly the same evidence for both, and we as little believe the former as the latter, and yet we do not see what answer can be now made to Lord Malmesbury’s broken hints than a general appeal to the characters of those two statesmen.

With this mission ended Lord Malmesbury’s diplomatic life—which exhibits the extraordinary paradox of a long series of failures—unbroken by any one happy result—which, nevertheless, procured for the always defeated yet always fortunate agent the highest reputation and the most splendid rewards. We offered in our former article some considerations which might account for so extraordinary a phenomenon; the details of the missions comprised in the third volume confirm those opinions. Great diplomatic results seldom depend on the abilities of the agents, but on the interests and power of the principals. Lord Malmesbury failed through no fault of his: in the negotiations with Prussia and France we do not believe any man could have done better—in the strange circumstances into which he was thrown at Brunswick we cannot name any man who we think could have done so well.

Lord Malmesbury now retired from public business, but we can hardly say from public affairs; for although, as he told Mr. Canning in March, 1801, as an excuse for his not thinking, in that season of ministerial changes, of any official employment, “he was tied to his chair, and never expected to move ten yards from it,” (vol. iv., p. 35,) still, as a peer, he had a responsible and indefeasible station in political life, and was, moreover, from temper and habit, led to enliven his dignified leisure by a strong curiosity and occasionally a busy share in the party struggles of the day. His residence was on the edge of what Dr. Johnson called the great tide of human existence—first in Spring Garden, in a fine house where in later days we remember Lord Dover and the present Duke of Bedford, and afterwards in old Richmond House, where Richmond-terrace has been since built, and he possessed for some years the beautiful villa of Park Place, near Henley. In town he kept an excellent and hospitable table; and as age confined him more and more to home, he was happy to receive the many morning visitors that—thus living in the gangway to the houses of Parliament—his numerous acquaintance were always ready to pay to one whose lively curiosity, extensive information, polished manners, and varied conversation amply rewarded their attentions. He had all his life been fond of the company of young people. He had early formed a close inti-

macy with Mr. Canning—whose friendship for Lord Malmesbury was, says the Editor, like that of an affectionate son—and he had, as we have seen, surrounded himself with Mr. Canning's personal friends, and to the last he continued to cultivate the acquaintance of the young men who began to distinguish themselves in public life. These circumstances and connexions, with his old diplomatic taste for gossip and those little political manoeuvres commonly called *intrigue*, kept him *au fait* of all that was going on—or at least all that was *said* to be going on—for there is a vast difference between the *reality* of such affairs and the *rumors* of even the best informed circles. The fourth volume of this work is wholly occupied with a diary kept by Lord Malmesbury, with great assiduity, of all he heard and saw of public affairs—(interspersed with some interesting correspondence, especially with Mr. Canning and the Duke of York)—from Mr. Pitt's resignation in the first days of 1801, down to the Convention of Cintra in 1808.

No extracts that our space would allow us to make could afford an adequate idea of this great mass of mingled gossip and history. Lord Malmesbury's pen had no touch of pleasantry, nor even of vivacity, and it would therefore not be easy to produce amusing specimens of what is yet a very amusing whole. To us, and to the many still living who, like us, happen to have been contemporary with the events—who have seen all and known most of the *dramatis personæ*—nothing can be more attractive; we seem to be living our youth over again. We may fancy ourselves walking down rather early to the House, and turning in at Richmond Gardens to while away the spare half-hour with the *old Lion*—as “from his brilliant eyes and profusion of white hair” Lord Malmesbury was not unwilling to be called by his younger associates; but we doubt whether it will have the same success with more distant and more disinterested readers. And even with us and our contemporaries the first impression is by no means favorable to the taste or discretion of the publication, as regards either the noble diarist himself or those of whom he treats. We meet in every page harsh mention of names that we have loved and respected; and we know, even within our own narrow circle, that a considerable degree of private feeling has been painfully excited. But upon further reflection a good deal of that will wear off. Many of the harsh things that Lord Malmesbury says under a momentary influence, he soon unsays, and of many others he himself supplies the means of refutation; and one thing may be said for him—that though he evidently had strong biases, he never seems to have wilfully misrepresented any one; and it turns out—singularly enough—that the person whom of all others he seems most to have disliked—Lord Grenville—makes nearly the best figure in the book for both consistency and sagacity, while his most intimate and applauded friend—the late Lord Chichester—if we were to take all that is said of him *au pied de la lettre*, would appear irresolute, self-interested, and blamably indiscreet. We are inclined to believe that no public man ever kept an honest journal of his daily *opinions* on events, and especially on *persons*, who would not, after a lapse of time, read over many of his entries with regret, and sometimes with self-reproach, for his own credulity or injustice. Let us allow to Lord Malmesbury and his victims the advantage of these indulgent considerations. He notes down what he has

heard and believes, often erroneously, but always, we believe, honestly, and the veracity of the chronicler is not to be confounded with the accuracy of the facts. Lord Malmesbury *sat at the receipt of custom*, and news was the tribute which his friends paid him; but it was often in coin clipped or debased, or even absolutely counterfeit.

In any daily record of passing events and fluctuating opinions there must be frequent inconsistencies and contradictions, and Lord Malmesbury's “Correspondence and Diaries,” taken as a whole, tell, we think, almost as much against himself as against any one he names. We have already shown how little they maintain his diplomatic reputation, and they no better vindicate his own private consistency. On the king's illness in 1601, Lord Malmesbury collected every rumor of the undutiful and unfeeling behavior of the Prince of Wales towards his afflicted father, quite forgetful that, after having obtained from the same king the greatest personal favor a subject can receive, he himself had under similar circumstances in 1788 abetted the same Prince of Wales in conduct much more undutiful and unfeeling than that with which he now reproached him. What is the key to this?—Lord Malmesbury had reconciled himself to the king, had been honorably employed, created viscount and earl, and, having enrolled himself as one of the *king's friends*, had naturally fallen out with the prince. But when we turn over a few pages Lord Malmesbury's candor affords us some reason to doubt the truth of his imputations against the prince:—

“*March 7, 1801.*—Prince of Wales yesterday evening and this morning with the king; his behavior there right and proper. How unfortunate that it is not sincere; or rather that he has so effeminate a mind as to counteract all his own good qualities, by having no control over his weaknesses!”—vol. iv., p. 33.

Here we see proper conduct admitted, with an ingenious surmise that it would not be lasting; but then by-and-by we find the following anecdote recorded:—

“*March 24.*—Lord Carlisle, Lord Lansdowne, Lord Fitzwilliam, and Fox have coalesced. It is said they informed the Prince of Wales, through Lord Moira, of this step, tendered him an offer of their services, and that they should hold their conferences at Carlton House. The prince, it is said, replied, that he was under too much anxiety for the king's health to think of politics; that he thanked them for their communication, but not only declined their proposal, but observed that, out of respect to the king, he considered it as his duty to acquaint Mr. Addington with it, and this he immediately did.”—vol. iv., p. 51.

And henceforward we hear little or no more on the subject of the prince's undutiful behavior; and indeed there are some strong statements of a direct contrary tendency.

Again; we have fresh in our recollections Mr. Pitt's efforts, his perhaps too anxious efforts, for peace; and we are told that in 1800 he was about to make another attempt, and would have named Lord Malmesbury for it, (iv., 28;) and yet we find Lord Malmesbury, so early as the 4th of March, 1801, saying in derogation of Mr. Addington, then about to replace Mr. Pitt,—

“*March 4.*—Addington's mind is full of peace—no great proof of strength of character, wisdom, or statesman-like knowledge, in such times as these.”—vol. iv., p. 28.

Thus Pitt is applauded and Addington sneered at for the same identical policy.

Again, he says of Mr. Pitt's resignation,—

"Feb. 7.—It looks at times to me as if Pitt was playing a very selfish and, in the present state of affairs, a very criminal part; that he goes out to show his own strength, and under the certain expectation of being soon called upon again to govern the country, with uncontrolled power."—vol. iv., p. 4.

And when the king's illness, consequent on the anxiety this resignation caused him, became alarming, the diarist expresses his loyal indignation in terms which clearly allude to Mr. Pitt as one of those—

"Feb. 22.—Who acted in order to gratify their private resentments, or promote their ambitious views; and these men, let them be who they will, may be considered as the most consummate political villains that ever existed. They ought to be held in execration by the country, and their names handed down to posterity with infamy; for they will have been the first cause of the destruction of the intellects or life of a sovereign, to whose kingly virtues, and to whose manly and uniform steady exertion of them during a reign of forty years, this country, and every subject in it, owes the preservation of its liberties and everything that is valuable to him."—vol. iv., p. 15.

And again, when the king grew better,—

"March 7.—The king, in directing Willis to speak or write to Pitt, said, 'Tell him I am now quite well, quite recovered from my illness; but what has he not to answer for, who is the cause of my having been ill at all?' This, on being repeated, affected Pitt so deeply, that it immediately produced the letter (the most dutiful, humble, and contrite) mentioned above, and brought from him the declaration of his readiness to give way on the Catholic question."—vol. iv., p. 32.

And finally,—

"March 9.—The whole is a very sad story—the work of mean and bad passions; a trial of strength which a great subject presumes to institute with his king, and a king to whom he owes all his greatness. It began in this, continues in this, and will end in it, and ruin follow to the common weal."—vol. iv., p. 40.

And after all this, we find him within a few weeks suggesting and carrying on an intrigue to force this "political villain" back into office; and within three months we find the following entry:—

"June 8.—I was with Pitt at his breakfast. I told him that I had much satisfaction in assuring him that I should follow his line in politics; that I understood his motives, and respected them in acting as he had done."—vol. iv., p. 263.

Again; there is no one, we think, whom Lord Malmesbury mentions with more asperity than the late Lord Auckland, and particularly for his supposed share in disturbing the king's mind in 1801, by alarming him against the designs of Mr. Pitt on the Catholic question. Yet we shall find Lord Malmesbury himself pursuing the same line, (and without so strong a duty,) and instigating the Duke of Portland to take similar measures for encouraging the king to resist the Catholic concessions proposed by the *Talents*.

We could produce many more instances of the same kind of contradictions; but these will suffice, our object being not to complain of Lord Malmesbury's injustice or inconsistency, but to expose the

consequences of any system of *journalizing*, in which—though the rumors of one day are effaced by those of the next, yet the false report and the true one—the passing impression and the permanent conviction—are equally recorded, and when they happen, by breach of faith or mistaken zeal, to be published promiscuously, become offensive to private feelings and delusive to public opinion. In the present case, however, we repeat that no great harm is done; for to those who attentively read the *whole* Diary, very little of that which seems to bear hardest upon individuals will be found of any real weight or authority.

The diary opens with the change of ministry in 1801, and with his majesty's illness, which Lord Malmesbury states very truly, was produced by the agitation of the royal mind in being forced to part from Mr. Pitt—with whom he never before had had a difference (iv., p. 7)—in such a crisis of the world, and on a point which his majesty felt not merely as invalidating the constitutional right by which he held his crown—but as irreconcilable with what he held dearer than his crown—his religion and his conscience.

Lord Malmesbury states that the origin of the king's illness was

"A cold caught by his remaining so long in church in very bad snowy weather on the day appointed for a general fast, 13th February; and the physicians do not scruple to say, that although his majesty certainly had a bad cold, and would, under all circumstances, have been ill, yet that the hurry and vexation of all that has passed was the cause of his mental illness; which, if it had shown itself at all, would certainly not have declared itself so violently, or been of a nature to cause any alarm, had not these events taken place."—vol. iv., p. 19.

The following anecdote, however, which we received very soon after the event from a person who was present, proves that the mental excitement preceded the cold caught on the 13th February. The king was always in the habit of repeating the responses in the church service very audibly; but on this day, when he came to the following response of the *Venite*, he leaned over the front of his seat, and with an air of addressing the congregation, he repeated in a loud, emphatic, and angry tone—"Forty years long was I grieved with this generation, and said, it is a people that do err in their hearts, for they have not known my ways." "It was impossible," said our informant, "not to see that all the perplexities and troubles of his forty years' reign were, by the new difficulties pressed upon him by one whom he so much regarded as Mr. Pitt, revived at the moment on his excited and morbid memory." Lord Malmesbury tells us that as early as the 6th or 7th of February,

"The king at Windsor read his coronation oath to his family—asked them whether they understood it—and added, 'If I violate it, I am no longer legal sovereign of this country, but it falls to the house of Savoy.'"

And in the entry for the 26th of February we read—

"The king on Monday, after having remained many hours without speaking, at last towards the evening came to himself, and said, 'I am better now, but I will remain true to the church.'"—vol. iv., p. 19.

Lord Malmesbury is all along very indignant with Mr. Pitt for not having prepared the king's

mind for Roman Catholic emancipation as the necessary consequence of the Union, and lays all the blame on the *suddenness* of the announcement. We have no proof that Mr. Pitt may not have approached the subject with the king, and we have a strong conviction that no degree of preparation or persuasion would have induced his majesty to view with less than utter horror any measure involving (as he considered it) the violation of his coronation oath. It has been a general opinion—and Lord Malmesbury seems at one time to have believed—that Mr. Pitt seized this occasion of *resigning*, with the object of allowing Mr. Addington the mortification and odium of making a peace. Lord Malmesbury shows clearly that Mr. Pitt never evaded that responsibility himself, and that he even took a supererogative responsibility in advising Mr. Addington in his negotiations; but he does not say that which we are enabled to assert from Mr. Addington's own report of his conferences with the king and Mr. Pitt—*viz.*, that when Mr. Pitt went *last* into the closet to press the Catholic question on his majesty, he had still hopes of being able to prevail; the more so, as the king pressed him with the greatest earnestness and affection not to desert him; but that when, after a long and warm conversation, Mr. Pitt declared peremptorily that he could not yield the point, the king suddenly changed his manner, and *dismissed him*!—and when Mr. Pitt, in his surprise, attempted some rejoinder, the king in civil but very decided terms declined any further discussion.

During all the preliminary arrangements for the new administration nothing could be more composed, more clear, more rational, than his majesty's conduct—but the effort overpowered him, and the scenes which we have just quoted with his family and in the chapel show the progress of the excitement. We cannot follow all the daily vicissitude's of his majesty's illness; but our readers will see with great interest the following account of Lord Malmesbury's first interview with the king after his recovery:—

"29 Oct., 1801.—I went to Windsor to present to the king and queen copies of the new edition of my father's works. I saw them both alone on the morning of the 26th. * * * I was with the king alone near two hours. I had not seen his majesty since the end of October, 1800, of course not since his last illness; * * * but he did not look thinner, nor were there any marks of sickness or decline in his countenance or manner; these last were much as usual; somewhat less hurried, and more conversable, that is to say, allowing the person to whom he addressed himself more time to answer and talk, than he used to do when discussing on common subjects, on public and grave ones. I at all times for thirty years have found him very attentive, and full as ready to hear as to give an opinion, though perhaps not always disposed to adopt it and forsake his own. He was gracious even to kindness, and spoke of my father in a way which quite affected me. He expressed great satisfaction at seeing me less ill than he expected; asked how I continued to keep well; and on my saying, amongst other reasons, that I endeavored to keep my *mind quiet*, and dismiss all unpleasant subjects from intruding themselves on it, the king said, "T is a very wise maxim, and one I am determined to follow; but how, at this particular moment, can you avoid it?" And without waiting he went on by saying, "Do you know what I call the Peace [of Amiens?]"—an

experimental peace, for it is nothing else. I am sure *you* think so, and perhaps do not give it so *gentle* a name; but it was *unavoidable*. I was abandoned by everybody, allies and *all*. I have done, I conscientiously believe, for the best, because I could not do otherwise; but had I found more opinions like mine, better might have been done.

"I thought the subject might agitate the king, and therefore tried to lead him from it; he perceived my drift, and said, 'Lord Malmesbury, you and I have lived on the active theatre of this world these thirty years; if we are not become wise enough to consider every event which happens quietly, and with acquiescence, we must have lived very negligently. What would the good man who wrote these excellent books (pointing to the copy I had just presented to him of my father's works) say, if we were such bad philosophers, having had such means of becoming good ones?' and then his majesty reverted again to the peace, spoke of the state of Europe, of France, and this country; and by the turn of conversation it happened that the king and myself, almost in the same moment, agreed that it was a most erroneous and dangerous maxim which prevailed, that Jacobinism was at an end or even diminished; that it was only quieter because it had carried *one* point, but we should soon see it blaze out again, when it had another in view; and from that the king passed to the court of Berlin, which he spoke of with great displeasure, even acrimony: 'This is the young man,' said he, 'of whom the great Frederic said—"on ne lui arrachera jamais la couronne," and we shall live, possibly, to see him without even his electoral dominions.'"—vol. iv., pp. 62, 63.

It will, we think, be admitted that the old "Philosopher of Salisbury" himself could not have made more judicious, nor his accomplished son more appropriate and statesmanlike observations than these of King George III., of whom we repeat with increased confidence since Mr. Twiss' publication of his notes to Lord Eldon what we said on a prior occasion, that if "ever, and to whatever extent, his daily correspondence with his several ministers on the various business of the state shall be published, the world will then, and not till then, be able duly to appreciate his virtues and his talents."—Q. Rev., vol. lxx., p. 282.

A great part of the Diary is taken up with the details of a ridiculous intrigue concocted, as it seems, between Mr. Canning and Lord Malmesbury in the winter of 1802-3, for forcing Mr. Addington to make way for Mr. Pitt's restoration to power. Mr. Canning, as was natural to a young man of his lively genius, aspiring hopes, and personal attachment to Mr. Pitt, had from the first regretted the late resignations, and greatly undervaluing the less brilliant qualities of the successors, he had, contrary to Mr. Pitt's wishes—and indeed at some risk, as it seems, of impairing their political and even their private friendship—endeavored to discredit the ministry by censure and ridicule in the press, and by occasional sarcasms in parliament. These missiles not producing the desired effect, he, in concert with Lord Malmesbury, formed a plan which, without compromising Mr. Pitt, who (as they well knew) would listen to no such expedients, should force Mr. Addington to be the instrument of his own downfall.

As a specimen of the candid inconsistency of Lord Malmesbury's diary, we may quote the fol-

lowing character which he gives of Mr. Canning at this period of his life :—

"Jan. 24, 1803.—Canning has been forced, like a thriving plant in a well-managed hot-house; he has prospered too luxuriantly—has felt no check or frost. Too early in life, he has had many, and too easy advantages. This, added to very acute parts, makes him impatient of control. Astonished to find obstacles and difficulties in his way; angry with those who conceive less quickly and eagerly than himself, or who will not keep pace with him in his rapid plans and views; and indulging an innate principle of vanity, he under-rates others, and appears arrogant and contemptuous, although really not so. This checks the right and gradual growth of his abilities; lessens their effects, and vitiates the very many excellent, honorable, and amiable qualities he possesses. The world, who judge him from this, judge him harshly and unfairly; his success accounts for his manners. Rapid prosperity never creates popularity, and it requires a most careful and conciliating conduct to make the two compatible."—pp. 169, 170.

We quote this—not as a just, and still less as a favorable character of an early friend, for whose public and private qualities we preserve and cherish the highest admiration and the most affectionate regard; but, for the sake of observing that it was with this *spoiled child*, as he thought him, that Lord Malmesbury—at the age of near threescore, and professing to have retired from public life—chose to associate himself in an intrigue, as absurd in all its parts as can well be conceived. Its details would be tedious; but the substance was this—

"Nov. 1, 1802.—It was thought right to draw up a paper to be signed, if approved, by persons of eminence in different public avocations, in each house of parliament, to be presented by them to Mr. Addington; its object, as will appear from the paper itself, was to prevail on him to remove spontaneously, and prevent the matter being brought before the public."—p. 87.—

and "when signed by a sufficient number of leading and independent men of all descriptions in each house," from whom it was supposed to emanate, it was to be presented simultaneously to Mr. Pitt and Mr. Addington, and by the *Duke of York* (whom Lord Malmesbury had already initiated into the design,) conveyed to the king. So far, so well. We can fancy our young political *Hot-spur* exclaiming, "Our plot is a good plot as ever was laid—our friends true and constant; a good plot—good friends and full of expectation—an excellent plot, very good friends. Why my Lord of York commends the plot and the general course of the action!" Alas! when all those "good friends" and the many "persons of eminence" were to be assembled to sign the important document, it was found that there were no such persons in *rerum naturâ*—not one—and that the whole confederacy consisted of no soul but the original *oterie* which had imagined it, Mr. Canning, Lords Granville Leveson and Morpeth, and our venerable diplomatist;—but genius and art united are never without a resource—and behold, Mr. Canning writes to Lord Malmesbury—

"Nov. 15th.—If, after all, neither imposing signatures nor spokesmen can be had, the last resort is to send the paper unsigned, with something like the enclosed *prescript*!" (?)

"PROPOSED PRESCRIPT.

"It is thought to be most respectful to Mr. Ad-

dington and Mr. Pitt, that the enclosed paper should be transmitted to them without the signatures, which are ready to be affixed to it."—p. 103.

We can easily conceive the spirit of fun in which Mr. Canning penned this ingenious *prescript*—the very title of which would have revealed its author;—but when Lord Malmesbury lent his graver and more deliberate countenance to the device of signifying signatures *to be ready*, since *none were to be had*, he could not have had in his thoughts that excellent maxim, which he afterwards so forcibly inculcated on another young friend,—

"April 11th.—It is scarce necessary to say that no occasion, no provocation, no idea, however tempting, of promoting the object you have in view, can need, much less justify, a *falsehood*. Success obtained by one, is a precarious and baseless success. Detection would ruin not only your own reputation forever, but deeply wound the honor of your cause."—p. 414.

We need not pursue this bubble to its bursting and vanishing into nothing; but we must just notice the extraordinary efforts of Mr. Canning and Lord Malmesbury to persuade Mr. Pitt not to attend the house of commons, lest his presence should seem to countenance the ministry—and the ludicrous gravity with which Mr. Canning deploras the failure of his "*capital measure*," which was a device to prevent Pitt's keeping an engagement to dine with Addington at Richmond Park, which the infatuated ex-minister, contrary to the most earnest efforts of his young friend, persisted in doing. All this is very amusing as we read it, but it is humiliating to think of; and in this case, as in others of the Diary already noticed, we think that the person who was most disliked makes really the best figure, and that the sober good sense and good faith of Mr. Addington contrast very favorably with the various ingenious, but not very ingenious devices, that were employed to supplant him.* As to Mr. Pitt's share in these transactions, we are glad to be able to say that, though the hopes and wishes of Mr. Canning and Lord Malmesbury may seem to throw some doubts over the candor of his conduct towards Mr. Addington, all that he himself was responsible for—his own words and actions—are not liable to any serious reproach:—to none at all, we think, in the *earlier period* of the Addington administration; for the evidence of Lord Malmesbury leaves no doubt that he was perfectly and zealously sincere in his endeavors to restrain the hostility of his younger friends who had resigned with him, as well as to confirm the support of those of his former colleagues who had taken part in the new government;—so much so that when Mr. Pitt heard accidentally, on the 10th March, 1801, that the Duke of Portland intended, on his own part and that of his other colleagues, to propose to Mr. Addington to recall Mr. Pitt,

* We are glad to be able to say that Lord Sidmouth's papers are in the hands of his son-in-law, the Dean of Norwich, and we have reason to hope that the Dean is preparing for the press a work that will do to that honest minister and excellent man more justice than has yet been done to his abilities and public services. Lord Malmesbury seems to have been much prejudiced against him by the influence of Mr. Canning's pleasantries. We have, however, ourselves seen evidence, which we hope may exist in Lord Sidmouth's papers, that at a subsequent period Mr. Canning, in a very frank and generous manner, (as was his nature,) expressed his regret for their former differences.

the latter waited on the duke, and in the most peremptory manner prohibited any such interference with Mr. Addington, (iv. 42;) and when, on the 14th, in pursuance of the same views, Mr. Canning pressed Mr. Pitt for a categorical answer as to his real feeling towards Mr. Addington, Mr. Pitt—

“Without hesitation, and in the most unqualified manner, replied, that it was impossible to have behaved with more confidence, more openness, more sincerity, than Addington had done, from the first moment to this; and that the manner in which he had conducted himself, added to his long friendship for him, had raised him higher than ever in his good opinion.”—p. 46.

And amidst not a few subsequent provocations on the part of Mr. Canning and his “young friends,” who were exceedingly dissatisfied and angry at his reserve, he steadily adhered to his engagements with Mr. Addington.

As time lapsed, and circumstances changed, so, no doubt, did in a certain degree the mutual relations of the late and existing ministers, and Mr. Pitt became naturally more and more reluctant to attend in parliament the discussion of new measures which he had not advised and might not approve, but which his general inclination to support Mr. Addington disabled him from opposing. In the spring of 1803, however, this state of affairs was essentially altered, by Mr. Addington's making him an overture for his return to office, but on terms which Mr. Pitt thought he could not accept. The particulars of this transaction are given by Lord Malmesbury in much and interesting detail; and we are bound to say that the conditions were such as we do not think Mr. Pitt could have accepted, though his refusal was somewhat too haughtily stated. This affair, however, seems to us to have placed the rival parties on new and independent ground; it was a fresh point of departure; and though Mr. Pitt appeared still very reluctant to oppose the ministry, his connexion became gradually less cordial. Mr. Addington about this time fancied that he strengthened himself by offering office to Mr. Sheridan and others of the old opposition, and by actually bringing into his government Mr. Tierney, who a few years before had fought a duel with Mr. Pitt. This seems to us to have fairly released Mr. Pitt altogether:—and at last, after many moves on the political chess-board, which may be followed very agreeably in Lord Malmesbury's Diary, Mr. Pitt concurred with Mr. Fox and the old opposition in several important votes, particularly one on the defence bill, in which Mr. Addington had a majority of only thirty-seven, on which he resigned, and Mr. Pitt returned to office—almost alone.

Lord Malmesbury details the circumstances in which this short-lived and unfortunate administration was formed on so narrow a basis, after Mr. Pitt had proposed for office his new ally Mr. Fox, and his old connexions the Grenvilles, &c., for whose sake he, no doubt, had broken off the negotiation with Mr. Addington in the spring of 1803. The king had now positively excluded Mr. Fox, and though the latter very generously desired that this might not prevent the accession of his friends to office, they all made common cause with him. Mr. Canning and Lord Granville Leveson were zealous for the introduction, first of Mr. Fox, and then of the Grenvilles—but all parties adhered to their resolutions, and Mr. Pitt, instead of forming a new government, found himself in the necessity of doing little more than taking Mr.

Addington's place in the old one. We have heretofore ventured to express our doubts as to Mr. Pitt's policy in all this affair—his original breaking-up of the great party of which he was the head—his present failure to reunite it—his ousting Mr. Addington's government before he knew on what basis he could replace it—and, above all, the way in which, first and last, he dealt with the Roman Catholic question. Lord Malmesbury's details are too long to quote *in extenso*, and too connected to be separated, but they will be read with interest, and the result may be thus stated—that the precarious state of the king's mental health, never so liable to disturbance as from the Catholic question—the peculiar difficulties created by Mr. Fox's former profession of French principles and his consequent removal from the privy council—and the great and growing perils of the country, both internal and external, afforded not merely an obvious apology, but—in the opinion of Lord Malmesbury, the Duke of Portland, and the great majority of Mr. Pitt's friends, and, no doubt, in Mr. Pitt's own conscientious conviction—a full justification of proceedings which, in opposition to such authority, we can hardly persist in blaming, though we can never cease to regret. These difficulties helped to accelerate his death, if they did not absolutely cause it, by anxiety, disappointment, and affliction: the impeachment of Lord Melville, and the battle of Austerlitz, filled the cup of bitterness, and he died, as was emphatically said, at 46, of old age and a broken heart.

In alluding to the last moments of this illustrious man, whose glorious eloquence we heard with youthful admiration, we have a melancholy pleasure in laying before our readers, whom we may presume to be admirers of the name and character of Pitt, the following interesting anecdotes, which the noble editor has given us from the note-book of his amiable and able father, the second Earl of Malmesbury, while he was Lord Fitzharris, and a member of Mr. Pitt's last Board of Treasury.

“On the receipt of the news of the memorable battle of Trafalgar, (some day in November, 1805,) I happened to dine with Pitt, and it was naturally the engrossing subject of our conversation. I shall never forget the eloquent manner in which he described his conflicting feelings, when roused in the night to read Collingwood's dispatches. Pitt observed, that he had been called up at various hours in his eventful life by the arrival of news of various hues; but that, whether good or bad, he could always lay his head on his pillow and sink into sound sleep again. On *this occasion*, however, the great event announced brought with it so much to weep over, as well as to rejoice at, that he could not calm his thoughts, but at length got up, though it was three in the morning.”

“The battle of Austerlitz and its consequences, which he saw in their true light, greatly disappointed and depressed him, and certainly rather accelerated his end. I well remember walking round St. James' Park with him in November, 1805. He was naturally of a sanguine disposition. His plans were vast and comprehensive, and held out to his powerful mind the hope of establishing a European Confederacy, that should crush French ascendancy. When *that battle* was fought, the last ray of hope was so dimmed as to leave him without the possible expectation of seeing the fulfilment of that for which he had so long, so strenuously, and so successfully exerted himself, and which he felt (if ever accomplished) must be

brought about by other hands than his. He resigned himself to the will of that Providence to whom he had always looked up, as well in the days of victory as in the hour of peril, and calmly awaited that last call to which we must all respond, with the true spirit of a Christian, and felt that his end had too nearly run out for him to think any longer of worldly matters. He went to Bath, and only returned to Wimbledon, (where he had a villa,) to die there."

"I have ever thought that an *aiding cause* of Pitt's death, certainly one that tended to shorten his existence, was the result of the proceedings against his old friend and colleague, Lord Melville. I sat wedged close to Pitt himself the night when we were 216 to 216; and the speaker, Abbott, (after looking as white as a sheet, and pausing for ten minutes,) gave the casting vote against us. Pitt immediately put on the little cocked-hat that he was in the habit of wearing when dressed for the evening, and jammed it deeply over his forehead, and I distinctly saw the tears trickling down his cheeks. We had overheard one or two, such as Colonel Wardle, (of notorious memory,) say, they would see '*how Billy looked after it.*' A few young ardent followers of Pitt, with myself, locked their arms together, and formed a circle, in which he moved, I believe, unconsciously out of the house; and neither the colonel nor his friends could approach him.

"I met Pitt at Lord Bathurst's in Gloucestershire, where he passed some days, [in December, 1802.] We went to church at Cirencester. In discoursing afterwards on the beauties of our liturgy, he selected the *Thanksgiving Prayer* as one particularly impressive and comprehensive. The one, '*In Time of War and Tumults,*' he thought admirably well drawn up, as well as that for the parliament; but added, with respect to the first of the two, that he never in hearing it could divest himself of the analogy between '*Abate their pride, assuage their malice,*' and the line in the song of '*God save the King,*' '*Confound their politics, frustrate their knavish tricks.*' I observed, that Pitt was constantly taking down and quoting from *Lucan*, of which author he appeared to be extremely fond. Nothing could be more playful, and at the same time more instructive, than Pitt's conversation, on a variety of subjects, while sitting in the library at Cirencester. You never would have guessed that the man before you was prime minister of the country, and one of the greatest that ever filled that situation. His style and manner were quite those of an accomplished idler.—*Lord Fitzharris' Note Book for 1805—1806.*"—vol. iv., pp. 341—347.

After the death of Mr. Pitt and the accession of the Talents' administration, there is little to notice till we arrive at the celebrated attempt to inveigle the king into the first step towards a concession of what were called the Catholic claims, which ended in the dismissal of that arrogant and fraudulent ministry in whose detection and discomfiture Lord Malmesbury took more part, as we have already hinted, than was commonly supposed.

"On the 9th of march, [1807,] I found that a bill was actually preparing, evidently as a sort of preliminary step to other bills still more explicit, to take off the restrictions now existing against the Catholics. The bill in the first instance was stated to be one that had no other object in view than to give the Irish Catholics, serving in Eng-

land, the same security against the pains and penalty of the law against Popery as they enjoyed in Ireland by the bill of 1793, which bill enabled them to hold commissions in the army as far as the rank of colonels.

"The Union made these regiments liable to serve in England and Scotland, and the act as it now stood, (they said,) gave them security in Ireland only. This appeared a just measure if pursued, and one not to be opposed.

"To this bill the king did not object, and in this shape it first appeared in the house of commons, as a clause attached to the mutiny bill, of which it was naturally to make a part. But ministers finding this go down with scarce any remark made upon it, thought they might go a step further; they withdrew the clause to the mutiny bill, and substituted in its room a bill which, by one stride, gave to the Catholics in every part of his majesty's dominions the privilege of entering into the army or navy, of holding any rank in either, and of being allowed to attend their own places of worship. This gave rise to a very spirited debate, in which Perceval, with great force and ability, showed to the house the radical alterations such a measure would make in our constitution, and the dangerous innovations with which it would be attended both in church and state. Government was violent in support of it, and Lords Howick and Temple talked vehemently.

"Strong symptoms, however, soon appeared that they met with opposition in the closet, as the second reading of the bill was postponed from day to day. On Wednesday, the 11th, the king came to town, and saw his ministers as usual at the queen's house, to whom, (it was told us,) he expressed himself very distinctly, that to such a measure he never could assent."—vol. iv., pp. 358, 359.

At this crisis Lord Malmesbury—forgetful of all his former indignation against Lord Auckland for a like conduct—urged the Duke of Portland, with whom he had always maintained his early relations of confidence, to communicate to the king his grace's sympathy on what he heard of his majesty's feelings on this subject, and to acquaint him that if he should be driven to extremities by his present ministry, there were others who were ready to undertake the responsibility of office on the adverse principle. This letter was dated the 12th of March, 1807; but before it was despatched—indeed before it was written out fair—the king himself had anticipated its advice by sending for Lord Grenville, complaining of the deception attempted to be practised on him, and declaring that he never had consented, and never would consent, to Lord Howick's bill. The Duke of Portland's letter arrived no doubt opportunely to confirm the king's resolutions, which were also supported by some of the existing government.

"The king said the prince had come down on purpose on Saturday, [March 14,] to declare his intentions of acting and speaking against the bill; that the chancellor (Erskine) has also been from the beginning against it, as well as Lord Ellenborough and Lord Sidmouth. This last he said had behaved handsomely."—vol. iv., p. 373.

And upon this the king gave the Duke of Portland *carte-blanche* for forming that administration which, with many serious modifications, and the sudden or premature deaths of no less than five of its leaders—Portland, Perceval, Londonderry, Liverpool, and Canning—and many vicissitudes

of difficulties and prosperity, terminated the most perilous, but eventually the most glorious, war recorded in our annals by the most triumphant peace—and may be said to have lasted till, by a series of mistakes and misfortunes, it was led—as always happens to a party too long and too completely prosperous—to terminate by suicide an existence of five-and-twenty years. In the Duke of Portland's ministry Mr. Canning received the foreign seals—Lord Fitzharris became his under-secretary—Lord Granville Leveson went as ambassador to Russia—and Lord Malmesbury, confidentially consulted by Mr. Canning, brings down to the battle of Wagram and the convention of Cintra—but with little detail and no novelty—his summary of our foreign and domestic transactions.

"Here," says the editor, in his parting words—

"Here Lord Malmesbury appears to have closed this Diary.

"Of the Journal which I have published, and which composes this fourth volume, it may be said that it contains much matter already known to the reader. I have not suppressed it on that account, because I think that no corroborative evidence of history can be produced so unsuspecting as a diary, in which events and conversations are regularly recorded within a few hours of their occurrence, and that by an intelligent observer, (like Lord Malmesbury,) whose personal ambition has been satisfied with high rewards, or arrested by incurable infirmity. The man who is in this position, having nothing to hope or to fear, and writing for no immediate purpose of the day, will probably relate history with as little excitement or prejudice as can possibly be found in any active mind."—vol. iv., pp. 411, 412.

To some of these last observations we have by anticipation replied in the distinction we took between the sincerity of the journalist and the accuracy of the facts or justice of the opinions he records: with that reservation we grant to the noble editor all the merit that he claims for his grandfather, who is beyond doubt entitled to as much credence as any *journalizing* politician and *quidnunc* can be entitled to. But however trustworthy the author may personally be, it by no means follows that we are to give him that kind of implicit confidence which the editor seems to challenge. In the first place, he is very often deceived by a second-hand narrative of facts; but even when the naked fact is true, it may be so disguised by being clothed in black or in white as not to be recognizable. Of such a diary it may be said, as the Stoic said of human life in general—*ταρώσαι τοὺς ἀνθρώπους οὐ τὰ πρῶματα, ἀλλὰ τὰ περὶ τῶν πραγμάτων δογμᾶτα*—no one alive would, we believe, be much disturbed by any of the facts recorded by Lord Malmesbury if simply and accurately narrated, though great and serious pain has been inflicted by the color that he gives them and the opinions which his grave authority pronounces upon them. No man, however honest, or even kind-hearted, can be free from temporary impressions and personal prejudices—which, though they should have only flashed momentarily across his mind, stand permanently *Daguerreotyped* in his Diary—so that truth itself becomes an auxiliary to falsehood. On the whole, we are bound to say, this publication seems to us to be in principle wholly unwarrantable; that as regards either political events or personal character, it would be in general a very fallacious guide; that any historical value it may have is nearly counterbalanced by the false im-

pressions it so frequently creates; and, finally, that the confidence and security of private life—the great foundations of society—are seriously compromised by a precedent, which is the more dangerous from the amusement that it affords, and the respectable names with which it is unfortunately connected.

A MIRACLE!

PENNSYLVANIA HAS PAID!—don't be alarmed—not her debt, but the dividends upon it for February. The event was celebrated throughout the state, as became its strangeness, with ringing of bells, waving of flags, and firing of cannon. Friends looked agape on each other in bar-rooms and railway stations. Drab waistcoats heaved with uncontrollable emotion; mint juleps were gulped like water when the news was told.

In the city of London the excitement was indescribable. Feebly we attempt to portray it in verse, the only medium for description of such a scene. Humble prose limps after the reality with too painful an effort:—

There had been talk of an Express o'ernight;
And London's capital had gathered then
Her merchants and her stock-brokers, and fright
Was in the features of her moneyed men.
A thousand eyes looked askingly; and when
The whispered news one bold man dared to tell,
Holders of stock looked pale, then red again,
And most were of opinion 't was a sell—
But hush! hark! That report from Bow to
Clerkenwell!

Within an office hard by Lendenhall
Sate an extensive holder; he did hear
That news, perhaps, the earliest of all,
And but pooh-poohed it when it met his ear.
And when "the Times" declared the pay-day
near,
His books, more truly, told their tale too well;
Which show'd he'd lost two thousand pounds
a year,
And left stock on his hands he could not sell:
He rushed on 'Change,—found that they paid—
and fell!

And men came buying in hot haste—indeed,
Their old dishonesty some folks did bar
From buying as they else had done with speed;
And some lacked means "for carrying on the
war."

But on the whole they bought more freely far
Than might have been expected from the way
That Pennsylvanias had stood under par—
While brokers sought "The Cock" across the
way,
And whispered with white lips, "By Jove, they
pay, they pay!"

Punch.

LEGAL CRITICISM.—Mr. Sergeant Hill, disputing once with a young pupil who contended for the accuracy of Richardson's description of love in *Clarissa Harlowe*, the learned sergeant alleged that Richardson was anything but an accurate man; and, in proof of his assertion, asked the young student if he had read *Clarissa's* will; and added, "You will find there is not one of the uses or trusts in it that can be supported."

From Punch.

MR. CAUDLE'S SHIRT-BUTTONS.

"THERE, Mr. Caudle, I hope you're in a little better temper than you were this morning! There—you need n't begin to whistle: people don't come to bed to whistle. But it's like you. I can't speak, that you don't try to insult me. Once, I used to say, you were the best creature living: now, you get quite a fiend. Do let you rest! No, I won't let you rest. It's the only time I have to talk to you, and you *shall* hear me. I'm put upon all day long: it's very hard if I can't speak a word at night; and it isn't often I open my mouth, goodness knows!

"Because *once* in your lifetime your shirt wanted a button, you must almost swear the roof off the house! You *didn't* swear! Ha, Mr. Caudle! you don't know what you do when you're in a passion. You were not in a passion, wer'n't you? Well, then, I don't know what a passion is—and I think I ought by this time. I've lived long enough with you, Mr. Caudle, to know that.

"It's a pity you haven't something worse to complain of than a button off your shirt. If you'd *some* wives, you would, I know. I'm sure I'm never without a needle-and-thread in my hand. What with you and the children, I'm made a perfect slave of. And what's my thanks! Why, if once in your life a button's off your shirt—what do you cry '*oh*' at!—I say once, Mr. Caudle; or twice, or three times, at most. I'm sure, Caudle, no man's buttons in the world are better looked after than yours. I only wish I'd kept the shirts you had when you were first married! I should like to know where were your buttons then!

"Yes, it is worth talking of! But that's how you always try to put me down. You fly into a rage, and then if I only try to speak you won't hear me. That's how you men always will have all the talk to yourselves: a poor woman is n't allowed to get a word in.

"A nice notion you have of a wife, to suppose she's nothing to think of but her husband's buttons. A pretty notion, indeed, you have of marriage. Ha! if poor women only knew what they had to go through! What with buttons, and one

thing and another! They'd never tie themselves up to the best man in the world, I'm sure. What would they do, Mr. Caudle? Why, do much better without you, I'm certain.

"And it's my belief, after all, that the button wasn't off the shirt: it's my belief that you pulled it off, that you might have something to talk about. Oh, you're aggravating enough, when you like, for anything! All I know is, it's very odd that the button should be off the shirt; for I'm sure no woman's a greater slave to her husband's buttons than I am. I only say, it's very odd.

"However, there's one comfort; it can't last long. I'm worn to death with your temper, and shan't trouble you a great while. Ha, you may laugh! And I dare say you would laugh! I've no doubt of it! That's your love—that's your feeling! I know that I'm sinking every day, though I say nothing about it. And when I'm gone, we shall see how your second wife will look after your buttons! You'll find out the difference then. Yes, Caudle, you'll think of me, then: for then, I hope, you'll never have a blessed button to your back.

"No, I'm not a vindictive woman, Mr. Caudle; nobody ever called me that, but you. What do you say? Nobody ever knew so much of me! That's nothing at all to do with it. Ha! I would n't have your aggravating temper, Caudle, for mines of gold. It's a good thing I'm not as worrying as you are—or a nice house there'd be between us. I only wish you'd had a wife that *would* have talked to you! then you'd have known the difference. But you impose upon me, because, like a poor fool, I say nothing. I should be ashamed of myself, Caudle.

"And a pretty example you set as a father! You'll make your boys as bad as yourself. Talking as you did all breakfast-time about your buttons! And of a Sunday morning too! And you call yourself a Christian! I should like to know what your boys will say of you when they grow up? And all about a paltry button off one of your wristbands; a decent man would n't have mentioned it. Why won't I hold my tongue? Because I *won't* hold my tongue. I'm to have my peace of mind destroyed—I'm to be worried into my grave for a miserable shirt-button, and I'm to hold my tongue! Oh! but that's just like you, men!

"But I know what I'll do for the future. Every button you have may drop off, and I won't so much as put a thread to 'em. And I should like to know what you'll do then? Oh, you must get somebody else to sew 'em, must you? That's a pretty threat for a husband to hold out to a wife! And to such a wife as I've been, too: such a negro-slave to your buttons, as I may say! Somebody else to sew 'em, eh? No, Caudle, no: not while I'm alive! When I'm dead—and with what I have to bear there's no knowing how soon that may be—when I'm dead, I say—oh! what a brute you must be to snore so!

"You're not snoring! Ha! that's what you always say; but that's nothing to do with it. You must get somebody else to sew 'em, must you? Ha! I should n't wonder. Oh no! I should be surprised at nothing, now! Nothing at all! It's what people have always told me it would come to—and now, the buttons have opened my eyes! But the whole world shall know of your cruelty, Mr. Caudle. After the wife I've been to you. Somebody else, indeed, to sew your buttons! I'm no longer to be mistress in my own house! Ha, Caudle! I would n't have upon my conscience what you have, for the world! I would n't treat anybody as you treat—no, I'm not mad! It's you, Mr. Caudle, who are mad, or bad—and that's worse! I can't even so much as speak of a shirt-button, but that I'm threatened to be made nobody of in my own house! Caudle, you've a heart like a hearth-stone, you have! To threaten me, and only because a button—a button—"

"I was conscious of no more than this," says Caudle, in his MS., "for here nature relieved me with a sweet, deep sleep."

PUNCH'S NOY'S MAXIMS.

33. *Dolus et fraus unâ in parte sanari debent.* Deceit and fraud shall be remedied on all occasions.—It may be very true that deceit and fraud ought to be remedied, but whether they are is quite another question. It is much to be feared that in law, as well as in other matters, *ought* sometimes stand for nothing.

34. *No man can take benefit of his own wrong.*—This is true enough, though a man may often benefit by the wrongs of other people. Some also suffer from another's wrong, as where a square-keeper, who had been snow-balled, ran after the wrong boy; the right boy, who was really wrong, escaped, and the wrong boy, who was not wrong at all, paid the penalty.

35. *Lex neminem cogit ad impossibilia.* The law compels no one to impossibilities.—This is extremely considerate on the part of the law; but if it does not compel a man to impossibilities, it sometimes drives him to attempt them. The law, however, occasionally acts upon the principle of two negatives making an affirmative, thus treating two impossibilities as if they amounted to a possibility. As, when a man cannot pay a debt, law expenses are added, which he cannot pay either; but the latter being added to the former, it is presumed perhaps that the two negatives or impossibilities may constitute one affirmative or possibility, and the debtor is accordingly thrown into prison if

he fails to accomplish it. In the old editions a case is cited, saying that an obligation to go from St. Paul's in London to St. Peter's at Rome within three hours, would be bad as the condition of a bond, because it would be obviously impossible; but in these days of railroads *in esse* and balloons *in posse*, no judge would venture to lay it down as law, that such a condition would be void on the ground of its being an impossibility. A condition, however, to do a certain act when Waterloo Bridge should return a profit to the original shareholders, would be void at once; for "here," says ALDERSON, B., "the impossibility of the thing is upon the face of it, and stares us in the face, let us look how we may at it."

36. *When many join in one act, the law says it is the act of him who could best do it, and that the thing should be done by those of best skill.*—Thus, if there are six supernumeraries standing on the stage, and one tragedian, during the act of a tragedy, they all join in the act, but it is the act of the actor and not of the supernumeraries. So, if there be nine tailors employed in making a coat, it is the act of one man, "For," says COKE, "if I am asked who made my coat, I cannot answer—SMITH, BROWN, JONES, ROBINSON, DOX, ROZ, THOMPSON, DOBSON, and JOHNSON, though it be true that they have all had a hand in it. But if DOX is the master, and ROZ and the others are the men, I say that DOX made the coat; but otherwise, if ROZ is the master, and DOX, with his fellows, the men, for then I say, marry, it was ROZ that made my coat." By the bye, it has been settled that though property in tail cannot come to a man till he is of full age, a coat in tail may come to a youth of fourteen; and it is not usual to cut off the tail afterwards.

37. *When two titles concur, the elder shall be preferred.*—This maxim has given rise to some dispute, and a curious case was once put in the following terms:—"Suppose I have two sorts of wine, and the titles of both concur, both of them being called red wine, though one happens to be port, and the other elder." It then becomes a question whether the elder is to be preferred, a question, which all the best judges during the evening sittings have agreed to answer in the negative."

38. *By an acquittance for the last payment all other arrearages are discharged.*—Thus, a receipt from your tailor would be, *primâ facie*, a discharge to all your other debts, because your tailor's bill is the last payment you would think of making.

MISPRINTS.—Misprints often strike what are termed unlucky blows. The omission of a t makes the mortal the moral, and the immortal poet stands praised as the immoral poet. We read a short time ago a lamentation on "the frightful increase of morality in the metropolis;" and once saw the advertisement of a treatise on "the blessed immorality of the soul;" we have met with the glory of a conqueror turned into *gory* by the dropping of the liquid consonant; our loyalty has been shocked by the announcement of a "most reasonable attempt on the life of a sovereign;" but, worst of all, we lately saw the Duke of Buckingham described, through the dropping of the dog's letter, as the "Farmer's Fiend."—*Examiner*.

From the Edinburgh Tales.

THE SABBATH NIGHT'S SUPPER.

THEY misconceive the character of this northern land who imagine of its people as a cold, sullen, and ungenial race, shut up from the social charities, and incrustured with self-conceit, spiritual pride, and gloomy bigotry; but they do Scotland, and their own understandings, worse wrong, who imagine that this unsocial and austere national temper is derived from that high-hearted reformed faith which has ever allied itself with the spirit of independence, and the sternest assertion of the principles of civil liberty—which has disdained to truckle to expediency, and braved every peril in maintaining the charter wherewith God has made man free.

The sabbatical observances of Scotland, especially, have been misrepresented and ridiculed by those who are so inconsistent in their boasted liberality as to contend that the Scotsman, by constitution a man of staid deportment and serious thought, however warm or enthusiastic his inward feelings may be, is a bigot and a fanatic, who would blot the sun from the firmament, and enshroud the face of nature with universal gloom; because he will not demonstrate his high enjoyment of the *Day of Rest* by frisking or carousing—cricketing with the peasant of England, or capering under the green trees with the working-man of France. They will not pause to consider that, to him, the highest enjoyment of leisure, independently of religious feelings altogether, may be, "to commune with his own heart, and be still;" or, the season of public worship past, to live apart in unbroken communion with those to whom his heart is knit by the strongest ties of duty, and the sweetest claims of affection. The gay Sunday of the theatre and the guinguette, and the more boisterous mirth of the tea-garden and the skittle-ground, would, to many a native of Scotland, prove as joyless and burdensome on any day of the seven, as indecent and profane on the Sabbath, which he consecrates to retirement and meditation, or restricts to family intercourse and religious and intellectual exercises; regarding it as time redeemed to the self-examination and inward thought which his early moral and religious discipline have enabled him to employ aright and enjoy profoundly. Nor is it easy to say why liberal politicians and philosophers should almost force the people on modes of enjoyment, on their one day of leisure, which they would consider quite unworthy of their own higher mental cultivation and pursuits.

One Sabbath for the rich, and another for the poor—restraint upon the scanty enjoyments of the hard-toiling many, and impunity and bounty to the luxurious pleasures of the wealthy few—are at the same time so directly subversive of the plainest precepts and injunctions of that religion which recognizes man's complete equality in civil rights and in moral obligation, that we have not one word to say for prohibitions that must press unequally.

These remarks detain us too long from our story, which we meant to preface by the assertion, that the types of neither the Scottish Presbyterian, nor the English Puritan, were of the austere, sullen, and cynical character which their adversaries have alleged. John Knox himself kept a cellar of good wine, and knew how to use as not abusing it. From the "Memoirs of Colonel Hutchison," and

many other sources, we learn that the Puritans were, in domestic life, accomplished and enjoying, as well as learned persons. Those who insist that our national Sabbath must be gloomy, because, in despite of nature, we do not, like Grimm's German Baron keep jumping over chairs and tables all day "to make ourselves lively," are but shallow philosophers.—One redeeming social feature even they might acknowledge in our Day of Rest—THE SABBATH NIGHT'S SUPPER. And we trust that the venerable custom is not falling into desuetude.

The family *re-union*, and stated feast, was at first almost a necessary consequence of long journeys to distant kirks, while the population of the country was thin and scattered, and of those preposterous and interminable diets of sermonizing, which made Sunday literally a fast-day, until the evening. Then, indeed, the kitchen-fires were lighted up—then the flesh-pots seethed and diffused a savory steam, or the *broche* spun round in the rural *Manse*, and in all the *bien ha'-houses* in the parish, or comfortable dwellings "within burgh." At the close of his hard day's work, the reverend laborer was entitled to his social meal, of better than ordinary fare—"a feast of fat things"—hospitably shared with the chance guest, the modest young helper, or the venerable elder. Nor was there wanting, if such were the taste and temper of the reverend presider at the banquet, the zest of the clerical joke that promoted blameless hilarity and easy digestion. The manse set the custom to the parish. Now, to have insisted that the *douce* minister, with his family, or the decent farmer, with his lads and lasses, should, to show their holyday feelings, first scamper here and there all day—any way far enough from home—and then go out of doors, to frisk, like so many young *maukins*, in the moonlight, would be about as intolerant as to compel the champagne-loving Gallican to swallow, for his especial enjoyment, the smoky-flavored Glenlivet toddy with which the Scotsman soberly crowned the banquet of the Sabbath Night.

In the family of Adam Hepburn of the Fernylees, the *Sabbath Night's Supper* had been a standing family festival for several generations. The little *quiet* bustle of preparation among the women, the better fare, the more inspirited looks, the expanding social hearts, had become a thing of inviolate custom, following the solemnities of family worship as regularly as the observance of that domestic ordinance. The venerable head of the house would then tell of the times when Cargill, and Renwick, and Rutherford, and other potent divines of the evil times, fathers and mighty men in Israel, burning and shining lights in a darkened land, had, when fleeing before the bloody and persecuting house of Stuart—from whom the curse would never depart!—by their blessings and their prayers hallowed the hospitalities which they shared in this very dwelling; and that although the then inmates of Fernylees had been proscribed, and often severely mulcted, for harboring the men of God, their substance had rather increased than diminished under this oppression, which they felt, not for themselves, but for the faithful of the land, and the afflicted Church of Scotland, tried in the furnace.

No one had ever listened with more attention to these noble tales, of doing and daring for conscience' sake, than Charles Hepburn, the youngest

son of the family of Fernylees, who was born to admire with enthusiasm, but not yet to emulate, the virtues of those heroic sufferers.

The elderly female servant who superintended Adam Hepburn's household, had been more than usually provident of the creature-comforts destined to cover his board on the particular night on which our story opens. The circumstances of the family made it a time of more than ordinary tenderness and solemnity. The following morning was to witness the final breach and disruption of all that now remained to be taken away of the young props of the roof-tree of the house of Fernylees. The elder daughter, who had borne the chills of celibacy, ten years after her three sisters were married, was to leave the home of her youth to sojourn, as her old father in his prayer expressed it, in the allusion he made to her circumstances as a bride, in the tents of strangers. But it was the going forth into the evil, unknown, and dreaded world, of one who from infancy had, by his fascinations and his very errors, excited far more of fear and of hope—one over whom his father's heart yearned while his spirit travailed—that the old man dwelt, in his devotions, with a touching and simple pathos, and poured forth his feelings in that scriptural language and imagery familiar to his lips, replied to by the low, involuntary sob of a married sister of the youth who was the object of these fervent petitions, and by the sympathetic chord touched in the staid bosom of Tibby Elliott, the above-mentioned elderly serving-woman. The contagion even spread to old Robin, the shepherd.

When the worshippers rose from their knees, and turned to the neatly-spread table, on which was already laid the apparatus for the feast, the aged father, sinking in his high-backed chair, shaded his thin temples with his hand; and remained silent, as if his spirit were yet within the veil.

Charles Hepburn retired to the porch with his married sister—they were silently, hand in hand, standing, looking out upon the stars—when the ancient maid-servant appeared:—and “O Charlie, my man,” was the whisper of the motherly Tibby, as drying her eyes with her apron, she passed out into the kitchen, which was in a wing of the tenement; “My man, Charlie, if ye be not a good *bairn* now.”—She had gone on before Charles could reply, if he had been inclined or able to speak.

Tibby Elliott was on this night a woman cumbered with many cares. “Gie ye the *broche* a twirl, Robin,” was her first cry.—“I would no like, nor you either, but to see things right and mensfu’ in the Ha’ House o’ the Fernylees, and a son and a daughter going in the same day frae under its roof-tree.—Fetch down that bowen o’ eggs, Robin; we’ve have a drappit egg with the stoved eroecks, the breed o’ Charlie’s sprangled game hens he was so proud of langsyne, poor callant. But, oh, man! heard ye ever the auld Master sae powerfu’ in intercession as this night? It’s weel to be seen who lies next his heart’s kernel—his motherless son!—And no other wonder; for, with all his faults—and they are neither few nor far to seek—a better-hearted youth, of the name, never crossed the door-step of the Fernylees in all its generations.”

“If ye gie him a’ his ain way, and keep his pouches routh o’ siller,” replied the shepherd, who was of the species of dry humorists not rare in Scotland in his condition.

“And what for should he no’ have his ain

gait, and gold in gowpens?” cried Tibby, who, by the way, was in general much less indulgent to the faults of Charles than was her friend the shepherd, who had loved him from the days of fishing with a crooked pin, and shooting with bourtree guns, though he knew, what indeed was no longer a secret, that the youth possessed a fatal facility and unsteadiness of character, already yielded to to an extent that alarmed those who loved him best, for his rectitude as much as for his worldly prosperity.

It is not uncommon to find in a large family one peculiarly gifted child, to endow whom nature seems to have robbed the others of genius, beauty, and attractiveness. Charles Hepburn, by seven years the youngest, was “the flower of the flock of Fernylees,” loved, indulged, spoiled, as far as a gracious temper and a generous heart will spoil; and that, alas, was in his case far enough! He had been the caressed plaything, the petted child, the pampered school-boy of his brothers, but particularly of his younger sisters. But at the age of twenty-four, the overweening affection of his aged father alone remained unimpaired, increased, deepened by the very causes which alienated other hearts. He who had the most suffered, still loved the most. Nor to a stranger did this seem wonderful. Look in the open, genial, and handsome countenance of Charles, and his besetting sins could not be imagined of very deep dye; spend with him a quietly social, or brightly convivial hour, and all errors or defects of character had disappeared before the charm of his manner, and were forgotten or denied to exist. Yet their undeniable existence had crushed and grieved the spirit of his venerable father, and fallen hard on the shortened means that were to sustain his old age in humble independence. Nor was Charles unaware of any part of this; and the reproaches of his elder brother, a man of quite opposite temper, or the affectionate remonstrances of his married sister, were less severe than his own frequent bitter self-upbraidings. Now he stood on the threshold of a new life. Hope was once more dawning upon him, after repeated disappointment, not the less afflictive that it was self-caused; and his sanguine, bold, and happy temper rose to meet the new crisis.

Charles had received what is usually termed a good education. But it could not have been the wisest, for its early fruits were not soul-nurture, nor wisdom and peace. He had been highly distinguished at the University of Glasgow; and his father, who had in his own heart early devoted him to the service of the altar, secretly rejoiced in the hope of seeing him an ornament of the church. But his natural abilities and advantages of education had not yet been improved even to any worldly purpose.

“To throw all his lear to the cocks, and leave us!” said the old shepherd, while Tibby and himself discussed the circumstances of the family and the prospects of the cadet, with the freedom assumed by all menials, and justifiable in old attached domestics:—“It is grieving.”

“And would ye have had him play the hypocrite—pretend to a gift and a call to preach the gospel—when it’s ower weel kent Rob Burns’ light-headed ballads aye came far readier to Charlie than the Psalms of David in Metre,” cried Tibby Elliott, honest indignation giving energy to her tones, as on her knees she ladled or fished up the salted goose and greens, that

were to act *vis-a-vis*, to her stewed eerocks, *Anglice*, chickens.

"Houts, tuts, woman; yer are owerly strait-laced for this day o' the world; what would have ailed Charlie to have graned away among the auld leddies till he had gotten the CALL, and the patron's presentation too, and a good sappy down-sitten, when, I daursay, he could have seen the wisdom o' being a wee bit twa-faced, like his neighbor ministers, and on his peremptors before folk ony way. With eighteen or twenty chaldier victual stipend, a new Manse, and a piece gude glebe-land, it's no sae dooms difficult to be a douce parish minister as ye trow, Tibby. I would undertake the job myself for half the pay. Gi'e our young chevalier a black gown and Geneva ban's, and let him alane for a year or twa to settle down, and I'll wad he's turn out a great gun o' the gospel."

"Ye profane knave!" cried Tibby, shaking her fist in the face of her old friend, between jest and earnest: "Have ye been reading Tam Fen, [Paine] that ye speak sae lightly o' ministers! Mr. Charles, with all his backslidings, is no sae far left to himself as to lay a rash, uncalled hand on the ark—and the Lord will bless him for it. He is the bairn, as I can testify, o' many a secret prayer. I do not misdoubt to see him the grandest merchant in a' Liverpool yet. Sore trial as it has been to the kind, gude, auld Maister, crossed in his pride, and spulyied in his purse, to see Charles stick in the wark o' the ministry.—But redde the gait there, till I carry ben the supper."

"Ye like a' to make a sicker bargain you uncogude folks, Tibby. A sappy foretaste here, and a —"

"Now Robin, ye radical, hold the scorning tongue o' ye;—would ye see the Maister scrimpt o' his Sabbath night's supper, wi' a' his brains happy about him!"

"That would I not, lass; though I might just as weel like the auld time when rent was light, though woo' less by the stone, and when the man and the woman sat at the master's board-end. I wish the auld Maister no scant measure o' a' good things. May blessings be multiplied on him and his. May the upper and the nether springs be his portion! and his also, the thought of whom lies heavy on his spirit, this night!"—The old man reverently lifted the bonnet off his silvered head as he uttered these good wishes for his master; to which the friendship and daily intercourse of threescore years gave the fervor of a prayer.

In a lighter tone, Robin added, nearly as much ashamed of strong, or deep emotion, as if he had been a man of the world instead of a shepherd of the Border hills,—“We can a' take precious good care o' ourselves, Tibby; save just the auld Maister himself, and the young Chevalier. There's a canny Mr. Gilbert, our auldest hope,—let number one alane to see after him. And as for *mim* Miss Mysie, I'll wager she's thinking more than this night, Sabbath though it be, of her bridal fal-als, and the blankets and sheets she can *riev* frae the Fernylees, to her new name, and of the hundred more pounds o' tocher she should have had, had so much not been spent on Charlie's learning, than o' the father's house, and the kindred she's leaving, and the witless, glaiket brother she is parting from."

Tibby could not dispute this affirmation. With the goose smoking on the *assiette*, between her

hands, she halted to remark, that “The deadening o' natural affection, the sure sign o' the rampant growth of pride, prodigality, and the love o' filthy lucre, was among the sorest of the defections of these sinfu' times; when gear sindered the hearts nature had made the sibbest.”

The time was gone by, when the man and the woman sat at the board-end of the house o' the Fernylees; but on this night of peculiar solemnity, the old respectable pair who occupied the kitchen, were invited into the parlor to drink prosperity to the departing inmates; the other servants were on the new system, lodged in bothies, save one young girl, Tibby's aide-de-camp. This invitation was made on the motion of Charles, who was himself the bearer of it, and who returned with Tibby under his arm, smirking and smoothing down her newly-donned clean apron, Robin Steele following, with his queereast, funniest face, and his broad blue bonnet, *en chapeau bras*. Cold, and half-offended, though the bride-elect might look from under her dropt eyelids, the countenance of the auld Maister, and even those of the married daughters of the family, brightened in welcome of this addition to the party. Robin's *Young Chevalier* diligently filled the glass of Charles' *Greysteel*,*—such were their old caressing names for each other—caressing after the humorous fashion of Scottish wooing, of “nipping and scratching.”

The heart of the patriarchal farmer, at the head of the board, appeared to become lighter, for the whispered, half-heard, kindly jibes, passing below the salt.

“What can I do for you, Robin, and for you too, Tibby,” whispered Charles, “in yonder far-away big town?” The considerate maiden paused.

“Send her a sure account o' the state o' the gospel in Whirlpool,” whispered Robin, smiling, and winking. “And him,” retorted Tibby, snellily, “be sure ye send him a *sound prent*,” (Robin's name for a radical newspaper,) “showing how the nation is going to wrack, and the woo' rising.”

“E'en let it be sae,” rejoined the shepherd laughing. “That is, if it cost ye no expense. I'm not particular about the age, if the doctrine's *sound* when it comes; the whig *prents* are grown as wersh and fuzionless as —, what we cannot tell, for the conversation swelled into a higher key, and became more general and lively. Charles was allowed to replenish the punch-bowl once; but the motion for another was promptly opposed by Tibby, and quietly overruled by the Master. And the youth, just beginning to taste “the sweet o' the night,” wished Sunday had been Monday. It was, as Robin Steele afterwards sorrowfully remarked, the foundation of all his faults, that “He ne'er kenned when to stop.” Long before the conviviality had reached the pitch to which Charles was attuned, the table had been cleared, and the “Big Ha' Bible” again placed upon it. Mr. Hepburn requested, on this night, that his friends should sing with him and his children, the scriptural paraphrase of the chapter which he called on his son, Charles, to read, the vision of the Patriarch, as he journeyed to Padanaram—the covenant pillar of Bethel.

The devotional feelings of Charles Hepburn, though he had made shipwreck of his intended

* *Greysteel*, the name, few natives of Scotland need be told, given by James the Fourth, when a boy, to the Douglas. The young Pretender was called the *Chevalier*.

profession, were still as warm and excitable as his convivial sympathies. When that beautiful hymn,

“O God of Bethel,”

was sung, which so powerfully blends human charities with heavenly trust, every fibre of his frame was vibrating. Repelled by the seeming coldness of those around him, who could now, as he scornfully thought, quietly say good night, and retire to bed, he wandered out beneath the stars. The very natural thought rose as he gazed around: “What shall have occurred to me, before I look again on Fernylees, and share my dear *Father's Sabbath Night's Supper*?”

There would probably have appeared little beauty in the scene on which the moon was now rising to any one whose eyes had not, like those of Charles, first opened upon this nook of earth. The Fernylees was a rather bare, extensive pasture farm, lying on “the winter-shaded” side of a range of Border hills, near the foot of which, on a gentle ascent, stood the thatched farm-house. A few small arable fields and rushy meadows, stretched out in front and along the holm, by the side of the river, a humble stream, yet not unknown in Scottish song. Around, lay the open pastures, running up into the hills, and covered with patches of fern, and straggling tufts of juniper and gorse, or shelving into hollows and little glades interspersed with natural coppices of hazel, alder, and sloe-thorn. On one hand was a low range of bothies and farm-offices; on the other, about equi-distant, rose, on an airy mound, the barn-yard, exactly on the site of the old Peel-house of the Fernylees. Its massy sunken wall or bulwark was part of the original structure. Four very large ash-trees had remained here, and, save one, thriven, since the times of the Border raids. On the partially blasted ash the tyrant baron of the Fernylees (which was now a fraction of a ducal domain) had hung Judon Ker, a Border thief, whose prowess was recorded in one of Tibby Elliott's ballads. In a nest, or cradle, amid its withered branches, the boy Charles had found an out-look far up and down the valley, and a place removed from the bustle of the family, in which to con his book in quiet—Charles, the youth, a spot “for ruminating sweet and bitter fancies,” and for a repentance too seldom followed by good fruits.

He once again swung himself up into his old nestling place; and, on the eve of a new existence, cast his thoughts backwards upon his few and evil days, from the time that he had left the University. His course had been a series of errors and of failures in various attempts to obtain a living, alternating with periods of complete idleness, spent often in bitterness, while lounging about his father's farm. Though Charles was but too prone to divide the blame of his misconduct with others, and to find it in any cause save the true one, it was not in a season like this, when unveiled conscience arraigned his thoughts, to listen to her solemn deliverance pronounced on his conduct, that he could deceive himself. His elder brother and sister had treated him with coldness—had scowled upon him as the idle waster of his father's substance, which was robbery of their rights. What he called their selfishness usually raised his indignation; but his feelings were moderate at this hour, and did more justice to his just, if not very generous or cordial relatives. While this train of thought and sentiment absorbed the young man,

his affairs still formed the theme of the kitchen fireside, to which the shepherd had returned to light his pipe, after suppering the steed that was to bear Charles away early in the morning to a spot traversed by the Carlisle mail, and to which his *Greysteel* was to accompany him on the pony.

“I have no brew of this sudden journey, Robin,” said the thoughtful Tibby. “Ye see how ill fit that lad is to take care of himself: anither bowl on a Sabbath night! He's not fit to be trusted frae hame—his wild aits are far from being a' sown yet, or I'm sair mista'en.”

“And no place fitter than the Fernylees to drap them, where I'm sure there's no want of o' geese to pick them up,” said Robin, in a humor between mirth and bitterness. No one foresaw the dangers of his friend Charles' character more clearly than himself; but he saw farther, and looked hopefully to the future effects of the young man's early training, and to the natural strength of his understanding yet correcting errors in whose source were mingled

So much of Earth—so much of Heaven,
And such impetuous blood.

The thick overspreading branches of “Judon's ash,” had for generations formed a kind of chapel to the farm-house of Fernylees. It was the fortune of Charles Hepburn to be now, as it drew on to midnight, the involuntary listener to his gray-haired father's earnest prayers for himself. With feelings he listened, from which we withdraw in reverence, though their fountain was no deeper than the breast of a gay and very thoughtless young man.

The lingering influence of these feelings made him listen with more than ordinary patience and humility, to the final warning and lecture with which Robin and Tibby gratuitously favored him.

“Diuna let wise Mr. Gilbert be casting ye up in our dish,” said the shepherd, appealing to a species of motive, at all times too powerful with Charles.

“And oh, Charlie,” wailed the privileged and now weeping maiden, “be wise now, like a dear bairn, and bring not shame upon the honest house of Fernylees; and the gray hairs o' the maister, with sorrow to the grave.”

Charles could not reply then: but seventeen miles off, and ten hours later, when he shook hands with the shepherd, as the mail came up, he said with the frank cordiality and sanguine confidence that kept the hearts his follies would have alienated: “You shall hear how steady a fellow I am growing, Robin. Don't despair of seeing me, though going out a poor clerk, Mayor of Liverpool yet; while wise Gibby, at home yonder”—The coach-horn drowned the prognostication of the young prophet, whatever it might be, regarding his staid, industrious brother; and he mounted and was whirling over the moor, while his *Greysteel* followed him with glistening eyes.

And now two years had passed over the house of Fernylees, unmarked by any important change, save that Tibby Elliott fancied, with some truth, that her old master looked a dozen years older, and Robin Steele silently remarked the increasing difficulty with which he met the half-yearly rent-day. Frequent and various in the same period had been the shifting fortunes of Charles Hepburn; and flattering, painful, and contradictory the accounts received of and from him. Now all

promised prosperity, and Robin received a half-dozen newspapers by one post; and next time it was heard, from some chance source, that Charles had again lost his employment, or had as usual abandoned it.

Wise Gilbert had married, in the mean while, and brought home his wife; which made Tibby prudently abdicate to avert a virtual dethronement. She retired to a small cottage, in a thriving village, some miles off, the recent creation of the wool of the adjoining hills. In a few months her "kind, gude, auld maister" surrendering his concerns into the hands of his elder son, on a very slender annuity, to terminate with his lease, made the ancient maiden happy, by becoming her lodger, or rather the master of her cottage.

The trusty Robin Steele, who still lived at the farm, often joined their family worship on the evenings of Sundays; and so far as Tibby's means and management would stretch, the SABBATH NIGHT'S SUPPER, proscribed by the more refined manners of the modern lady of Fernylees, was not yet wholly wanting to the venerable auld maister, nor was the health of Charles ever forgotten by Robin. If ever the father spoke of him, whom his thoughts seldom left, it was to these two humble friends that his confidings were made; his fears and hopes, and fears again. In a fit of generous, though somewhat misplaced indignation, Charles, usually a most irregular correspondent, wrote home when he learned the terms on which his father had surrendered his lease, enclosing all of his year's salary that he could realize, fifty pounds.

With what exultation did Tibby carry this intelligence to Robin, that same afternoon, as she saw him wearing the *hoggs* down the braes overhanging the village. Scarcely could he prevail with her to keep from taunting the penurious brother with the generosity of the *prodigal* son:—"Ye wot not lass," Robin said, "the hard bargain and sore strife Gilbert has with a lady wife, down-looking merkates, and the ransom rent of the Fernylees."

Tibby was a woman, and, therefore, though almost always kind, not always perfectly reasonable. "Ye'll see Charlie Hepburn bigg us a braw selated house with a byre at the gait-end, and mak' the auld maister walk down the town with his gold-headed cane yet," was her frequent boast; but till the accomplishment of these prophecies, which sometimes made the saint-like old man smile, he thoughtfully laid aside the greater part of the money sent him, fearing that Charles was not yet past all his expensive follies, and therefore not above want for himself. And he congratulated himself on this forethought, when, after another long silence, it was heard by accident, from a neighboring farmer, who had been at Liverpool to sell his wool, that Charles Hepburn was married! Tibby's first impulse was indignation; but she suppressed her own feelings to spare those of her master. "We'll be sure to get a letter next week," she would say, at the spare weekly Sabbath Night's Supper, to which some old friend or neighbor often came in, uninvited but welcome. "Postage, Mr. Charles knows to be no light charge; ye are aye complaining o' the parliamenters, Robin; will ye get them to take off that post-letter cess that brings sae meikle heart-break to poor wives, widow women, and lanely mothers? But I'se warrant me Mr. Charles, now that he is a married man, with the care of a family upon his

head, is another guess thing. I never saw the wise man yet that marriage did not sober and steady."

Even to such slender consolation the old father would try to smile. Of the new ties and duties Charles had taken upon himself, in a distant land, he knew nothing: but he hoped, and prayed; and his heart revived, and grew strong in its trust, when his son's next letter called upon him to send his congratulations to the gentle English girl who had preferred his Charles to wealthier suitors, and a grandsire's blessing to the new-born infant, named, in pride and fondness, by his venerated name. It had been then that Charles, ever the man of impulse, had written home, and then, under the influence of new-born feelings, he had vowed, on the lips of his child, a future life of wisdom and firmness of purpose—a resolution kept for three long months. At the end of that time his wife requested to add a postscript to his letter home—for Fernylees was still called home—in which she declared herself, though cast off by her friends, for what they considered her imprudent choice, to be, as the wife of Charles, the happiest woman in England. There was that in the phrase, which made the old father fear, that, short as her term of married life had been, it had not all been thus happy. And he was right. The young pair—and the wife was very young—had not been many weeks married, when Charles, by his frequently recurring inattentions and imprudencies, lost an advantageous employment. Then came a season of great hardship and privation, in which everything failed but the affection which mutual suffering deepened between them into unutterable tenderness. Oh, well may the strongest minded of the human race dread the subduing force of evil habit, and guard against the very appearance of evil, when Charles Hepburn, now feeling to madness the folly and cruelty of his own unsteady conduct, and, pardoned times without number, could again fall into error! His final lapse was more pardonable in the immediate cause, than many of his former misadventures, though it chanced to be attended by worse consequences; for, though the least, it was the last drop in the overflowing cup.

Six months before, when sunk in the very depths of misery, shunned by his gay companions, and looking forward to the last extremity of poverty; and when, but for the sake of his wife, he would have fled to the ends of the earth to avoid or amend his fortunes, he once more found employment as an inferior clerk to an extensive company, the senior partner of which was a native of Scotland. Their business was chiefly in the United States. For some weeks the punctuality and diligence of Charles were quite exemplary. Mr. Dennistoun began to hope that the bad business character which his young countryman universally bore in Liverpool, was unfounded or exaggerated.

"New brooms sweep clean," said the cautious Mr. William Smith, a junior partner, promoted from the quill and packing-cord, for industry and attention. He had, indeed, been very unwilling to receive the *branded* clerk, who, among other sins, was understood to have committed that of rhyme. Mr. Smith was right. The old leaven still fermented in the constitution of Hepburn; and simultaneously with the discovery of his superior intelligence in some departments of business, came the painful experience that had been forced upon

all his employers. The temptations of society, pleasure, and what he called friendship, returned with unmitigated force upon their fascinated victim. Three times in the course of the twelve months he had been discharged, and restored upon promises of amendment. The last time to the tears and intercessions of his wife—whom, as a desperate expedient, Charles had humbled himself so far as to permit to plead for him. Mr. Dennistoun pronounced his conduct "ruinous," such as he could not overlook, save for Mrs. Hepburn's sake, just this once. And could Agnes, who loved so tenderly, and hoped so brightly, doubt that now her husband, restored to comfort and respectability, would be *steady*—be all that was wanting to make her, poor and unregarded as she was become, still "the happiest woman in England." Once again evil habit prevailed over the sincere but infirm resolution of Hepburn.

In the bitter cold morning of the 26th of January, 18—, the young wife of Charles Hepburn—and she was still under nineteen—sat in the single poor apartment they rented by the week, hushing her moaning child; and at the same time preparing coffee for her husband's breakfast, to be ready against the minute he would awake. She knew that he slept too long. Her eyes, heavier from a long night of watching than from tears, for of late she seldom wept, were mournfully fixed on her infant, and then a single tear stole down the cheek, thin and sunken from the "peachy bloom" once celebrated in Charles' sonnets. The snow-drift was spinning without, and the twilight was gray and dull enough that morning, in this narrow and mean street of a busy and crowded part of Liverpool.

Agnes had opened but a small part of the shutter, that her husband might obtain another half-hour's sleep after his prolonged revel. The clock of a neighboring church struck a late hour. Starting at the sound, she stole on tip-toe to the side of the bed, and gazed, through now fast-gathering tears, on the sleeper, the *dreamer* whether awake or asleep!—gently pressed her cold lips to his flushed brow—and turned away. Soft as her movements had been, they had awaked the restless slumberer; and she was but seated, with her child in her lap, when he tossed aside the curtain.

"You are up already, Agnes, love:—I'm afraid I kept you up very late last night too; surely you did not watch for me? But what a glorious night, Agnes! how Burns himself would have enjoyed it;—a glorious night! a *Noctes Ambrosianæ*!"

There was no immediate reply.

"Was Burns a married man?" at last whispered the Englishwoman, whose young silvery voice was already touched with sorrow; and she leant her head on the bosom of her child.

"Married! ay, to be sure; have you forgotten 'Bonny Jean,' and the little charming song you made me teach you—'When first I went a wooing of you?'" cried the Scotsman, with some impatience of his wife's ignorance on points so familiar to himself. "You have then forgotten 'Of all the airts the wind can blow,' he went on, in a half-reproachful, half-playful tone.

"Oh, no, no, I have not forgotten that."

"Then, quick, Agnes dearest, get me some tea—not coffee to-day—my throat is parched, and my head aches like a hundred fiends. Fetch your son here, and I will nurse him till you get breakfast; I trust he is better to-day. But when did you get

up, love? I hope you did not sit for me; I dare say it was two o'clock before I got home."

Agnes did not now say how much later it had been, nor yet how long she had held her solitary vigil. She placed the boy in his father's arms, and hastened to procure a small quantity of tea with her almost last shilling. While she moved about the room, Charles, still under the excitement of his revel, talked wildly of the wit, the gaiety, the national feeling, the rapturous conviviality, with which his friends and himself, men of different nations, Scottish, English, Irish, and American, united by the bond of enthusiastic admiration, had celebrated the birth-day of Scotland's immortal bard:—

And the bonds they grew tighter the more they were wet.

He repeated the flashes of Scottish genius which had electrified the banqueters, the bursts of Irish humor which had set the table in a roar. Either the fire and spirit of these sallies had totally evaporated, or Agnes was an unfit recipient. On this morning she, for the first time, could not feel with Charles, or her sympathy was feigned or faint—her smile, for she attempted to smile, forced and languid. Charles, whose sensibility was quick as ethereal fire, felt damped, disconcerted, and became silent.

The neighboring church-clock again sullenly swung forth another hour, with the peculiar heavy sound of bells in a snow-fall.

He paused in playing with and tossing the child, whom, in whatever humor it might be, he always succeeded in making laugh—paused to count the strokes. "Seven, eight, nine"—he started—"ten, eleven!" He threw down the boy, and seized his watch. It had run down amid his jollity. "Good God! is that clock true! Agnes, how thoughtless, how very thoughtless, to let me sleep so long!" Conscience checked the unjust reproach. "I could not, Charles; indeed I could not find heart to awake you while you looked so fevered and flushed—so much to need rest."

"Foolish woman! For this your child may want bread!" He hastily dressed himself, or rather huddled on his clothes, soiled and unbrushed from his revel; while, ready to faint amid the struggles of her various feelings, Agnes tremblingly held the cup of tea to his parched lips, which he but tasted, as with one look fixed upon her, in which burned love, grief, and remorse, he started away. He flew to the warehouse, where he should have been, where he had most unconditionally and indeed voluntarily promised to be, by nine o'clock; to the dock, where the New York packet had lain, in which he was that morning to have shipped a valuable consignment of expensive British shawls, which were only to arrive in Liverpool through the night. It was a duty which Mr. Dennistoun, in a fit of confidence and good-humor, had entrusted to Charles—had especially selected him to manage, as a mark of confidence. The vessel had left the dock—she was out at sea! In a state of feeling very far from "glorious," Charles bent his steps to his place of business with shame and apprehension—not unmingled with self-coademption—striving, in vain to fortify himself with the reflection of how weak it was in Agnes not to have roused him earlier. True, she knew not of his important

engagements; she had indeed scarce seen him for the last twenty-four hours.

The first object that met the eyes of Charles, on entering the dreaded counting-house, was Mr. Dennistoun himself, writing at the desk usually called Mr. Hepburn's. Mr. Smith was similarly employed at his own desk; but the young gentleman partner, the capitalist, lounged over a newspaper. Every clerk was, in his own department, quill-driving as if for life and death; and nought was heard but the rustle of sharp-nibbed pens on paper. The office clock struck the half-hour past mid-day; clocks, his enemies throughout all his life, were this day to be the ruin of Charles Hepburn—living things with mocking voices, taunting his misery. He stood crushing his hat between his hands, by the side of his own desk; and, on his first attempt to speak, the eyes of all the persons present were involuntarily turned upon him, with expressions varying with the character of the spectators—all eyes, save those of Mr. Dennistoun, who never once raised his head. As there was, after five minutes' waiting, no symptom of that gentleman relaxing in his writing, Charles, his brow flushing, muttered, in deep confusion, "I am quite ashamed—quite unpardonable my conduct is this morning, sir." The old gentleman bowed coldly in assent, and continued his writing. "But the Washington has not sailed, though the John Adams has gone. I trust there is yet time."

"Spare yourself all trouble on that account, Mr. Hepburn," said the old gentleman, who could be as stately, when he so pleased, as if bred in a court, instead of a Glasgow counting-house. "The goods are shipped—though tardily, yet in good order. That, sir, became my duty, as I had been credulous enough to believe the Ethiopian could change his skin; weak enough to assume an improper responsibility." He was still writing; and now coolly handed a slip of paper to Hepburn, who, while his eyes flashed, and then became dim, read an order to the cash-keeper to pay instantly whatever arrears of salary were due to him. That was not much, but Dennistoun, Smith and Company had no further occasion for his services! Charles stood at first dumb and petrified; he then attempted to speak, to remonstrate, to supplicate. He thought of Agnes and her boy, and bitter and wretched were his feelings. This dismissal was not merely loss of employment; it was the wreck of the last remains of his professional character. Who would trust any man dismissed in disgrace by the calm and liberal Dennistoun. In reply to his broken solicitation, this gentleman, now inexorable, however kind he had formerly been, without uttering a word, wrote away, merely bowing and waving his hand, in signal to the speaker to be gone. Choking with feelings of pride, of grief now chafed to anger, Hepburn abruptly left the counting-house, and the old gentleman picked up the order he had dropt, and desired the cash-keeper to pay over the money to himself. As Charles passed through the outer-room, the lounging gentleman partner called to him to pay him a compliment on his verses, recited at the festival of the preceding night, which he, an amateur of the muses, had just finished reading, though in business hours. It wanted but this, in the present mood of the unfortunate Hepburn, to madden him outright. He ran out; he passed from street to street; his only distinct thought being by which avenue he could soonest escape from the town. In an hour he

was several miles beyond money-making, many-masted Liverpool, cursing his existence, and the day that had given birth to a wretch whose life was fraught with blighting to all that loved him. An expression once wrung in anguish from his aged father, now haunted him, as one idea will cling to the brain in which reason is failing: "*Unstable as water, thou shalt not excel!*" This he muttered; shouted in his own ears; screamed out in his despair.

The long winter's day wore heavily on with the drooping and ill-boding Agnes; yet she exerted herself to amuse her child, and to prepare such food against her husband's arrival, as her slender means afforded, and such as she conceived best adapted to the state of inanition in which she knew he must return home after his revel and subsequent exhaustion. That he would not return, never once occurred to her, many as were the anxious thoughts over which she brooded. As the day wore later, Agnes became more and more uneasy. Occasionally Hepburn's impulsive zeal had detained him after the ordinary hours of business; and but too frequently he encountered, in the busy streets of Liverpool, "friends, countrymen, and lovers," all joyously met; whom he could not entertain in his own poor lodging, and accordingly adjourned with to a tavern.

In the evening, one or two of Charles' convivial companions, of the previous night, called at his lodging to fight their battles o'er again; but he was found to be abroad, and his wife, usually a very lively person, was "sullen," one young man said; and another, more candid, "in low spirits—and no wonder." Later in the night, a porter called, belonging to the Dennistoun and Smith firm, who was from Charles' native parish, and who felt kindly towards him, and was often helpful to him and his wife in many little matters.

When informed that Mr. Hepburn had not yet come home to dinner, the man looked so blank, that the imagination of Agnes, prone of late to gloomy apprehension, caught fresh alarm, and the simple man was glad to escape from her anxious questionings. Leaving her sleeping child to the care of her landlady, Agnes walked to the extensive ware-houses of Mr. Dennistoun. All was shut up in darkness, and must have been so for some hours. With difficulty she made her way home, where Hepburn had not yet appeared; and now exhausted from want of sleep and of food, and tortured by apprehension, she became so ill, that when the landlady proposed to go to the private residence of Mr. Dennistoun, to obtain intelligence of Charles, no opposition was offered.

The Liverpool merchant was in his splendid drawing-room, enjoying his well-earned evening leisure in the midst of his family, and with a small circle of friends. Among the pleasures of the evening, his favorite grand-child, a girl of thirteen or fourteen, had sung to the old Highland air to which they were appropriated, the unlucky Burns' verses of the more unfortunate Hepburn, which had been so much admired in the newspapers of the morning. Mr. Dennistoun was luckily not aware of the author of Letitia's song, or he might have listened, on this night, with impatience. The old melody, (*Arrie nam badan*), tender at once and spirited, had been first heard by him among the hills of Argyle, more than half a century before. Whether it were in the music, the voice of the singer, or the braes and brackens, and heather-

bells and long yellow broom that mingled in the song, that the spell lay, or, as was more likely, in the whole combination, we cannot tell, but the thoughts of Hepburn, which had hung upon the old Scotsman's spirits all day, returned to him more painfully than ever. Not that he repented what he had done, or of anything save his weak forbearance, and pernicious indulgence of errors of so bad example. Yet a man may be fully acquitted by his conscience, as to the justice of a particular action, and yet be very far from comfortable in his inward feelings. So at least it was with Mr. Dennistoun, even before a message was brought up stairs that a woman was below inquiring for Mr. Charles Hepburn, one of the clerks, whose wife was dying, while he could not be heard of anywhere! The old gentleman became greatly agitated. His first thought was indeed terrific. Those excitable hare-brained geniuses like Hepburn, there was no saying what mad act, when in a desperate mood, abandoned of reason and of God, they might perpetrate! He recalled the appearance of the young man, the wild excitement of hilarity and the fumes of wine scarcely out of his brain, when they must have been succeeded by the fierce extremes of despair and of stinging self-reproach. Late as it was, and in spite of the remonstrances of his family, Mr. Dennistoun resolved to accompany the woman to Hepburn's lodging, and his nephew, the mercantile amateur of the muses, attended him, to take care of him home again. The uncomfortable apartment, and its details, were of themselves full of reproach of the thoughtless and improvident habits of the owner. Agnes, recovered from the fainting fit which had so much alarmed the landlady, on the appearance of the two gentlemen, taxed her spirit to its utmost powers to learn the worst that fate had in store for her; but Dennistoun had neither heart nor nerve, nor could he think it wisdom to say more at this time, to the poor creature for whom he felt so strongly, than that he had seen Hepburn early in the day. And, in a tone of parental kindness, he added, "We are both aware, madam, that our friend Charles is not always the most punctual of men." Agnes sighed. The nephew, who, from delicacy, had not ventured farther than the door of the room, could from thence see that Hepburn's girlish-looking wife, sitting on a low stool by the side of the cradle, was the most meek, pale, Madonna-like, mournful beauty he had ever beheld. Hepburn himself was, he knew, a man of great talents, absolutely a *genius*. He felt the strongest desire in the world to have him pardoned and reinstated. Certainly it was shameful, unkind, disgraceful, to leave so sweet and beautiful a creature pining in poverty in this miserable place, while her husband was revelling, spending a guinea, or perhaps two guineas, on a single dinner.

But even the light that led astray,
Was light from Heaven!

As much from pity for Agnes, however, as from sympathy with her husband's poetical and social tastes, he ventured farther into the apartment; and to his uncle spoke something between excuse and vindication of the absent culprit. Agnes then, first looking eagerly up, her eyes swimming in grateful tears, gave him encouragement to proceed; and he urged his suit till he had fairly exasperated the benevolent, but somewhat impatient temper of his senior, and turned against

himself the very feelings on which he had relied for Hepburn's exculpation and forgiveness. He lauded the *genius* of those men—*Scotsmen*—in whom warmth and exaltation of feeling palliated aberrations unpardonable in the dull, cold-blooded, money-making mortals, who lived by square and rule. "There was," he continued in illustration, "your glorious Burns——"

"Be silent, sir!" cried the old man, in a tone of stern severity, which made Agnes start and shudder, and which at once imposed silence on the speaker. "If there be to young men of genius one warning example more impressive and solemn than another, it is that of the life and death of my noble and unfortunate countryman, ROBERT BURNS. And weak, and shallow, and false are they, who dare plead his magnified or imaginary errors in extenuation of their meaner follies. Have the weaklings any right to plead his faults, who are neither fired by his genius, elevated by his virtues, nor tortured by his passions and his pride! If Burns has left a few careless verses, which unthinking fools construe to their hurt, has he not given them hundreds of lessons of deep and purifying tenderness; of virtue in its loveliest, holiest simplicity! For one careless expression; for the record—perhaps fictitious—of one reckless carouse, may we not, from his writings, learn of thousands of times when, after a day of hard toil, he wandered away into solitude, feeling within him the first stirrings of the hidden strength, 'the gropings of the Cyclop round the walls of his cave'—his own splendid image. Do not the address to a *Field-mouse* and the *Cotter's Saturday Night*, alone, tell us of months and years of meditation on the loftiest and the tenderest themes that can exalt the thoughts of the true poet, musing on humanity—of the rapt spirit, rising 'to Him who walks upon the wings of the wind;' or, in another mood, welling up from its depths of tenderness, over the little wild flower lying crushed in his path! And what chilling years of barren toil and hopeless privation were those!—I declare, before Heaven, it were enough to make that mighty spirit burst its prison-house to hear a crowd of drivelling idiots charge their vices and follies upon the memory of Burns!"

The old gentleman struck his cane upon the floor with an energy that recalled his own senses to the obstreperousness of his tone, and the violence of his indignant rhapsody. An octave or two lower, he apologized to Agnes for his violence, while he acknowledged that this was a subject which always provoked him. "There is," he said, "no doubt something wrong, and in false taste in a few of the braving verses of Burns, and in later things of the same kind from other pens, in which fools read damnation to themselves; but still nothing whatever to excuse those who thus construe them to their own hurt. Those scenes of gaiety, merriment, and extravagant conviviality, or of downright degrading sensuality, certainly never had existence, save in the brains of the writers, or the pages of a book. Shall we blame the genius of Schiller, because a few hot-headed, excitable, and weak-principled lads chose to band themselves as robbers, and take to the forests in emulation of his hero!"

"Yes," cried Agnes, impressively, "the heart-broken mothers and sisters of those misled youths well might blame him whose writings proved so perniciously seductive. Why will not genius insist itself in a nobler cause!"

"My dear madam, this I fear often resolves itself into a simple question of commerce," said Dennistoun, smiling, "which is another category." The conversation reverted to Hepburn; and, kindly enjoining Agnes to take care of herself and her child, and to send Charles to him early in the morning, Mr. Dennistoun took his leave.

This well-meant advice could not realize itself to the extent of the benevolent man's desire. The forsaken Agnes could indeed undress herself and her child, and fold its little fevered frame to her bosom, and for its sake endeavor to take necessary sustenance; but she could not command her tortured spirit to be tranquil, nor her aching eyes to close.

The first tidings of Charles Hepburn were not obtained by Mr. Dennistoun until the fourth day, and then through a Lancaster newspaper; in which, for the humane purpose of giving information to friends, a gentleman answering the appearance of Hepburn, was described to be lying in a violent brain-fever, at a little wayside public-house. His hat and his linen bore the initials C. H., but no papers, or property of any kind, nor means of tracing him, had been found about his person, which had probably been rifled before he was discovered by a traveller passing in a gig. A man had been seen running from the spot across a field; but there was no visible injury on the person of the stranger. The condition of his clothes showed that he must have wandered far; and probably lain in the open air for one or more of those severe nights. It was added, that the incessant, incoherent, hoarse cry of the unfortunate man, was "*Unstable as water, thou shalt not excel.*"

It was a week later, and far up on the topmost heights of the Fernyleas pasture range, that Robin Steele, at all times a much greater newsmonger than his master, read the same paragraph in a Carlisle paper, and instantly left his flock; and only four more days had elapsed before the gray-headed, heart-broken father stood by the bedside of his daughter-in-law and her apparently dying infant, poisoned by the fevered maternal nutriment which should have been its life.

By the prompt care of the humane Dennistoun, Charles Hepburn had, meanwhile, received every attention needful to his condition. He was now in the house of a medical man, in Lancaster, and the strength of his constitution had already overmastered the fever. Of the more enduring and less medicable ailments of his patient, the surgeon knew, and could say nothing, save that it had done Mr. Hepburn immense good to hear that his father was in Liverpool with his wife, and that he might probably join them in a few days. But long years elapsed before that meeting took place.

It was with prospects dark enough that Charles Hepburn, commending, in the most passionate terms, his forsaken wife and his infant to the care and love of his father, and to the tenderness of Agnes the gray hairs he was, indeed, bringing to the grave with sorrow, took a pathetic leave of them both when about to enter, as a private seaman, a merchant vessel preparing for the voyage to India. His letter was dated at Bristol, where the ship was lying. "Since I cannot live by reason," he said, "I must live by rule; since I cannot be my own master, I must be the slave of

another man's will. Need I say, my own Agnes, dearest! best beloved! most injured! that I go, carrying with me but one feeble hope—the hope of once again appearing before you, if conscience shall, after my long, self-prescribed period of exile and probation, say, that there is still peace on earth for the veriest wretch its surface now bears."
